stream which drove the turbine. The substance thus thrown so lightly aside made itself both seen and felt in the most unmistakable manner, by causing a violent effervescence in the water, and giving off an odour that demanded the undivided attention of all those who came within reasonable distance of it. This remarkable action was not without its result. Some more of the substance was at once made and examined chemically, when it was found to be what is known as carbide of calcium, and upon being brought into contact with water it gave off large volumes of acetylene gas. In describing Mr. Willson's discovery of the formation of carbide of calcium in the electric furnace, I must not overlook the claims of M. Moissan. Carbide of calcium is a hard, greyish substance, containing 40 parts by weight of calcium, combined with 24 parts by weight of carbon. It has a specific gravity of 2·26, and the theoretical yield of 1lb. when saturated with water is 5·889c.ft. of gas. In practice, the average yield of good commercial carbide is about 5c.ft. per pound. The evolution of acetylene gas upon water being brought into contact with carbide of calcium is due to the chemical affinities of hydrogen and carbon and of oxygen and calcium. Immediately upon contact a double reaction takes place. The oxygen of the water combines with the calcium of the calcic carbide to form lime, while the hydrogen of the water combines with the carbon of the calcic carbide to form acetylene. Acetylene is a gaseous compound, composed of 24 parts by weight of carbon with two parts by weight of hydrogen, having a specific gravity, as compared with air, of 0·91. When burnt it gives a flame of intense brilliance, the rays being almost identical with those of the sun. It is far superior as an illuminant to any other known gas, 5c.ft. of it giving an illumination of 240c.p., as compared with 16c.p. given by the same quantity of coal-gas. It has an intensely penetrating odour, which somewhat resembles garlic, its strong smell being a very great safeguard in its use, as the smallest leakage would be at once detected. Indeed, so pungent is this odour, that it would be practically impossible to go into a room which contained any dangerous quantity of the gas. Although acetylene has, of itself, so recently become a practical illuminant, it has long been recognised as the source of luminosity in all hydro-carbon flames. We have recently had many alarmist statements as to the safety or otherwise of acetylene gas, and I now propose to deal with it from the point of view of its explosibility, poisonous nature, heat of the flame, and products of combustion, as compared with coal-gas. It is explosive over a slightly wider range than coal-gas. Mixtures of air and acetylene commence to be explosive when containing about 3 per cent. of acetylene, while the proportion of coal-gas in a mixture of air and coal-gas required to make an explosion is about 8 per cent. These figures appear to favour coal-gas in the proportion of 8 to 3; but further inquiry more than nullifies this advantage. In an escape caused by a tap being left on, the average coal-gas burner will pass at least 5 cubic feet of gas per hour, during which time an acetylene burner would only pass ½ft. of gas, while if the escape were caused by a hole in the pipe, the amount of gas escaping would depend upon the specific gravity of the gas; the specific gravity of coal-gas is ·4, that of acetylene is ·9, thus the proportionate amount of gas escaping under similar conditions would be two (2) volumes of acetylene to 3 of coal-gas. It will thus be seen that while if the escape is caused by a tap being left on, the comparison is overwhelmingly in favour of acetylene, if it is caused by a hole in the pipe the two are practically equal. This is without taking into consideration the odour of acetylene, which, as previously mentioned, makes no mistake about giving warning of any escape. An acetylene gas flame only gives off one-fifth of the heat given off by a coal-gas flame. For the generation of acetylene gas all that is requisite is to bring carbide of calcium into contact with water. This must obviously be done in one of two methods, either the carbide may be dropped into water, or water may be allowed to flow into the carbide. Both methods have their advantages and disadvantages. Taking the first principle, that of dropping the carbide into water, from a chemical point of view, it is undoubtedly the best; but from a mechanical point of view it has serious limitations. By dropping the carbide of calcium in small pieces into a comparatively large volume of water, there is practically no rise in the temperature, the decomposition is perfect, and having to bubble through the water the gas is condensed, washed, and freed from impurities. Its main disadvantage from a mechanical point of view is the practical impossibility of making at a moderate cost a small automatic generator that will work in a satisfactory manner. The difficulties are of a purely technical nature, and I do not propose to go into them here. Mr. Dargue considers that very large apparatus should be made on this principle, and that they should not be automatic in action. He has designed an apparatus on these lines. The second principle — that of allowing the water to flow to the carbide—is, for obvious reasons, that most generally adopted, the reason being its adaptability to the construction of generators of a moderate size, designed to work automatically by allowing the water to flow by gravity to the vessel containing the carbide of calcium, and the cutting off of the supply of the same, either by the action of a valve closed by the rising of the gasholder when a certain amount of gas having been made causes it to rise above a certain point, or by the back pressure of the gas when a certain amount of gas has been made. As a result of the automatic operation of these generators, a large storage capacity is not required in connection with them; they can, therefore, be made of a comparatively small size, and at a moderate cost. It is, for this reason, practically certain that most generators will be made on this principle, and it is necessary that we should give our very careful attention to any faults that there may be in this principle, and to the methods in which these faults may be overcome. The conditions given rise to by this method of generator which necessitate special precautions being taken to overcome them (and this is especially the case in those machines where the water is sprayed on to the carbide) are that the heat developed during the reaction is sufficient to pulverise some of the acetylene into liquid products of a tar-like nature, and that by decomposing all the impurities present in the carbide, the gas is rendered extremely impure. These impurities, if not dealt with, are likely to find their way into the pipes, and to cause stoppages in the same. The conditions can be overcome by (1) inclosing the carbide container in a water-jacket; (2) by passing the gas through water or some other purifying agent. As I have previously stated, there are two principles on which generators working on this principle can be designed. They may be made on what I call the "gasholder principle," having the supply of water regulated by a valve opened and closed by the falling and rising of the gasholder, or upon what I will call the "back pressure of the gas principle," in which there is no cut-off between the water and the carbide container, the water being driven back by the pressure of the gas after a certain amount has been made. I have here for your inspection this evening an example of a generator made on each of these two principles—they have both been made, as I said before, in Newcastle, by Newcastle firms. The generator on the gasometer principle is one designed and patented by Mr. W. H. Darge, of 72, Grey-street. The generator on the back pressure of the gas principle is one designed and patented by Mr. F. Smith, of Blackett-street.

COLUMN TESTS.

IMPORTANT tests conducted under the direction of the Department of Buildings of New York City on cast-iron columns and their details, full size, have been noticed by the American engineering Press. No doubt it was a mistake to confine the compressive tests to one side of the column instead of being measured on opposite sides. The Phœnixville and Watertown machines were used. The tests show rather low resistances per square inch of the sections, the areas of which were from 17·4 to 51·5sq.in. The largest columns (5in. and 8in. in diameter) were only 20 times the outside diameter, so that they were not long examples; the shortest was also extremely short. According to the *Engineering Record*, "five of the shortest columns (15in outside diameter) exhibited breaking loads from 29,900 to 32,100lb. per square inch—*i.e.*, about one-third of the ultimate crushing resistance of cast iron in short blocks. This is a far greater reduction than ought to follow from the small amount of what may be called column influence: it is accounted for by such remarks as 'blowholes' and dirt, 'spots,' 'flaws,' and others applied to the surfaces of fracture." Our contemporary refers to the building law of New York, which allows a working load of 11,429lb. per square inch to be used in 15in. columns, but the working load is not to exceed one-fifth of ultimate resistance. The least building load of the six 15in. columns was 24,900lb. per square inch, and one-fifth of that is 4,980lb. These tests show, the *Record* says, that there are cast-iron columns in buildings carrying loads equal to half the breaking loads calculated. If the average of the results of the six 15in. columns be taken, it will be found that the actual safety factor under the loads permitted by the law will be reduced to 2·6 instead of 5. These results are certainly very satisfactory evidences of their strength.

THE SURVEYORS' INSTITUTION.

AT the ordinary general meeting of the above society on Monday last a paper was read by Mr. W. Irvine, on the subject of "Land Survey and Valuation in Northern India," a subject which, although it is perhaps beyond the *métier* of an English surveyor, cannot fail to be interesting as showing what has been accomplished by strictly scientific methods to form a system of land taxation, as compared with the system in our own country, controlled, as the latter is, largely by ancient custom. The author dealt only with a portion of India—the Northern Provinces, with which for twenty-five years he was connected. Land valuation of some sort had, he said, always been practised in India, for the revenue of the ruler had always been derived from a share in the produce of the soil. He was formerly considered the sole owner of all rights in the land except the right of actual cultivation and subsistence therefrom. In cases where the Hindu chieftains had never really been subjugated, the share of the Government took the form of annual tribute or fines on succession. The root idea in native administration was that the whole country was the private estate of the sovereign, and that no distinction ought to be made between the rent and the taxation of the land. Whatever could be screwed out of the cultivator was the due of the State.

There were several methods by which the native ruler recovered from the cultivators his share of the crop. There was the actual division of the grain on the threshing-floor, the State taking two-fifths or half. By this method the land did not require to be measured. Or the standing crop could be estimated, and the Government's share commuted into money. This involved a unit of area, and a calculation of the number of such units in the holding. In the case of superior crops, the rent was fixed beforehand. The determination of the ruler to take his dues in money, rather than in grain, necessitated some system of measurement more or less accurate. In 1793 we made the fatal mistake of fixing the land revenue in Bengal in perpetuity without any preliminary accurate survey, with the result that we received now from 15 millions sterling rental value only as much as from less than half-a-million in 1793—indeed, only from 5 to 10 per cent., instead of the 90 per cent. we expected to take in perpetuity. The assessments of the later-acquired provinces were not permanent, but fixed for 20 or 30 years only, and this system had been adopted since 1795, with varying success. After describing the conditions under which the land is cultivated in the area with which he dealt in his paper, Mr. Irvine said the subject divided itself into three parts—(1) The measurements and maps; (2) Statistical records as to assessment; (3) Fixing of rents between landlord and tenant. The work of setting out boundaries fell upon the Revenue officer of the district, the native sub-collector calling upon the head men of a village to point out a boundary line. If there were no dispute this was temporarily marked out and the agreement signed by all concerned. Where disputes occurred it was often very difficult for the deciding officer to settle them to the satisfaction of the parties, although improved maps were gradually lessening this difficulty. After boundaries were marked out they were measured, and later a cadastral survey was made, the separate districts dealt with being about 1,800 to 2,500 square miles in area. The unit of the cadastral survey in Northern India was the "field"; but with the greatest care the boundaries of these fields were often difficult to

determine, especially as a field held by one tenant and sown with one crop often belonged to different owners. An instance was given where a field of a quarter of an acre belonged to ten owners. When the lands were first assessed, 90 per cent. of the rental was taken as the tax, leaving 10 per cent. for management, and also allowing the owner the profit on the land he held rent free. But this was found to be excessive, and it had been gradually reduced to 50 per cent. plus another 10 for various expenses. The system at present in force, which was to some extent a survival of the old custom, amounted practically to allowing the settlement officer first to fix the amount of the assessment, and then by it to rule what the rent must be. This, experience had taught the author, worked well and equitably. Many more detailed statistics were given in the paper, for which we have not space, but which were listened to by the members with great interest, and which will no doubt form a valuable addition to the *Transactions* of the Institution. A vote of thanks was moved by Mr. Daniel Watney, and seconded by Mr. J. H. Sabin, and, after short speeches by Sir Edward Jenkinson, Mr. Howard Martin, and Mr. Newmarch, was put to the meeting, and carried unanimously.

ARCHITECTS' BENEVOLENT SOCIETY.

THE annual general meeting of the Architects' Benevolent Society was held in the rooms of the Royal Institute of British Architects on Wednesday, the 9th inst., Mr. George Scamell taking the chair in the absence of the president, Professor Aitchison, R.A. There was a good attendance of members, Colonel Robert W. Edis, F.S.A., Mr. Henry C. Florence, Mr. T. M. Rickman, Mr. Sydney Smirke, Mr. J. T. Christopher, Mr. H. H. Collins, Mr. Henry T. Hall, Mr. Wm. Woodward, Mr. W. Hilton Nash (honorary treasurer), and Mr. Percivall Currey (honorary secretary) being amongst those present. Letters regretting inability to attend were read from Mr. Arthur Cates, Mr. Zephaniah King, and Mr. G. T. Hine.

The honorary secretary read the annual report of the council:—The amount received in annual subscriptions during the year was £456 10s., as against £453 8s. in 1896. Four members have withdrawn, and twelve members were in arrear with their subscriptions when the books were closed for the year.

At the beginning of the year there was a balance of £64 10s. 2d. to the credit of the Capital Account, and the amount of bequests and donations received during the year came to £300 17s. 7d. It was, therefore, decided to increase the society's investments by the purchase of £200 Caledonian Railway Four per Cent. Debenture Stock, and the purchase was effected at a cost of £311, thus leaving a balance to the credit of this account of £54 7s. 9d.

A larger number of applications for assistance than usual were made to the society, and considered by the council. After proper investigation in each case the sum of £607 1s. (as against £569 10s. in 1896) was distributed amongst forty-three applicants; and £70 was paid to the Society's three pensioners.

As the exertions of successive councils for many years have succeeded in bringing the amount of the invested capital up to £10,000, the council consider that the society might now increase its present list of three pensions of not less than £15 a year each, to six pensions of not less than £20 a year each. The approval of this step would, the council think, add to the happiness of deserving applicants by the knowledge that they were to receive annually a certain sum. A motion to alter by-law No. 65, so that the above proposal may be carried into effect, was therefore submitted and carried.

The chairman moved the adoption of the report, and the motion was unanimously carried.

Mr. Henry T. Hall proposed, and Mr. Christopher seconded, a vote of thanks to the outgoing members of council.

Colonel Robert W. Edis moved, and Mr. H. H. Collins seconded, the election of the council for the ensuing year of office as follows:—President, the President of the Royal Institute of British Architects; Mr. Arthur Crow, Mr. E. A. Gruning, Mr. G. T. Hine, Mr. Arthur Cates, Mr. Aston Webb, Mr. H. L. Florence, Mr. J. T. Christopher, Mr. Sydney Smirke, Mr. W. Grellier, Mr. E. W. Mountford, Mr. R. St. A. Roumieu, Mr. Wm. Woodward, Mr. E. B. l'Anson, and Mr. E. H. Martineau.

Mr. Forster Hayward and Mr. George Lethbridge were elected auditors for the ensuing year of office.

ORNAMENTAL BRICKS AND TILES.

THE Hartshill Brick and Tile Co. (J. and T. Birks), Stoke-upon-Trent, Staffordshire, have published an illustrated price list, which will enable those who deal with this well-known firm to select their patterns of goods with the gross prices appended. The architect finds it also an advantage in being able to select his patterns of ridge or finial, roofing tile or paving tile, when he specifies this portion of his work. The bricks, tiles, and other goods manufactured by Messrs. J. and T. Birks have excellent qualities: they are sound, well shaped, and of good colour, as all can testify. The ridge tiles made in red, blue, brindled, or Broseley colours, plain and capped, are of various patterns and prices. T-junctions, with grooved ridges for ornamental crestings, quoin tiles for hips, &c., are illustrated. The 12in. "fast ridges" are of many kinds, and the finials display a large assortment for gables and hips. Some of these are suitable for church gables. The roofing-tiles (red, Broseley or brindled) are of several kinds, and of excellent quality; plain tiles 10½ by 6½, 60s. per 1,000, ordinary hand-made; others are pressed. Several sections of blue vitrified wall-coping and stable-channels are shown. Red, blue, and buff paving-tiles, encaustic pavements, terracotta panels, and sanitary ware are other goods shown in this useful list. We notice some very moderately-priced glazed hearth-tiles. These vary in price from 18s. 6d. to 22s. per hearth, and the glazed wall-tiles vary from 16s. to 20s. per yard super. The sanitary goods comprise a few excellent patterns for siphons, with inlets and intercepting traps; and some good cottage hopper closets and traps, closet basins, stoneware sinks, lavatory, and other fittings. The "Builders' Notes" prefixed to the catalogue are useful, and we recommend our readers to send for a copy. One advantage is that gross prices are affixed instead of net prices, from which a trade discount is given.

USEFUL ITEMS FOR BUILDERS, PLASTERERS, PAINTERS, PAPER-HANGERS, &c.

1. A GLUE or putty for cementing water-tanks that are not zinc-lined is composed as follows:—Melt 9oz. guttapercha, and when melted stir in 25oz. pumice-stone powder, and then add 50oz. of Burgundy pitch. Lay this compound (hot) on the inside of the tank, and pass a heated iron over its surface to smooth it. The tank may be filled with acids instead of water, but the wood of it will not be affected by same.

2. Another compound for a similar purpose is prepared by melting together equal parts (by weight) of pitch, rosin, and dried plaster of Paris.

3. A colourless cement for plastering up cracks in structures exposed to the fumes of acids is prepared by mixing silicate of soda with powdered glass to form a stiff paste, and using this paste as a cement.

4. An acid-proof cement is also prepared by mixing either china-clay with boiled linseed-oil, or quicklime with raw linseed-oil, or pipe-clay and coal-tar may be used.

5. To resist boiling acids, prepare a compound of indiarubber, tallow, dry slaked lime, and red lead, as follows:—Melt a sufficient quantity of indiarubber over a sand-bath, and then add 6 to 8 per cent. of its weight of tallow, and well mix in this ingredient by stirring the whole; then add sufficient dry slaked lime in powder to bring the mass to the consistency of soft paste. Finally, mix in 20 per cent. of red lead to make the compound harden and dry.

6. Another waterproofing cement and plaster is prepared by melting separately 50 parts of sulphur, 1 part of tallow, and 1 part of rosin, and mixing the three ingredients while hot, and then adding sufficient ground glass to make a stiff compound.

7. Cement and plaster to resist fumes of nitric and hydrochloric acid is prepared by melting and mixing equal parts of rosin and sulphur, and then stirring in brickdust equal to carry the weight of the compound, or all three components may be mixed in the dry state, and the compound then heated and stirred.

8. A plaster cement that will soften without melting so to adapt itself to the expansion and contraction of metal is prepared by dissolving 1 part of pure rubber in 2 parts of linseed oil, and then stirring in 6 parts of pipeclay.

9. A similar cement for an identical purpose is obtained by melting 24 parts of rosin, and, while this is hot, stirring in 4 parts of dry red ochre, 2 parts of calcined plaster of Paris, and 3 parts of linseed oil.

10. An acid-proof plaster is composed by melting 1 part of guttapercha in sufficient boiled oil, and then stirring in 4 parts of rosin which has been previously melted. Apply this mixture hot to the dry wood or metal, and then go over the surface with a hot iron on purpose to drive the cement into all cracks and crevices.

11. A cement or plaster for oil tanks is prepared by making into a paste with a little water (oil can be made to mix with water by means of lime) 5 parts of litharge (ground fine), 2 parts of unslaked lime, 2 parts of quartz sand.

12. An insoluble plaster or cement for paraffin-oil tanks: Take 4 parts of strong soda lye and dissolve therein 3 parts of powdered rosin. Stir the compound until all ingredients are well incorporated. Allow it to become cold, and then dilute with 5 parts of water, and when all is properly diluted work in 5 parts of plaster of Paris.

13. A solder for metal tanks that are to hold petroleum, kerosene, paraffin, &c.: Melt together 6 parts of lead, 4 parts of tin, 5 parts of bismuth.

14. A waterproof glue for woodwork: Soak 5 parts of glue in water for 12 hours; then pour off any unabsorbed water and dissolve the glue by heating it. Stir in 4 parts of powdered rosin, and when that has melted in the hot glue stir in 3 parts of red ochre.

15. A waterproof cement or putty for metal or wood is prepared by mixing 10 parts (fluid measure) of bisulphide of carbon and 1 part (fluid measure) of oil of turpentine, and then add as much guttapercha as will dissolve in the fluid to a thick paste. The compound so formed is flexible and waterproof, and dries hard as soon as the excess of bisulphide evaporates.

16. A hydraulic plaster or cement is prepared by pulverising 45 parts of limestone, 2 parts of grey clay, 3 parts of black oxide of manganese (all parts by dry measure). After mixing the mass by sieving several times, calcine them at a dull red heat, and reduce to powder; for use, mix with water and a little sand like ordinary mortar. The limestone may be sprinkled with water and allowed to become reduced to dry powder before mixing with the other compounds.

17. Another hydraulic cement is prepared by mixing in the state of powder 25 parts of lime and 3 parts of manganese iron ore, calcine the mixture and then reduce it to powder again. For use, mix with a little sand, and then make into a mortar with water.

18. A waterproof cement for marble and stone is prepared by slaking lime by sprinkling it with water, and while this is slaking curdle some milk by adding a little vinegar to it, strain off the curds from the whey through a cloth, and mix this fresh curd with the slaked lime as it is required for use. This cements sets very quickly.

19. An artificial cement is prepared by reducing to powder and then well mixing by sifting through a fine wire sieve, 6 parts of freshly-ground plaster of Paris, 3 parts of brickdust, and 4 parts of refinery cinders. For use, mix this compound with water, and shortly before the cement is to be used mix thoroughly with 2 parts of sifted iron filings; use like ordinary mortar, but as thin and soft as possible.

20. To render brick masonry waterproof, repeatedly wash the wall with the following solution:—(*a*) 12oz. Castile soap, 1gal. of water; (*b*) 2oz. of alum, 1gal. of water. Brush the wall first with (*a*) solution. The wall should be clean and dry, and the temperature of the air not below 50° Fahr.; laid on boiling hot. Give it 24 hours to dry before applying (*b*) solution, which should be applied when the temperature of the air is 60° to 70° Fahr. After 24 hours repeat the soap and the alum solution, and repeat both solutions alternately at intervals of 24 hours, until the wall is sufficiently impervious to water.

21. A cement for repairing granite is made by reducing to an impalpable powder equal parts of black feldspar and marble dust, and mixing in powdered gum dammar. Heat the mixture until the gum melts, mix the whole by stirring, and then apply to the fractured parts of the granite like putty is used.

22. A cheap cement for many purposes is a mixture of quicklime (unslaked lime) and hot glue.

23. A cement or plaster for paving, such as Lyons asphalte, is prepared by heating to boiling-point 3 parts of bitumen, and then mix in 7 parts of coal cinders. Let the mixture continue to boil until the froth ceases to rise; this should be skimmed off separately. Mix together 2 parts of powdered coke and 26 parts of lime; heat this compound to 575° Fahr., and then mix it with that in the boiler, and finally stir in 32 parts of fine gravel. Continue the heating and stirring until well mixed, and then lay on the pathway, which should have been previously levelled and covered with a layer of foundry cinders or other suitable material. All irregularities should be removed by smoothing the asphaltum while it is hot.

24. Cements and putties for masons' use: Dissolve alum in water until the fluid will not dissolve any more, then mix in this sufficient plaster of Paris to make a stiff dough and bake it; when baked hard and dry grind it to powder, and for use mix with water as wanted, and apply it like plaster. Various pigments may be mixed with it (while in the dry state, after baking and grinding) to make the cement imitate the colour of any kind of marble it is required to cement or join. Joints made with this compound can be polished as smooth as glass, and thus the joint in the marble-work may be rendered imperceptible.

25. A cement or mortar for marble: melt together 8 parts of rosin and 1 part of white wax, and while hot stir in 4 to 5 parts of dry plaster of Paris, and use the compound while hot. The surfaces to be joined should also be heated before cementing with the putty.

26. A slow-setting cement which requires only a thin layer to be used in joining marble is prepared by mixing together, in the dry state, 12 parts of Portland cement, 6 parts of slaked grey lime, 6 parts of sand, and 1 part of kieselguhr (fossil meal or infusorial earth); when these ingredients are all well mixed by sifting, make the compound into a stiff paste with silicate of soda as required for use.

27. Plaster cornices and marble skirtings may be imitated by either of the following compounds: —(*a*) Take moderate sized lumps of native gypsum (sulphate of calcium), and burn them at a temperature below red heat, and at the same time prepare a solution of 1 part of alum in 10 parts of water—using hot water and powdered alum. In this solution steep the warm lumps of gypsum for about fifteen minutes; take them out and allow to drain off all surplus fluid, and then again burn the lumps at a red heat. Afterwards reduce to powder, and when wanted for use mix with water like ordinary plaster of Paris. It will not set so quickly as the ordinary plaster, but be a slow-setting cement, and while pliable, can be moulded in the usual way. When perfectly dry it will become very hard. Dissolve chloride of zinc in water to make a solution having a specific gravity of 1·490 or 1·453, and then put into such solution 3 per cent. of borax or salammoniac (chloride of ammonia). Meanwhile, heat oxide of zinc until it is red hot, and allow it to cool, and when the borax or ammonia salt is dissolved, put in sufficient zinc oxide to produce a compound of the desired consistency; mould the compound while plastic, for when cold it will be as hard as marble, and take a fine polish.

28. A cement to imitate any kind of marble or stone is prepared by taking some of the dust of the marble or stone it is desired to join, and then mixing powdered shellac therewith, and use this as a putty or cement by melting the compound at a suitable heat, and kneading it to a kind of putty.

29. A cement for joining rockwork for grottos, when it is desired that the plaster or cement should not be seen, is at once to hand by using the commonest sealing or parcel-wax, or same can be prepared by melting first 8 parts of common rosin, allowing them to cool sufficiently to permit of 2 parts of oil of turpentine being added without catching fire. Stir up well, and re-heat; and then add 2lb. of good quality rosin (yellow rosin or colophony). When that has melted, stir in and well mix 3 parts of powdered chalk, perfectly dry, and then 3 parts of dry brickdust.

30. Modern Roman cement consists of a mixture of ordinary clay, calcined, and lime, the compound, after mixing, being recalcined. The proportions are 3 of clay to 2 of lime. The original Roman cement consisted of pulvis Puteolanus, or pozzuolana (a ferruginous clay from Puteoli), calcined by the fires of Vesuvius, lime, and sand, mixed with soft water. The pozzuolana only needs to be reduced to powder and sifted. To give the compound greater tenacity, fresh bullock's blood is mixed with it occasionally.

31. Sawdust instead of hair in mortar is a good substitute. The sawdust should be well dried and sifted before use, and then the mortar made by mixing 1 part of cement, 2 parts of lime, 2 parts of sawdust, and 5 parts of sharp sand. The sawdust should be first well mixed dry with the cement and sand; then strew the lime over this, and sprinkle the mass with water, and work up into mortar.

32. A cheap cement is prepared by mixing blast-furnace slag with lime and clay, in the proportion of 2 slag, 5 lime, and 2 clay; calcine the whole, and reduce to powder.

33. Slate may be cemented by compounding boiled linseed-oil, white-lead, and chalk. Make the compound into a fluid condition.

34. To fix iron bars in stone: Melt sulphur, and work in the melted mass plumbago or graphite. This renders the sulphur more elastic. A little boiled oil may also be added, as also sand or rosin instead of the plumbago. Sulphur alone is very brittle.

35. Cement for terracotta: Melt 5 parts of rosin, then add 5 parts yellow wax, and finally add 1 part of sulphur. Lastly mix in half part of furnace slag and quartz sand. Warm the terracotta, and then apply the cement and finish off the joint with powdered terracotta.

36. Turkish mortar: Pound up bricks and tiles, and mix 1 part of this with 2 parts of fine sifted lime, and make into mortar with water to the desired stiffness, and lay on 5in. or 6in. thick between the courses of bricks and stone.

37. Pitch plaster for waterproofing walls: Put 50 parts of pitch into a cauldron and melt it; then add 30 parts of common resin, and when melted mix in 6 parts of red ochre and 12 parts of brickdust, finely powdered. Boil up, and well mix by stirring, and then allow to cool, and then bring the compound to a fluid consistence (so as to spread speedily) by adding about a quarter its bulk of oil of turpentine. Lay the plaster on the wall with a brush or tar-mop.

38. A useful cement for general use is prepared by mixing to a paste with water 1 part powdered slaked lime, 1 part sand, and 6 parts iron filings.

39. White hydraulic cement. Mix 1 part of infusorial earth (kieselguhr) and three parts of chalk free from iron rust, 1 part of a solution of potash or soda water-glass, and make the compound into a dough, and then into bricks, which burn at a white heat, and then reduce these bricks to a fine powder, and mix with water to form a cement when required for use.

40. An insulating cement for electrical fittings is prepared by soaking for 12 hours 11oz. best cabinetmaker's (or white) glue in 2 quarts of water, and when properly softened melt the glue in a glue-pot by heating it with the whole of the water, and then cut up 1oz. of white curd soap (this is a hard tallow soap, made from tallow and soda salts), and when this has been dissolved stir in 52oz. of plaster of Paris, and mix the whole by stirring so as to form a thin paste, which should be used at once, as it rapidly sets and hardens. For insulating electric-light wires and other electrical fittings fixed in walls, this is a most useful element.

41. An insulating cement for glass electrical fittings is prepared by mixing equal weights of red and white lead ground up in oil.

42. Another useful cement for the same purpose is to melt together 5 parts of rosin, 1 of beeswax, and 1 of dry Venetian red.

43. Another cement of a similar kind is prepared by heating together at temperature above boiling water (212° F.), 14 parts of black rosin, 2 parts of red ochre, 1 part of plaster of Paris, all well dried and mixed while warm. Continue the heating until all frothing ceases and the compound flows smooth; then remove the vessel from the fire, and stir its contents until sufficiently cool for use. Half-part of linseed-oil may be added at will.

44. A cement for oil of vitriol and chloride of lime tanks is prepared by mixing thoroughly together equal parts of pitch, rosin, and plaster of Paris.

45. A cement for fastening fittings that are used in apparatus for alkaline fluids is prepared by melting four parts of yellow wax and dissolving this two parts of Venice turpentine, and then stirring in one part of red oxide of iron (well dried beforehand).

46. To repair broken glass electrical apparatus, mix together by sifting two parts of flour, two parts of finely-powdered glass, two parts of finely-powdered chalk, and one part of powdered brick-dust, one part of shredded lint, and then make into a putty with one part of white of egg. Spread this on linen, and lay it on as a plaster over the crack in the glass.

47. A fireproof cement for fireclay-lined furnaces is prepared by mixing freshly-slaked lime into a paste with a concentrated solution of borax, and allowing this cement to become thoroughly dry before using in furnace.

48. A cement for a similar purpose is prepared by mixing into a paste with a saturated solution of borax in water equal parts (or otherwise) of dried clay powdered and powdered brickdust.

49. For furnaces that are required to stand a fierce heat, use either the last-named compound or else a paste made with 2 parts of borax, 2 parts of slaked lime, and 1 part of litharge and water.

50. A cement to withstand a dull-red heat is prepared by mixing plaster of Paris with a weak glue.

51. A cement or plaster resistant to corrosive gases is obtained by drying clay, powdering same, and sifting it, and then gradually working into a paste by rubbing it up in an iron mortar with boiled or drying-oil, the latter being added a little at a time. This cement will not resist heat, but softens thereby.

52. A cement for repairing gas-bags used in limelight and similar purposes, is prepared by adding glycerine to very thick boiled glue, and applying same while warm. If too sticky, strew over it powdered soapstone. This cement is useful for repairing leakages; but for tears or rents put a piece of the material over the rent, and well cover it with glue.

53. A fireproof glue is readily prepared by mixing a handful of quicklime in 4 of linseed oil, and boil to a stiff consistency; then spread the compound on metal or earthenware plate, and dry it in this state by exposure to the air. When wanted for use, dissolve it over the fire as ordinary glue.

54. A universal cement is prepared by dissolving 1 part of rosin, 1 part of Stockholm tar, and 2 parts of guttapercha by heating together.

55. To insulate electrical conductors, use a cement or plaster prepared as follows: Dissolve 26 parts by weight of paraffin-wax (or else beeswax, or spermaceti ditto); when melted, add 3 parts by weight of raw or boiled linseed-oil, and then stir in 66 parts by weight of finely-powdered glass or quartz, and 34 parts by weight of powdered rosin. If this insulating material is to be exposed to the sun, use less wax; and if for underground use, employ a larger proportion of wax.

56. A flexible insulating cement for electrical apparatus or plant is prepared by melting 1 part by weight of mineral wax (paraffin oxycerite), 10 parts of wood-tar, 32 parts of shellac, and 32 parts of dry and finely-powdered asbestos (or else flax, cotton wool, sawdust, or paper. Heat the compound from 100° to 200° F., while constantly stirring. Use less tar for a leading wire, and for a very hard wire omit the mineral wax, use less asbestos (or the other bodies mentioned), and add 24 parts of powdered slate or clay free from iron.

57. An insulator for tape-covered electrical wires is prepared by mixing 1 part of raw linseed-oil with 20 parts of oil of turpentine, and dissolve in this fluid sufficient pure gum-rubber (guttapercha) to form a mixture of the consistency of paint.

58. An insulating cement for a similar purpose is also prepared by melting together by heat 8 parts of yellow wax, 2 parts of beeswax, and 1 part of tallow.

59. Electrical insulators may be cemented to their attachment by mixing sulphur, dry white lead, and plaster of Paris in sufficient glue (solution being made in the ordinary way) to prevent the compound settling quickly.

60. A lute or cement for stopping cracks in iron retorts is prepared by mixing 2 parts of flour, 2 parts of lime (quicklime), and 1 part of potter's earth into a paste, with white of egg diluted with an equal bulk of water.

61. Another lute for the same purpose is prepared by mixing together, in the dry state, equal parts of brickdust and red-lead, and then rubbing

up the mixture to a putty with boiled linseed oil, and add coarse sand to stiffen the mass.

62. A fusible fireproof lute for the same purpose is prepared by rubbing up freshly-slaked lime into a concentrated solution of borax. Apply this mixture with a stiff brush, allow it to dry, and when it is heated, the mass fuses into a glaze or glass.

63. Another cement or plaster for a similar purpose is made by mixing 3 parts litharge, 2 parts freshly-burnt pulverised lime, and 1 part of white bole with linseed oil to a putty or paste.

64. Cement for fastening brass to glass: Boil 3 parts of rosin in 1 part of caustic soda and 5 parts of water, and mix the resulting resinate (a kind of soap) with half its weight of plaster of Paris.

65. Cement for fastening iron on glass: Soak white glue or gelatine for twelve hours in water, and then pour off the superfluous water, and mix in with the glue one-fourth part by bulk of treacle. Heat this gently until well incorporated. A little glycerine may be added to keep the compound from being too tenacious. Every time this compound is heated it softens by heat) it contracts, until at last it will no longer melt by heat.

(*To be concluded.*)

SCHOOLS IN THE STATES.

THE subject of ventilation of public schools is receiving attention in Baltimore. The health commissioner, Mr. Shane, reports to the City Council on the question, and urges them to promote legislation providing for the proper lighting, heating, and ventilation of schools. He recommends that not less than 15sq.ft. of floor space, and 2,000c.ft. of air per hour per pupil should be provided. The air should be delivered into the room near the ceiling, allowing it to diffuse at the top of room and then settle down. This air should be warmed sufficiently. The light should enter the room from the left of the pupil, and should never be less than one-seventh of the floor area. The hall space should be one sixth of the room space. The entrances should be ventilated, and all stairways made fireproof. It is also recommended that foot warmers should be placed in each hall so that the children may dry their feet in wet weather. The air of cloak-room should be heated and changed at least four times an hour. It is certainly quite time legislation should make it compulsory to provide air-space and proper ventilation in the schools of the States. In this respect our English schools are much in advance of those in the United States, where science has been spent in the erection of "tall buildings" and other mechanical feats, while hygiene has been neglected.

At a meeting held at Wakefield of the Walsham How Memorial Committee, it was reported that the amount promised towards the enlargement of the Cathedral was £3,840 3s., and towards the recumbent effigy £380 6s., a total of £4,220 9s. Mr. Frank L. Pearson is the architect to the committee.

The foundation-stone of the new Church of Our Lady of Perpetual Succour has been laid at Gillingham, near Beccles. The church, as designed by Mr. F. E. Banham, architect, will be built in the Roman style by Messrs. Allen, contractors, Beccles, and will consist of sanctuary, nave, and campanile, with sacristy, confessional, and lobby on the south side. Its dimensions are 77ft. by 22ft.; and will present a structure of red brick with stone dressings, and campanile of brick with stone cupola 60ft. high. In the interior there will be a circular apse and circular ceiling, and the walls will be divided into bays with pedestal columns and cornices of the Doric order.

Mr. Justice North, in the Chancery Division, on Saturday, heard a petition presented on behalf of the National Dwellings Society, Ltd., asking the sanction of the Court to the reduction of its capital, owing to the defalcations of its former managing director, A. T. Hawkins. The company was for some time under the control of Hawkins, who committed numerous frauds upon the company, misappropriated money, and wrote up fictitious values of the company's property. A committee of investigation was appointed, which discovered the frauds, and he was prosecuted. He was sentenced to five years' penal servitude. The present capital of the company was £150,000, divided into 30,000 shares of £5 each. It was proposed to write off £93,183 10s. as capital lost or unrepresented by available assets, thus reducing the capital of the company to £56,816 10s. His Lordship sanctioned the reduction.

OBITUARY.

Mr. James Edmeston, F.R.I.B.A., F.S.I., of 42, Old Broad-street, E.C., one of the oldest architects practising in the City, died on Friday last at his residence, 49, Inverness-terrace, Hyde Park, W. Mr. Edmeston, who was in his 75th year, succumbed to an attack of bronchitis. The son of Mr. James Edmeston, the author of many Evangelical hymns still well-known and often sung, Mr. Edmeston was the pupil and managing clerk to the late Arthur Ashpitel, but had spent the whole of a long professional career in the City, where he built up an extensive practice in designing banks, offices, warehouses, and other premises for commercial purposes. His wide experience, sound judgment, and business capacity made his services in later years widely in request in arbitrations, and also as assessor in architectural competitions. He was the official arbitrator to the City of London Court, and one of those appointed under the Board of Trade, while among recent competitions in which he acted as assessor may be named three at Richmond, Surrey—those for the municipal buildings, the isolation hospital and coroner's court, and one decided only a fortnight since, that for the workhouse infirmary at Dorking. He was for some years in partnership with his only son, Mr. James Stanning Edmeston, and upon that gentleman's death in September, 1884, he took into partnership Mr. Edward Gabriel, of Old Broad-street, E.C., and Bristol, by whom the practice will be continued. Among the later works carried out by Messrs. Edmeston and Gabriel may be named the completion of Olympia on the deaths successively of Mr. Peck and Mr. Coe; a large number of suburban banking premises for the London and South-Western Bank, and also their head-office, the most recently opened being that at Kilburn: the free library at Tottenham: the free library and fire-brigade station and isolation hospital at Willesden; extensive works for the Brush Electric Company at Loughborough, Leicestershire, now approaching completion; and many buildings at Bristol and its vicinity. Mr. Edmeston took a keen interest in the introduction of zinc as a practicable building material, and many years since read papers before the Institute on the methods of selecting, laying, and preserving the metal. He was one of the promoters, and until his death a director, of the Architectural Union Co., the owners of No. 9, Conduit-street, so long the home of the Royal Institute of British Architects and the Architectural Association, and was for many years its chairman, an office in which he was succeeded a year or two since by his old friend Mr. Arthur Cates. He joined the R.I.B.A. as an Associate in 1856, becoming a Fellow three years later, and subsequently served on the council, and was one of the oldest members, his place on the roll of membership this year being No. 36. He was one of the founders of the Architectural Association, and occupied the presidential chair so far back as 1853-4, having been a vice-president the previous year. He was also a Fellow of the Surveyors' Institution, and a member of the Surveyors' Association. He had been a member of the Bread-street Ward in the Common Council of the City since 1868, and was elected Deputy of that Ward in 1880. He took a hearty interest in the craft of Freemasonry, and was Past Grand Superintendent of Works, and, therefore, a member of Grand Lodge; also a member of Grand Chapter. He was for a long period the chairman of the Society for the Promotion of the Fine Arts, and on his resignation of that office some time since, owing to advancing years, was elected a vice-president. He was twice married, and leaves, by his first wife, three daughters; his second wife survives him. The funeral took place yesterday (Thursday) at noon at Brompton Cemetery, and was attended by the family, Mr. Gabriel and the members of the staff, and by representatives of the Royal Institute of British Architects and of the Corporation.

On Friday evening, Mr. G. P. Wyatt, coroner, opened an inquest at the Lambeth Coroner's Court on the body of Samuel John Long, aged 60 years, an architect, lately residing at 14, Mostyn-road, Brixton, whose death occurred under mysterious circumstances. Deceased left home at 10 a.m. on the previous Wednesday to collect some rents, and half an hour later a greengrocer passing the house heard a loud crash, and deceased was found in the footpath opposite his own door, obviously suffering from severe injuries. Death ensued within ten minutes. Medical evidence showed that the spinal column, sternum, one thigh, and all the ribs except two were broken, and there was also a compound fracture of one ankle. The doctor stated that the extent of damage could not have been greater had deceased fallen from the top of a spire or been run over by a traction engine. Nothing transpired as to how deceased met with his injuries, and it was thought impossible he could have returned unperceived to to the house to have thrown himself from the roof, a flat one, or a window. The inquest was adjourned.

CHIPS.

A new clock, in commemoration of Her Majesty's Diamond Jubilee, has just been fixed in the tower of Glentworth Church. The order was given to Messrs. W. Potts and Sons, of Leeds.

Several hundreds of the sufferers in the recent typhoid epidemic at Maidstone have decided at a private meeting to bring a combined action against the water company to obtain compensation for the losses which they have sustained. The company had expressed their willingness to make a grant of £3,000 as compensation, on conditions which the consumers could not accept.

At a vestry meeting held at Padstow, Cornwall, last week, plans were unanimously agreed to for reseating the fine old parish church, and a restoration committee was appointed. According to the *Royal Cornwall Gazette*, the plans were "prepared by Mr. Samuel Martyn, of Gragmeer, Mr. Prideaux-Brune's *head gardener* of the manor."

Damage to the extent of over £100 was caused by a fire which broke out on Friday night on the premises of S. and R. Horton, joiners, in Portland-street, Lincoln.

The Manchester Corporation granted at their last meeting the following advances of salary in the waterworks department:—Mr. William Blackstock, secretary, £400 to £450; Mr. Joseph Haynes, general inspector and surveyor of mains, £350 to £400; and Mr. L. Holme Lewis, engineer and manager of the hydraulic power supply, £350 to £400.

A light railway has now been authorised to be made from Helston to The Lizard. It will be 11¼ miles long, and there will be three fixed stations: at Dodson's Gap, two miles from Helston; at Trevassack, five miles from Helston; at Penhale, about 3½ miles from The Lizard, and near The Lizard Village, where the line will terminate.

It has been determined that from the 31st inst. the administration of the grants for drawing and manual instruction in public elementary day schools shall be transferred from the Department of Science and Art to the Education Department.

A syndicate of Airdrie gentlemen have secured from the Caledonian Railway Company a site of 12 acres between Calder and Whifflet stations whereon to erect extensive ironworks for the production of merchant bars, &c. Operations have been begun, and arrangements are being made so that the ironworks can be considerably extended, and a steel plant can be put down. Mr. David Home Morton, A.M.I.C.E., has been commissioned to design and put down the necessary works.

At the last meeting of the Liverpool Corporation, Mr. John Alexander Brodie, Whitworth Scholar, M.Inst.C.E., M.Inst.M.E., was appointed city engineer and surveyor to the urban sanitary authority in place of Mr. H. P. Boulnois, resigned, at a salary of £1,000 per annum, under the usual conditions. It was stated that there were 52 applicants for the position, ten of whom appeared before the committee, and the choice of Mr. Brodie was unanimous.

A new home for nurses engaged at the Bradford Workhouse and additional cottage homes for boarded-out children in the same institution were opened on Saturday. The home for nurses has cost £7,000, and that for children £1,500. The plans are the joint production of Mr. J. H. Martin, of Newcastle, and Mr. J. P. Kay, of Leeds, and the nurses' home is built on the pavilion plan, and has accommodation for 36 in the bedrooms.

The foundation-stone of church Sunday-schools for Stythians was laid on Monday week. The new building, which is close to the church, will contain main room, 48ft. by 24ft., and a classroom adjoining, 17ft. by 9ft. Local stone will be used, with granite dressings. The architect is Mr. W. Swift, of Truro, and the builders are Messrs. John Symons and Son, of Blackwater. The cost will be £550.

Good progress is being made with the extension of the steamboat pier at Walton-on-the-Naze. The extension reached its full length in an easterly direction on Friday—viz., 2,000ft. Now the works will proceed in a southerly direction for 500ft.

With a view to improving the water supply at Wallasey, the water committee of the council have decided to carry out boring operations at the Liscard works, at an estimated cost of £1,500.

PROFESSIONAL AND TRADE SOCIETIES.

Amalgamated Society of House-Decorators and Painters. — On Saturday, this society brought to a close their Bristol conference. Every weekday for a fortnight the general council of the organisation, numbering between forty and fifty delegates, met for the discussion of rules which form the constitution of the society. One of the most important proposals which received attention in the latter part of the conference was that to establish an out-of-work-benefit fund. The Worcester District had on the agenda a detailed set of proposals for a fixed scale of pay, and these were based on the assumption that 4d. per week extra contribution would enable 10s. per week to be paid to men not in work. The council, however, although not in the possession of figures sufficient to enable a scheme to be formulated, seemed convinced that such a rate of benefit could only be given by increasing this contribution to 6d. or 7d. at least. Several delegates opposed the idea of making such a scheme compulsory; but the council, by a majority of only one vote, affirmed the principle of such a scheme, and appointed a special committee to go into the whole question, and submit the result of their deliberations to the branches. Another matter of interest was a motion in favour of a superannuation fund. The allowance suggested was 5s. a week to a member 60 years of age who had been in the society for 15 years, and 7s. per week for a member of 20 years' standing. This, however, it was proposed to accompany with conditions calculated to reduce materially the liability such superannuation involved upon the society. The member superannuated was to lose all benefits other than funeral benefit, and it was pointed out that among members over sixty years of age sick pay was at present a serious item. Beyond this, members would not be superannuated if earning more than half the usual rate of wages, so that a painter retaining his health and strength had little temptation to throw himself on the superannuation fund. The superannuation scheme received a good deal of support, but not enough to carry it. A scheme was adopted which calls into being district management committees, to deal with wages, hours of labour, overtime, and the general conditions affecting the interests of the trade in the respective districts, and to bring about the amicable settlement of disputes with employers where possible. A resolution in favour of separating the trade and sick benefit funds was defeated. It was decided that in future the strike pay will be 2s. 6d. per day, instead of 1s. 8d. as heretofore. Messrs. Gaiger, Bennett, Duokin, Matthews, and Owen were appointed a committee to draft a scheme of out-of-work benefit, and Messrs. Dunkin and Bennett were appointed to act with the general secretary in the tabulation of the rules. Birmingham, London, Cardiff, and Leicester were nominated for the next general council meeting, and Birmingham was selected.

Birmingham Architectural Association.—A meeting of the members of this association was held on Friday night at Queen's College, Paradise-street, when an address was delivered by Professor Aitchison, R.A., P.R.I.B.A. The President (Mr. C. E. Bateman) presided, and there was a good attendance. Professor Aitchison said the first thing anyone who desired to become an architect should be sure of was that he had a natural gift for the work, and if he found that he had no taste for it, and that he had been mistaken in the passion, he should get his living in something else. The profession of an architect was by no means a money-making profession, and if a person found he could not devote himself with all the energy he possessed to the study of architecture he might surely do something better than spoil the look of the face of his own country. Architecture was pre-eminently a constructional art, and consequently it was of the utmost importance that any man who wanted to become an architect should make himself sufficiently acquainted with the subject, so that he could build with satisfaction to himself and to those who used the edifice. The science of construction was statics, and every man who professed to be an architect should learn sufficiently of statics to be able to gauge the security of walls against the pressure of the wind, water, and earth, and even against the pressure of goods stowed against them that had an inclination to slide. He must know the pressure that was exercised by vaults, domes, and arches, and learn how those might be properly abutted, as well as understand how to prevent walls, piers, and columns becoming forced out of the vertical. Besides statics, he had to learn the force and strength of the different materials that were used. Unless a man knew the outlines of construction, he could hardly be called an architect, although he might be an admirable designer and planner. The great thing a man who could plan and construct ought to know was how to make the necessary portions of the building he was putting up tell the tale they were required to tell. He was sorry to say that a great deal too little attention was paid to that matter in England, for they saw all kinds of incongruous ornaments and decorations put on all sorts of places. It was probably ten times more difficult to get a thing to look well that was simple than if it was ornamented. Great ornateness was a mistake, for it was never equal to the perfection that could be obtained by the greatest possible simplicity. In every architectural epoch of importance the world had known some buildings were erected that had been the admiration of succeeding generations, and now all persons of culture and wealth would as soon think of being ignorant of the great writers of their own countries as not to have seen Rome, Athens, Italy, and Florence. He did not know we were very much inferior in Gothic days in our works to the French; but he was afraid in his time there had not been so many great buildings put up that would bring persons to see them from all parts of the world. One of the things that seemed to be forgotten was that architecture was a constructive art, and sufficient pains were not taken to see how the elegancies of proportion and the beauties of form could be added to our buildings. Those who felt they had divine genius for architecture should use that precious gift properly, and let no labour and no difficulty overcome their desire to make themselves skilful, and to confer such an inestimable boon on their country as to be able to raise buildings which would attract people from all parts of the world.—On the motion of Mr. W. Hale, seconded by Mr. W. Henman, a vote of thanks was accorded Professor Aitchison for his address.

Exeter Diocesan Architectural and Archæological Society. — Bishop Kestell-Cornish, formerly Bishop of Madagascar, presided at a meeting of this Society on Friday, when a paper was read by Canon Edmonds on the length of the Norman nave of Exeter Cathedral. The lecturer said Dr. Oliver, who had left them much valuable information, was of opinion that the original Norman part of the cathedral stopped at the north porch, and that Grandisson added further pillars westward. There were proofs of Norman work in the nave. A document of 1283 showed that Grandisson built the chapel of St. Ragisund in the north side of the big west door, and in order to do so had knocked down the original Norman wall. From the various proofs they had, Canon Edmonds contended that the present nave of the cathedral was precisely the length of the original Norman building. A discussion followed in which the speakers generally agreed that the opener's conclusion was correct.

Royal Institute of British Architects.—At a special general meeting of this Institute held on Monday evening, the chairman, Mr. W. M. Fawcett, M.A. (vice-president), moved that, subject to Her Majesty's gracious sanction, the Royal Gold Medal for the promotion of architecture be presented to Professor Aitchison, R.A. The motion having been seconded by Mr. H. L. Florence (vice-president), it was resolved *nem. con.* "That, subject to Her Majesty's gracious sanction, the Royal Gold Medal for the promotion of architecture be presented this year to Professor Aitchison, R.A." A business meeting was held immediately afterwards, Mr. W. M. Fawcett, M.A. (vice-president), in the chair. The chairman announced that the Council had resolved to increase the value of the Owen Jones Studentship from £50 to £100, and that the holder of the studentship would be required to make a tour extending over six months, such tour to be devoted to the improvement and cultivation of his knowledge of the successful application of colour as a means of architectural expression.

Sheffield Society of Architects and Surveyors.—The monthly meeting of members of this society was held on Tuesday evening. A lecture was delivered by Mr. Charles Castle, of Sheffield, one of the members, on "Timber for Construction and Decoration." He outlined some of the many vicissitudes through which timber trees pass from birth to maturity, and explained how environment almost changed the species. Mr. Castle rapidly passed in review some of the ordinary woods of commerce, such as spruce, pitch pine, yellow pine, red pine, &c. Then teak, Kauri, Oregon pine, mahogany, oak and canary wood, pointing out their various characteristics, and showing in detail many interesting facts in relation to them. Some good specimens of the combination of various woods for decorative purposes were then shown. The lecturer said that teak was one of the most reliable and beautiful of woods. It had the advantage of standing artificial drying without casting, and it was most durable. Kauri was a wood also much praised for its beauty by Mr. Castle, who said that its natural colour was like plain satinwood, and used in decoration it would alternate with any darker wood. It was strongly recommended for first-class floorings, staircases, hand-rails, and shop-fronts. The various kinds of mahogany were referred to, and samples shown. The immense increase in the importation of African mahogany was noted. The amount of 200 tons in 1886 had increased to the enormous extent of 40,000 tons in 1897.

Society of Engineers.—At a meeting of this society, held at the Royal United Service Institution, Whitehall, on Monday evening, Mr. W. Worby Beaumont, president, in the chair, a paper was read by Mr. William Fox, M.Inst.C.E., entitled "Reservoir Embankments: with Suggestions for Avoiding and Remedying Failures." The author mentioned several instances where difficulties had arisen, and the means adopted to overcome them. He then described the depth and form of the foundation for the puddle trench, showing how springs might be dealt with by means of vertical pipes. He referred to the width of the trench when to be refilled with concrete or puddle, and gave the proportions in both lime and cement concrete. The author gave his experience with reference to the material used and mode of construction of the embankment; particulars of the width of the puddle wall; the distribution of material on each side, and width of the top; the desirability of the construction of stone or burned ballast toes under certain conditions; the mode of working the clay and of forming the layers of embankment, and the protection of the inner slope from the wash of the waves. In connection with the Den of Ogil Reservoir at Forfar, the author described the way in which a leak through the concrete was traced and repaired. The Dowdeswell Reservoir Embankment, which was made to a great extent of clay, was provided with burned ballast toes to within 20ft. of top bank level, which had the desired effect of preventing any slipping. The Monkswood Reservoir was also made of very treacherous material, and to prevent slipping, rubble stone toes were adopted. This had the desired effect to a certain extent, but it was found necessary to use more rubble stone than originally intended, and to flatten the outside slope. These precautions were taken immediately signs of a slip became visible, and successfully prevented any further movement.

The vicar of St. Crantock, near Newquay, has issued an appeal for help in restoring the fine old church in his parish. He states that the building has been ruinous these many years, and unless something is soon done it may suffer disastrously. The estimated cost of restoration is £2,000, towards which about £750 is available.

The Edinburgh Architectural Society met on the 2nd inst., the president, Mr. W. Nicholson Cumming, in the chair, when Mr. A. Hunter Crawford delivered a lecture on "Steam-Heating." The lecturer adopted the plan of discussing the solution of an actual problem before his audience, illustrating the subject by sketches and a working model, showing a combined method of steam-heating and domestic hot-water supply.

Mr. G. Salviati, the well-known dealer in Venetian glass, of 213, Regent-street, shot himself on Friday night in his shop after the last of the employés had left. Upon the premises being entered the following morning, he was found lying dead with a bullet-wound in his forehead. A few weeks ago Mr. Salviati turned his business into a limited liability company. The evidence given at the inquest showed that deceased, who was 55 years of age, had recently suffered from insomnia, and although a wealthy man, was under the delusion that he was beset with pecuniary difficulties. A verdict of suicide during temporary insanity was returned by the jury.

Building Intelligence.

Derby.—Holy Trinity Parish Church, situated in the London-road, and opposite the Royal Derbyshire Infirmary, was recently condemned as unsafe by the professional adviser of the vicar and churchwardens, Mr. Charles E. Hewitt, architect, of Queen's-road, Brighton, who has been consulted from time to time during the last three or four years. A survey made in November, 1897, showed that there had been a further subsidence of the building, and that, in addition to the tower being very weak and about 9in. out of the perpendicular, the body of the church was in such a dangerous condition, owing to the roof, that it was necessary to prevent what might have become a general collapse of the whole structure. A specification and plan were prepared and a faculty obtained, and the work, which was intrusted to Mr. R. Weston, builder, of Derby, under the superintendence of the architect, was completed at the end of last month. The work undertaken included (*a*) taking down about 34ft. of the tower; (*b*) securing the roof trusses (the span of the roof being 45ft.) to prevent them becoming further out of the perpendicular; (*c*) the main walls of the body of the church, on which the roof trusses rest, have been tied together with steel tie-rods to prevent spreading; (*d*) the west walls of the nave have been shored, and also the windows over which the roof trusses rest. These measures, adopted for the safety of the public and the congregation, are only of a temporary nature, as the vicar and churchwardens are contemplating the erection of a new church on the same site. This church was struck by lightning in June, 1853.

Liverpool.—The city surveyor of Liverpool, Mr. George Shelmerdine, reported on Friday to the finance committee of the corporation of that city as to utilising the site of St. George's Church, which occupies the site of the ancient castle, and which is about to be demolished. He said there were 115 vaults underneath the body of the church. The majority of the pits had wooden lid coverings, which in many instances had fallen in, and no earth covered them. The vaults being in a confined space, the atmosphere was necessarily putrid, and was certainly dangerous to the health of persons entering them. The surveyor said he attributed his recent illness to his inspection. The remains ought to be removed and reinterred. The trustees' surveyor (Mr. Bradbury) had stated that it was the intention of the trustees to take down and dispose of everything to the floor-level of the church, leaving the lofty spire and arches of the vaults and the foundation for the corporation to remove. Mr. Shelmerdine reported that the cost of removing these would far outweigh the value of the materials. The site comprises an area of about 1,090 square yards, and, with the cabstand on the south side, there was at command a site unequalled in the centre of the city available for the erection of a building for public purposes, and one which would be found capable of fine architectural treatment. He had prepared a draft of a plan for a proposed council-house on the site, containing lord mayor's, luncheon and tea, committee, and retiring rooms, &c. Consideration of the report was postponed.

Milton, Portsea.—The new workhouse infirmary and nurses' home at Milton have been formally opened. The infirmary buildings run north and south, and comprise two ward pavilions, nurses' home, and kitchen block. The ward pavilions afford accommodation for 60 male and 60 female patients, and contain on each floor a ward 76ft. by 24ft., two isolation wards, nurses' duty room, linen store, bath-room, lavatories, small lift, &c. The ground floor is kept up 3ft. above ground line. The upper floors throughout are of fireproof construction. At the south end of each of the large wards there is a balcony, with external staircases affording a second exit in case of fire or panic. The nurses' home is a three-story building, facing south, and contains matron's apartments, nurses' dining and drawing rooms, linen stores, &c., and 21 bedrooms. The kitchen is fitted with plant and appliances to cook for the whole of the patients, both in the old and new hospital blocks, and also in the imbecile wards, and is centrally situate. In the basement are two 10H.P. steam boilers. The buildings throughout are lighted by electricity. The cost of the works, including road-making, has been approximately £22,000, and of the furnishing £2,000. Mr. A. H. Barnes has acted as clerk of works, and the works have been carried out from the designs of Mr. C. W. Bevis, F.R.I.B.A., architect, of Southsea.

Peterborough.—At the last meeting of the committee for the restoration of Peterborough Cathedral, held on Thursday in last week, Mr. G. F. Bodley, A.R.A., the newly-appointed architect, was present, and reported on his recent inspection of the west front and other parts of the cathedral which are showing signs of weakness. He stated that the measures already taken confirmed the wisdom of the course suggested and carried out on the north side by his predecessor, the late Mr. J. L. Pearson, R.A. Happily, the great arch on the south side of west front was not in so bad a state as the northern one, and he hoped they might be able to keep it up. Mr. Bodley thought that by carefully grouting with liquid grout from the top of the arch, and other means, much might be done to strengthen it; but it had yet to be seen how far this would be sufficient. The whole of the front had gone considerably out of the vertical, and was a good deal shaken, and the gable end was so weak that he feared it must be reset. The walling behind the ashlar face was in so bad a state that he thought no method of strengthening the wall was here practically possible, though he lamented the necessity of its being taken down. The stone was so perished and the masonry so shaken that it would not be feasible to back the existing wall of the gable and get sufficient strength for it. This work should be taken in hand at once. Mr. Bodley also drew attention to urgent repairs needed in the walls of the eastern chapel. The estimated cost of the whole of the work was £8,659, and that which it was urgent to undertake at once would cost £2,739. It was decided, on the proposal of the Marquis of Exeter, to proceed with the more urgent work, and to hold a public meeting on behalf of the restoration fund at Peterborough on April 20.

St. Anne's-on-Sea.—The new clubhouse of the Lytham and St. Anne's Golf Club was formally opened on Saturday by the Marquis of Lorne. The links are situated between the railway stations of St. Anne's and Ansdell. The circuit of the links is 3¼ miles, and the area covers some 150 acres. The club has expended over £3,000 on the links alone, while the Gothic clubhouse, built from the designs of Messrs. Woolfall and Eccles, of Liverpool, has cost £8,000, and the furnishing an additional £2,000. The house comprises entrance-hall, locker-rooms, clubrooms, dining-hall, ladies' clubroom and dressing-rooms, billiard-room, baths, lavatories, offices, and steward's service.

Warrington.—The foundation-stones of the new workhouse infirmary were laid on Thursday in last week. The infirmary will stand upon five-and-three-quarter acres of land immediately behind the present workhouse premises. The present contracts deal with three blocks of buildings, standing 70ft. apart, but connected on each floor with open-air corridors, 10ft. wide. The central will be the administrative block, three stories high, and the two outer blocks will be ward pavilions, each two stories high. Under the whole of the buildings there will be a basement for access to heating and water-pipes. The administrative block will give accommodation on the ground floor for the medical officer, head nurse, dispensary, waiting-room, nurses' sitting and dining rooms, linen stores, and on the first and second floors there will be bedrooms for the nursing staff, each floor being fitted with baths, lavatories, and closets. The other two blocks will be ward pavilions, one for males and the other for females, each accommodating 92 beds, or a total of 184. In each block there are two wards of 24 beds, two wards of four beds, and six wards of three beds each, and each set of wards has separate baths, lavatories, and closets. There are also ward kitchens, linen rooms, separation lobbies, and lifts. All wards will be heated by open fireplaces, or central open-fire Musgrave stoves, augmented by hot-water pipes. The floors throughout will be fireproof, of Messrs. Heman and Rogers' construction, and in addition to stone staircases there will be also an outer stair of iron in each case. The contract entered into with Mr. C. W. Davenport, of Stockton Heath, including the boundary walls, amounts to £23,266. Externally, hard grey brick will be used, with a sparing allowance of terracotta and red pressed brick dressings. The works have been designed by Messrs. William and Segar Owen, architects, of Warrington.

Engineering Notes.

Aberlady and Gullane Railway.—The new railway connecting Aberlady and Gullane with the main line of the North British Railway will be opened for traffic on April 1. The line is only 4¼ miles in length, but it will open up an attractive district of East Lothian. The new line, which is single throughout, leaves the main line a mile and a half to the east of Longniddry junction. There is an intermediate station at Aberlady. The railway will be worked by the North British Railway Company, who are asking sanction this session to the extension of the stipulated time for the completion of the line from Gullane station to join the North Berwick loop line near Williamston Farm.

Manchester.—The Lancashire and Yorkshire Railway Company will open their new branch line to the Manchester Ship Canal for merchandise traffic on Monday, the 28th inst. The work has been in progress since November, 1895. The new line is for the most part carried underground, by means of a series of tunnels. On the whole length of the line there were buildings, chiefly shops and dwelling-houses, which had to be demolished. The tunnelling throughout is faced with blue Staffordshire bricks. The height of the tunnels is from 17ft. to 23ft., and the depth of the line below the surface varies from 35ft. to 45ft. Some of the walls are 7ft. and others as much as 12ft. thick. One difficult feature was the making of a tunnel between the London and North-Western Railway and Regent-road. The large gasholders and the mains leading from them along West Egerton-street had to be carefully passed. Then also a tunnel had to be made under the North-Western line, which itself passes under West Egerton-street by means of a bridge. Mr. W. B. Worthington is the chief engineer of the Company, and Mr. L. Franklin has acted as resident engineer. Mr. Thomas Wrigley, of Middleton Junction, was the contractor.

Peterhead.—The annual report of the engineers in chief for the new harbour of refuge, Messrs. Coode, Son, and Matthews, of 9, Victoria-street, S.W., states that during the past year the south breakwater was extended 105ft. A further length of 45ft. has been brought up to low-water level. Mr. E. Raban, director of works, in a memorandum on the report, says progress continues to be made with the south breakwater and barge harbour. The quarry has been further opened out, and the workyard, buildings, railway, and plant properly maintained. A new locomotive tank engine has been supplied. The daily average number of convicts employed on the works during the year has been 237, as against 241 shown in the previous year's report. The annual report of the surveyors, with measurements and valuation of the work done on the basis of Sir John Coode's original estimate, has been received. The result is given in the following extract from that report:—"As far as can be seen at present, the original estimates will not be exceeded. The works do not progress so rapidly as possibly they might, owing to the dearth of convicts. This is, no doubt, a satisfactory circumstance to notice. At the same time, the want of progress will tend to increase the total cost.

Port Victoria.—The South-Eastern Railway Company have completed the reconstruction of Port Victoria pier, the terminus of the Hundred of Hoo branch, which was temporarily closed for traffic in October, 1896, on account of the structure being considered unsafe to bear the strain of trains. The pier has been strengthened by the addition of 324 new piles, the largest of them being 70ft. long and 17in. square. The piles on the riverside of the pier have been left standing 6ft. above the deck level, in order to prevent the sponsons of Royal yachts from settling on the edge of the pier when lying alongside at high water. The whole of the old piles have been left in, the new piles being driven alongside of them and being bolted to them by 1¼in. bolts. To prevent the inroads of the teredos, which have eaten away the old piles, the new piles have been sheeted with copper for a height of 4ft. above mud level. The plan of the superstructure—platform and buildings—has been entirely altered, the rails being now laid on the inner side of the pier, facing the Isle of Grain. A covered way has been provided, and the length of the platform has been extended to 500ft. The works have been carried out by Messrs. John Aird and Sons, of Lambeth.

THE ROYAL MASONIC INSTITUTION FOR BOYS, BUSHEY.—STUDIES OF ANIMAL LIFE, TREATED FOR DESIGN.

Our Illustrations.

ROYAL MASONIC INSTITUTION FOR BOYS, BUSHEY.

It is intended to erect new schools at Bushey, Herts, as a memorial of the centenary of this institution, the requirements having outgrown the existing buildings at Wood Green. With the general approval of the subscribers, the board of management purchased the Bushey Grove Park Estate of about 67 acres in extent, and has devoted much labour to its development. The site is an admirable one, having an area of 65 acres, with roads on all sides, the general soil being loam with pebbles therein, and possesses a level plateau, standing high, upon which it is proposed to erect the buildings. Having given full consideration to the future requirements as well as the immediate necessities of the institution, with the valuable assistance of W. Bro. Rowland Plumbe, F.R.I.B.A., P.G. Supt. of Works, the board prepared a schedule of conditions and accommodation required, and invited six firms of architects to submit designs in a limited competition. The designs were most carefully adjudicated upon by the assessor, whose award met with the unanimous approval of the board, and the plans placed first in order of merit were submitted to the Quarterly Court in January last. The authors of the designs were found to be Messrs. Gordon, Lowther, and Gunton, of Finsbury House, London, E.C., and these brethren are now engaged in preparing the working drawings and quantities. It is expected to have these completed and the work on the buildings commenced in the autumn. The designs show a complete arrangement for a school of 500 boys; but it is proposed to build dormitory accommodation for 400 only at present. The administrative offices, halls, &c., will be adapted for the greater number, so as to avoid expense in alterations, &c., in the future. It will be seen from the accompanying plan that the general scheme is quadrangular, placed so as to secure the best possible aspects, the administrative block, with its central tower, occupying the principal or south-west side and facing the main road and entrance. This block contains the museum and library. The Educational block, with its separate quadrangle, containing the assembly-hall, the music-school, the various arts and physics schools, classrooms, together with the chapel and head-master's residence adjoining, are placed on the north-west side. The north-east side is occupied by the dining-hall, the kitchen and service department, with its separate courtyard; and beyond this the technical schools, swimming-bath, gymnasium, and fives-courts, &c., are placed. The south-east side is left partially open for the present, with a view to the erection in the future, if necessary, of an additional residential block. The residential blocks are placed at each corner of the main quadrangle, and arranged to accommodate 100 boys, each block comprising two houses with day-schools, dormitories, and masters' and service-rooms, complete. A main feature of the design is that all the principal blocks are connected by cloisters and subways, and are provided for domestic service. It is proposed ultimately to erect a sanatorium for 50 boys, as well as an infirmary for 25 cases, the former at the extreme north corner of the site, so as to be placed as far as possible from the school building, and the latter at the extreme south, each having separate approaches from the main roads. The playing-fields and tennis-courts are placed to the south and west of the site, and the former are overlooked from the master's residence. The heating to the buildings will be by means of hot water on the low-pressure system, with ventilating radiators for the admission of warm, fresh air, in conjunction with Tobin's tubes, the exhaust ventilation being effected by means of fans placed in the turrets, and connected with horizontal trunks in the floors and ceilings, and rising flues in the walls, fitted with automatic valves. The lighting will be by means of electricity, which will be generated on the premises. The drainage will be on the duplicate system, well intercepted and ventilated, and arranged so as not, in any case, to pass under the residential portion of the buildings. The buildings are designed in a plain, scholastic style, mainly 15th-century in character, having red brick facings, stone dressings, and slated roofs of a green tint. Great reliance has been placed upon the grouping of the various blocks for the general effect, the main entrance being distinguished by a central clock-tower, and the residential blocks at each corner of the main quadrangle by square towers containing the water-storage tanks. A further and important feature of the principal front will be the chapel, which will be erected at the cost and under the immediate supervision of W. Bro. Charles E. Keyser, patron and treasurer of the institution. This munificent example, the board hopes, may be followed by others, and thus economise the very limited capital funds of the institution. An opportunity is also afforded to lodges, chapters, or brethren to undertake certain structural embellishments, which will add grace and dignity to buildings of intense usefulness, and of which there is every reason to believe the whole Craft will be proud.

STUDIES OF ANIMAL LIFE TREATED FOR DESIGN: NATIONAL SILVER MEDAL DRAWINGS, BY JOHN BROWNSWORD.

Continuing the series of bird and quadruped studies which we commenced on Jan. 7 last, we give to-day a sheet of very spirited drawings of a suggestive character from the brush of Mr. John Brownsword, of the Royal College of Art. The aim of the artist has been to present the subjects in a strictly natural way as records which shall be ornithologically and zoologically correct, but at the same time so contrived as to offer ideas for adaptation and development in a conventional manner for decorative design. This intention seems to have been very well managed, and for this purpose these sketches cannot fail to be valued by our readers.

Mr. T. B. Grierson, chief engineer of the Dublin, Wicklow, and Wexford Railway, has been appointed engineer and locomotive superintendent of the Lancashire, Derbyshire, and East Coast Railway.

The formal reopening of the grand organ in St. George's Hall, Liverpool, after being closed for improvements and rearrangements for about five months, took place on Saturday. The alterations have been carried out by Mr. Henry Willis, of London, at a cost of upwards of £3,000.

The newly-erected diphtheria block, which has been added to the Delancey Fever Hospital at Cheltenham, was opened on Saturday afternoon. The new block, which is isolated from the main building, consists of three wards for two beds each, a convalescent ward, nurses' room, bath-room, stores, &c., arranged round a corridor 6ft. wide. Messrs. Middleton, Prothero, and Phillott, of Cheltenham, were the architects, and Messrs. Collins and Godfrey, of Tewkesbury, the contractors. The total outlay will reach £2,500.

Messrs. Galbraith and Church, the engineers of the extension from Wadebridge to Padstow of the North Cornwall Railway, report that great progress is being made with the undertaking. Some three-fifths of the total excavation is done, and nearly 3¼ miles of the line formed. The masonry and bridges are well forward, and a considerable number of the cast-iron cylinders for the viaduct piers are on the ground. The station-house at Padstow is about half-built, and platform walls are in hand.

COMPETITIONS.

Armley.—In a limited competition for chapel and Sunday-schools for the Methodist Free Church, Armley, near Leeds, the design submitted by Mr. Walter Hanstock, of Leeds and Batley, has been placed first, and its author will design and carry out the buildings.

Birmingham.—The plans prepared by the six selected local architects in competition for the new lunatic asylum which the Birmingham Corporation propose to erect at Holly Moor, near Rubery, have been deposited at the Council House in that city. The names of the competitors are: Messrs. Cossins, Peacock, and Bewlay, Colmore-row; Messrs. Mansell and Sons, Colmore-row; Messrs. Ingall and Sons, Temple-row West; Messrs. Cross, Brooks, and Nicholls, Temple-row; Mr. Frank B. Osborne, Bennett's-hill; and Messrs. Martin and Chamberlain, Colmore-row. Mr. G. T. Hine, F.R.I.B.A., of Parliament-street, S.W., has been appointed as assessor to the asylums committee.

Leicester.—In the competition by local architects for laying out the new cemetery on the Gilcross estate, the corporation have adopted the report of their assessor, Mr. John Belcher, F.R.I.B.A., of Hanover-square, W., and have awarded the first premium of £50 to Messrs. Goddard and Paget, the second, £30, to Mr. Stockdale Harrison, and the third of £20 to Mr. Chas. Kempson. The original estimate of Messrs. Goddard and Paget was £27,573; but the premiated plans have been revised and reduced in cost to £20,797, and with these modifications will be carried out.

Westminster.—The Poster competition in connection with the forthcoming Art Metal-Work Exhibition, to be held at the Royal Aquarium in May and June, was settled last Friday. Forty-three designs were received, and the prize was unanimously accorded to the design submitted by Mr. W. Dundas, Carlyle Studios, King's-road, Chelsea. The composition represents the Jack of Clubs holding a *repoussé* bowl, the figure being strikingly designed, and standing in front of a wrought-iron grille enriched with trefoils. Two other designs, which, as drawings, were in many ways superior, but less successful as posters to be seen at a distance and in the street, were awarded hon. mention. We shall probably illustrate them, with the chosen design, as all three are of exceptional interest. The judges who made the award were Messrs. George Frampton, A.R.A., Lewis F. Day, Maurice B. Adams, F.R.I.B.A., George Haité, Josiah Ritchie, managing director of the Aquarium Company; and Professor Banister Fletcher, J.P., chairman of the council of the Art Metal-Work Exhibition. During the week the Duke of Westminster has joined this council.

CHIPS.

Mr. George Gammon Adams, F.S.A., the well-known sculptor and medallist, died on Friday last at his residence, Acton Green Lodge, Chiswick, aged 77 years.

A theatre is being built at the corner of South-place, Kennington Park-road. Built in the Italian Renaissance style of white Portland stone, it will have an entrance frontage of 160ft.; there will be a marble staircase 29ft. wide leading to a crush-room, the roof of which will be supported by marble columns. There will be seating accommodation for 2,500 persons.

The Ben Brierley Memorial, which is to be placed in Queen's Park, Harpurhey, Manchester, will be completed and ready for unveiling about the middle of April. The statue will be 7ft. 3in. in height, and the pedestal and base 9ft., a total of 16ft. 3in. It is to be of whitbed Portland stone. The sculptor is Mr. John Cassidy, of Manchester.

The city council of Oxford have purchased land in Blue Boar-street in that city, and are about to erect thereon a residence for the chief constable at an estimated cost of £1,250. The site is at the rear of the new municipal buildings, and will communicate with them.

The amount provided in the 1898-99 estimates for continuing the work of mosaic decoration in the central hall at Westminster is £1,000. The next panel to be dealt with is that over the entrance to the House of Commons corridor, for which Sir Edward Poynter has drawn a cartoon of St. David in harmony with the representation of St. George opposite. The subjects for the other vacant panels will be St. Andrew and St. Patrick, for which the sketches prepared by Mr. Albert Moore, and exhibited for a considerable period at South Kensington, will probably be utilised.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Architect. (We know of no good book; but inquire of Batsford, 94, High Holborn, W.C.)

"BUILDING NEWS" DESIGNING CLUB.

Sixth List of Subjects.

F.—A Bungalow for a Gentleman.—The site for this small residence is on the side of a well-wooded hill a few miles from London, and the building is intended for summer occupation. The incline from east to west is 1ft. in 10ft., and the prospect, of course, is over the valley below. The approach is from the north. The base of the building is to be in red brick. The whole of the accommodation is to be on the ground floor, excepting a belvedere smoking-room, which is to be located over the central hall, out of which the reception and best bedrooms are to be approached. This hall is not to be treated as a sitting-room. The building must be compactly contrived in a simple and suitable way, remembering that a bungalow is not a baronial hall. The living-room is to be 24ft. long by about 18ft. wide. The drawing-room 16ft. by 13ft., or of that area. A billiard-room for a full-sized table. Four best bedrooms, and two more for female servants. A man's room is to be provided, and to be suitably isolated. A bathroom, lavatory and cloakroom, &c., and a box-room to be provided, and space for bicycles, golfing-irons, &c., is to be accommodated. There should be a small cellar, and the fall of the ground may suggest a half-basement; but the scheme is left to the competitors. Along the garden side of the house on the west front a terrace 12ft. wide is to be planned. The kitchen and offices to be appropriate for such a dwelling. Materials, brick and rough-cast. Tiled roofs. Scale, 8ft to the inch. Style, suitability. Plans, two elevations, section, and view. If really necessary to work the drawings nicely into one sheet, the scale of plans may be 16ft. to the inch.

Drawings Received.—"Stanley," "John Bull," "By Go," "Angler," "St. Catherine," "Chuckle," "Phantom," "Swan," "Saxon," "Suburb," "Gib."

Correspondence.

THE GOVERNMENT AND THE NEW PUBLIC OFFICES.

To the Editor of the Building News.

Sir,—The debate in the House of Commons last Friday shows that the Goverment and the House are taking a most laudable interest in the subject of the designs for the new public offices.

Mr. E. Morton asked, "How is the choice of designs made?" And Mr. Akers-Douglas replied that "The Government had not got so far as that yet."

I think, Sir, that it is generally understood that the Office of Works will lay down the *plans* of the new offices (as they are so well able to do), and that outside architects will be asked to clothe those plans with architecture worthy of the position. And it will be of very great interest to the profession at large to know, in good time, in what manner this outside help is to be invoked!

A rumour is afloat that the Office of Works will communicate with the Royal Institute of British Architects, with a view to appoint some one architect to so clothe the skeleton of the Office of Works; in other words, that it will be left to the council of the R.I.B.A. (because not a word of this arrangement will be communicated to the general body of members until the whole arrangement is cut and dried) to nominate and secure the appointment of the particular gentleman whom that council may delight to honour.

If this rumour has a foundation in fact, no time should be lost by the general body of architects in this country in conveying to the proper quarter (*i.e.*, the Government) the fact that such an arrangement will not be fair either to the public or to architects. Another opportunity (notwithstanding past failures) should be afforded for a *public competition* for these new offices, and in that way and that way alone will the final result be satisfactory. This will give a fair chance to the members of Council of the R.I.B.A. to show their superiority of knowledge of design as compared with the rest of the profession, and it may secure a design from some unknown man which may redeem the past, and give Whitehall a structure or structures in every way a credit to the architectural world.

At all events, Sir, it is now left for architects to assert their fair rights; but if they do not care to take the trouble to do that, then they have simply to await the announcement of the decision that Mr. A. B., member of Council of the R.I.B.A., has been selected by the Government to prepare designs for the new public offices to be erected in Whitehall. Personally, I have no other interest in the matter than to secure what I may term "fair play."—I am, &c.,

Wm. Woodward.

QUESTIONS.

[11911.]—**Bending Moment.**—I shall be obliged if someone will define the meaning of the term "bending moment," and also say whether a mechanical moment and a bending moment are synonymous terms?—Ignoramus.

[11912.]—**Painting Galvanised Iron.**—When galvanised iron is painted with paint made with white-lead, is a galvanic action set up and the durability of the iron thus lessened?—C. F. M.

[11913.]—**Furnishing Common Lodging-Houses.**—Can any of your numerous readers give me particulars and cost of furnishing the wards or cubicles for married couples and single men and women respectively?—Inquirer.

The annual dinner of the Birmingham Clerks of Works' and Builders' Foremen's Association was held at the White Horse Hotel, Congreve-street, in that city, on Tuesday week. County Alderman John Bowen, in responding to the toast of "The Honorary Members," congratulated the association upon its success, and which must be of great service to the building trade of Birmingham, and deserved the support of the Master Builders' Association. Mr. Whitall, vice-president, endorsed the views of Mr. Bowen. Mr. Cummings proposed the "Health of the Officers," and Mr. Patchett, the president of the association, responded.

The supply of property at the Tokenhouse-yard Mart during last week was of a limited character, and chiefly consisted of London and suburban brick and mortar investments. In some instances the demand for these properties was brisk, and in a few cases very exceptional prices were obtained. For reversions and life policies there was a good market, over £40,000 being realised for these speculative investments. The aggregate for the week amounted to £91,825, as compared with £65,142 for the same week in last year. During the month of February, although the supply has not been heavy, property has sold well, the total amount of the sales being £412,308, as compared with £318,909 for the corresponding month in 1897.

WATER SUPPLY AND SANITARY MATTERS.

Liverpool.—The conversion of Cowny Valley into a lake for the supply of water to Liverpool formed part of the original Vyrnwy scheme, and progress is now being made with this undertaking. With a view to the creation of this second watershed, a tunnel to Lake Vyrnwy is in course of construction, and the completion of this work will assure Liverpool of a generous water supply for many years to come. It is proposed to extend the accommodation of the Vyrnwy Hotel, which is thronged with visitors during the short summer season.

Moffat, N.B.—A special meeting of Moffat Burgh Commissioners was held last week to decide upon one of three systems of sewage purification as reported on by Mr. T. O. Niven, C.E., Glasgow. It was resolved to adopt the system known as Mr. Dibdin's, or the Sutton system, by which the sewage receives biological treatment, being purified by bacteria before being discharged into the river. At Moffat, owing to the substratum of land being porous, the tanks will require to be built of brick instead of being cut out of clay where this is available. It is proposed to provide an installation capable of dealing with 200,000 gallons in twenty-four hours, which will necessitate an area of about 670 square yards for tank and filter accommodation. The total estimated cost of the system is £2,350.

CHIPS.

An organ built by Messrs. Hele and Co., of London and Plymouth, was opened on the 3rd inst., at the Presbyterian Church, Augustine-parade, Bristol.

Through the courtesy of the architects (Messrs. Gibson and Russell, London), the members of the Leeds and Yorkshire Architectural Society and of the York Architectural Society were recently enabled to pay a joint visit of inspection to the county buildings which have been erected for the West Riding County Council at Wakefield. The party were met on their arrival by Mr. A. E. Marsh (clerk of works), who escorted them over the premises.

The Mersey Docks and Harbour Board have unanimously agreed, on the recommendation of the committee of works, to proceed with the extension of the Watlasey landing-stage at an estimated cost of £24,500. The stage will be extended 250ft. at its northern end.

The Anglesey County Council have decided almost unanimously to sanction a scheme for the construction of a light railway—probably in a form of an electric tramway—between Llanfair P.G. and Beaumaris.

Experiments have been made, the *Peterborough Advertiser* says, with brick-earth on the works of the New Peterborough Brick Company with the object of ascertaining the possibility of making white facing bricks of fine quality. The experiments have proved successful, and a first-class smooth-faced white brick is obtained from it. There is a likelihood of this description of brick becoming one of the most expensive turned out at the local yards, and there is every probability of a large demand being made for it.

The rebuilding of the barracks at Winchester on the new plan and site will be commenced soon after the tenders have been opened at the commencement of next month. The foundations will swallow up a lot of Wren's buildings, which are to be converted with concrete.

The Southampton board of guardians at their last meeting appointed Mr. Gutteridge, of that town, architect for the proposed new workhouse buildings on the Shirley Warren site.

A new organ erected in the Congregational chapel, Heywood-road, Castleton, Lancs, was opened last (Thursday) night. The organ, which is composed of three manuals, with 26 stops, and necessary couplers, has been built by Messrs. Driver and Co., of Burnley.

A three-light window in the south transept of Claydon parish church, near Ipswich, has just been filled with stained glass as a memorial. Mr. A. J. Moore, of Southampton-row, Russell-square, W.C., was the artist, and the subjects are the Annunciation, the Nativity, and the Presentation in the Temple.

A local Government inquiry was held at Newport, Mon., on Friday, into the application by the borough council to borrow £5,000 for the purpose of laying down wood-paving in High-street and Commercial-street. There was no opposition to the loan.

On Thursday in last week at the Camden Hotel, Pembury, Mr. G. W. Willcocks, M.Inst.C.E., held an inquiry on behalf of the Local Government Board, into an application by the Tonbridge Rural Sanitary Authority for a provisional order to compulsorily acquire lands required for the purposes of a sewerage scheme for the parish of Pembury.

LEGAL INTELLIGENCE.

Riotous Assertion of Rights of Ways.—In the Queen's Bench Division of the High Court, on Saturday, before the Lord Chief Justice, Mr. Justice Grantham, Mr. Justice Wright, Mr. Justice Bigham, and Mr. Justice Darling, sitting as a Court for the Considera ion of Crown Cases Reserved, an appeal was heard against a conviction of Henry Clemens and 19 others for having, on August 31 last, maliciously damaged a wooden structure, the property of the Headland Hotel Company, at Newquay, Cornwall. The hotel company had obtained a lease of land from the owner at Newquay, and begun excavations for the erection of a hotel, from plans by Mr. Silvanus Trevail, F.R.I.B A., of Truro, and had put up a wooden building as an office. The defeudants and other persons, claiming rights of net-drying and resort for recreation on the land, pulled down this building, and threw the materials of it into the sea. They were brought up for trial at the Bodmin Quarter Sessions, when their defence was that the acts alleged against them had been done in good faith, in assertion of rights which they believed to be possessed by the inhabitants of Newquay. The jury returned a general verdict of guilty, and also found that the defendants acted on the *bonâ-fide* belief that they were entitled to remove the building, and that they did more damage than was necessary. A fine of 40s. was imposed on each defendant, and a case was reserved for the consideration of the Court. Their Lordships upheld the conviction.

Commission on a Building Lease —Martin and Purchase v. Rafferty.—This, an action heard by Mr. Justice Wright on Saturday, was brought by Mr. George Dennis Martin and Mr. Edward Keynes Purchase, architects and surveyors, formerly carrying on business in partnership, against Mr. William John Rafferty, to recover £700 under an agreement dated March 11, 1895. Defendant denied liability. In March, 1895, the defendant was the owner in fee simple of some land at Bayswater which he was desirous of letting on a building lease at a ground rent, or selling. By an agreement dated March 11, the defendant agreed to pay the plaintiff a certain commission if he let the land on a building lease at a ground rent. There was also a clause in the agreement to the effect that if the defendant should let the land to a tenant not introduced by the plaintiffs, at a ground rent not exceeding £600 a year, he would pay them £350 in full settlement, and that if the ground rent exceeded that sum, the plaintiffs should receive one-half of the excess, calculated at 14 years' purchase. Plaintiffs' case was that they used their best efforts to let the land, and that while they were in negotiations with certain persons who were likely to take the site on a building lease, the defendant let the land to a Mr. Schofield, who was not introduced by them, at a ground rent of £675 per annum. Therefore they said they were entitled to recover £700. Defendant denied that the plaintiffs used their best endeavours to let the land, and contended that, under the agreement, he was relieved from liability, inasmuch as he had to abandon the letting of the land and to commence building thereon. Mr. Justice Wright said, in his opinion, the defendant never did abandon the intention of letting the site, though he took steps to begin building operations in order to save the County Council license. There would be judgment for the plaintiff for the amount claimed, with costs.

Dispute as to Bricks.—At the West Bromwich County-court on Friday, before Judge Griffith, an action was brought by Messrs. P. and S. Wood, brick manufacturers, Greets Green, against Messrs. Monk and Newell, contractors, of Heckmondwike, near Leeds, to recover £16 8s for the supply of bricks. The plaintiffs' case was that in April, 1896, the defendants obtained a contract for the erection of works at Heckmondwike belonging to the London and North-Western Railway Company. Plaintiffs' tender for bricks was accepted, and 100,000 were forwarded, but 20,000 were rejected. The defence was that the bricks rejected were of an inferior quality to those the plaintiffs quoted for. A counter-claim for £20 was put in by the defendants, on the ground that the bricks were not equal to the standard stipulated in the contract. The Judge gave a verdict for the plaintiffs on the claim, and also in respect of the counter-claim, but granted the defendants leave to appeal.

Curious Breach of Contract Case.—Haslett v. The North Sunderland Railway Company.—In this action, heard on Wednesday in the Queen's Bench Division by Mr. Justice Mathew, the plaintiff, Mr. Alfred Haslett, a contractor, claimed from the defendant company a sum of £2,611 5s. 6d. for work and labour done and materials supplied, and also damages for breach of contract. The claim arose out of the construction of a railway for the defendant company. On May 4, 1896, the plaintiff entered into a contract with the defendants to construct a railway for them from Sunderland to Seahouses, a distance of four miles, for £24,500. The contract was not actually executed, but it was adopted by the board of directors of the defendant company, and the plaintiff was authorised to commence the work. On May 14 the first sod was cut, and the plaintiff began erecting machinery and bringing materials for the purpose. It was a term of the contract that the plaintiff should on its execution deposit with the defendants a sum of £1,000 as security for its due performance, and this amount was to be repaid by instalments as the line progressed. It was also a term of the contract that the defendants were to pay the plaintiff £500 seven days after the commencement of the work, and another £500 14 days after that event. It so happened that the plaintiff, contrary to his expectations, had been unable to raise the £1,000 to deposit with the defendants, and so the contract was never executed. The work, however, was carried on by the plaintiff right up to September, 1896, when the defendants gave him notice to leave off, and terminated the contract on the ground that, as he had not paid the sum of £1,000, they were entitled to withdraw from the agreement. The defendants had not paid either of the two sums of £500 agreed on, nor anything except £200 on account, for work and labour done, which the plaintiff estimated at over £1,500. The plaintiff's case was that, though the contract had not been executed, since the directors had adopted it and had authorised the plaintiff to begin the work, the defendant company must be held to be bound by the contract. For the defendants it was said that they were quite willing to pay on a *quantum meruit* for work actually done by the plaintiff. The defendants, however, were not liable for breach of contract. The authority of the directors to commence the work was given subject to the payment of the deposit, and that was a condition precedent to the contract. Mr. Justice Mathew held that the condition that the plaintiff should pay £1,000 deposit was a condition precedent, and was vital to the contract, and therefore the plaintiff could not recover damages for breach of it. The plaintiff would be entitled to payment for what work he had done. Terms being agreed on, judgment was entered for the plaintiff for £1,500, less £200 already paid to him, and £200 brought by the defendants into court.

Contract not under Seal: a Legal Injustice.—At the Grantham County Court last month, before Judge Wightman Wood, an action was brought by Messrs. Foley Bros., contractors, Bourne, against the Bourne Rural District Council, to recover £46 for work done and materials supplied in connection with a contract for the sinking of an artesian well. The case was heard by a jury, who found in favour of the plaintiffs for £37 10s. A technical point was raised for the defence, that as the contract was not under seal the plaintiffs had no claim, and on this point his Honour reserved judgment. On Tuesday Judge Wood said he had looked up authorities on the subject, and the result was that, as the contract was not under seal, it did not bind the council, and plaintiffs could not recover the value of the work, notwithstanding the verdict of the jury. He added that he knew of no instance in which there was so strong a conflict between the law of the land and the common-sense of those who live under it. In the present case the defence must prevail, and his Honour gave judgment of non-suit, but without costs.

CHIPS.

The promoters of a pier company at Colwyn Bay seek to construct a pier, jetty, and landing-place, 1,000 yards in length, close to the L. and N.W. Railway subway. The estimated cost of the works is set down at £40,000.

Colonel Hepper, Local Government Board inspector, sat at Skipton on Tuesday to inquire into an application by the urban district council to borrow £1,200 for their Broughton-road sewerage scheme, and with respect to a further application to borrow £400 for a new steam fire-engine and appliances. There was no opposition.

In the competition recently decided for the heat scheme of warming, ventilation, &c., for the new Infectious Diseases Hospital, Leeds, the scheme and tender of Messrs. Dargue, Griffiths, and Co., Ltd., of 72, Grey-street, Newcastle, was formally adopted by the corporation of the former city.

The Wesleyan General Chapel Committee have just sanctioned proposals for the erection of 13 new chapels in various parts of the country, at an estimated expenditure of £38,980. This brings up the total to 26 within the past two months. One of the proposed new chapels is at Twickenham. Another new chapel, to cost £9,153, is to be built at Weston-super-Mare. It will seat 1,000 persons. A sum of £5,364 is to be expended on alterations.

It was reported to the Mancheater Corporation at the last meeting that the last arbitration under the Thirlmere water supply scheme had just been finished, and the award had been received. The late Mr. Watt was the contractor who did the work, and his executors went to arbitration, claiming £95,000 for extra work. The umpire sat a long time, and the result was that he awarded the executors of Mr. Watt £16,709.

Our Office Table.

In the Parliamentary Estimates for the ensuing year the total for Public Works and Buildings shows a reduction of £57,279. The chief feature is the disappearance of the Vote for extending Admiralty buildings, from Messrs. Leeming and Leemings designs, a service for which other provision will be sought. In the Estimate for Royal Palaces, which has risen from £34,000 to £58,000, there is included a sum of £3,500 for beginning the installation of electric light at Buckingham Palace, and £15,000 for further restoring the State Rooms and Banqueting House at Kensington Palace. In the Estimate for Royal Parks, &c. (increase £12,850), the maintenance sub-head has grown by £3,530, while the new works include the completion (£6,600) of the new wing to the Temperate House at Kew Gardens, and further improvements (£1,000) in lighting footpaths in St. James's, Green, and Hyde Parks. The Public Buildings Vote includes an item of £25,000 for alterations to Hertford House, purchased in 1897-98 at a cost of £80,000 for housing the Wallace Collection recently bequeathed to the nation. The Estimate for Public Works and Buildings, Ireland, contains an item of £2,000 on account of the commencement of the National Gallery extension in Dublin.

One of the first subjects with which the newly-elected London County Council will be called upon to deal is a proposal that the Council's sinking fund should be utilised for the purchase of well-secured freehold ground-rents within the Metropolitan area. The matter will come up on a report of the Finance Committee, in which the arguments in favour of and against the proposal are dealt with, and it is stated that there is a diversity of opinion upon the subject. On the whole, the committee think that well-secured ground-rents bought at fair prices would give a good return upon the purchase money, and that the Council would be justified, from a financial point of view, in asking authority to invest, with the consent of the Treasury, its sinking fund in that class of securities. At the same time, they do not think that the necessity has as yet arisen for seeking new investments for the sinking fund, which does not at present suffice to meet the applications from local authorities for loans, and money has to be borrowed yearly by the issue of new stock to make good the balance and meet the Council's own capital expenditure. If the sinking fund should at any time exceed the demand of its use, the question of other investments must be considered; but at present they do not advise the Council to apply to Parliament for power to invest the sinking fund attached to the Council's stocks in the purchase of ground-rents.

A meeting was held in the Douglas Hotel, Newcastle-on-Tyne, on Friday night, to consider the desirability of instituting a building trades' exchange on somewhat similar lines to those which have been successful in Glasgow and Edinburgh. There was a large attendance of gentlemen connected with various branches of the building trade. Mr. J. G. Walker presided. The Chairman said some time ago a representative meeting of the various trades was held, when it was determined that a deputation should visit Glasgow, and see how matters really stood there. The report given by the deputation was a satisfactory one, it being stated that the exchanges at Glasgow and Edinburgh had been distinct successes. Col. Bennett, of Glasgow, the founder of these exchanges in Great Britain, then gave an address, from which it appeared that the building trade exchange is an American institution. He said that at Glasgow they had proved to a certain extent the possibility of the existence of those exchanges in this country It was of the greatest importance to have a central office where they could at a certain hour expect to meet those engaged in different branches of the building trade. The exchange could be open from 8 till 5, the hours of meeting being from 11.30 to 1 o'clock. There would be a telephone, telegraph, special service of messengers, ample supply of business and daily papers, while the exchange would also be a place where they could exchange ideas. The public would have more confidence in the tradesmen they employed, and a better feeling would be established between the architects, the surveyors, and the tradesmen in general. Mr. David Cook, secretary of the Glasgow Building Trades Exchange, also addressed the meeting, and

Mr. Laird, also of Glasgow, explained that the exchange had nothing to do, as had been alleged, with keeping up prices. It did, however, say that the contracts should be carried out in a fair and honourable fashion. Mr. John Ferguson moved:—"That this meeting is of opinion that it is desirable that a Building Trades Exchange for the city and council of Newcastle, the borough of Gateshead, and the district generally should be formed, and appoints a committee to promote a limited liability company to carry out this object." Mr. W. Lister Newcombe seconded the resolution, which was carried unanimously. A committee was then appointed.

The annual distribution of prizes in connection with the Edinburgh Technical School for apprentices and young men of the house-painting trade was made on Friday night in the Heriot-Watt College, Edinburgh. Bailie Mackenzie presided. Principal Grant Ogilvie reported that over a hundred students had entered the classes, and the work done had been very good. The scholars had worked successfully and diligently, and their conduct had been entirely satisfactory. The report of the examiners (Messrs. Thomas Kirkpatrick, Leith, and David Bisset and Thomas Hardy, Edinburgh), stated that the exhibition of work for the session reflected great credit on teachers and pupils alike. The chairman, in presenting the prizes to the pupils, impressed upon them the benefit of technical education in preparing them in all matters concerning their trade. The following were the principal prize-winners:—Class medallists: Class A, Alexander Flynn; Class B, Duncan Gollan. First grade for first and second year apprentices: Plain work, George Keppie; lettering, John Heatley; lining and stencilling, George Glass. Third and fourth year apprentices: Plain work, James Russell; lettering, Duncan Gollan; graining, Robert Wishart; lining and stencilling, George Taylor. Fifth and sixth year apprentices: Lettering, Robert Heriot; painted panels, J. R. Cantley. Certificates were also awarded to apprentices for graining, lettering, and painted ornaments.

The Ontario Association of Architects have decided to petition the Ontario Government to grant a sum of money to defray the cost of making scientific tests at the School of Practical Science, Toronto, of the various native woods adapted to building requirements. The series of tests of Canadian building stones made a few years ago, under the direction and at the expense of the association, have proved so valuable that, in many portions of the Dominion they have taken the place of reference tables and practice. The authorities of the Toronto School of Science have also conducted tests of native books formerly employed by architects in their bricks, concrete, and cement, so that the qualities of these materials are in a measure understood. No adequate tests have yet been made, however, of native building timber. In view of the extent to which wood is employed for supports in buildings it is desirable that the strength and physical characteristics of the various woods employed should be well understood, in order that the requisite factor of safety may be used.

The thirty-third annual report of the trustees of the Peabody Donation Fund for 1897 states that the year's net gain from rents and interest has been £32,320. The total fund on December 31 last was £1,220,446. Of the £85,000 advanced by the Bank of England, the trustees have repaid £53,500, leaving a balance of £31,500 still due. The capital expenditure on land and buildings to the end of the year was £1,250,390. The whole of the repairs for the year, amounting to £12,232, which include extensive structural and drainage alterations at Islington, Shadwell, and Stamford-street, have been charged to income as formerly. At the end of the year the trustees had provided for the artisan and labouring poor of London 11,367 rooms, besides bath-rooms, laundries, and lavatories. These rooms comprised 5,121 separate dwellings—viz., 86 of four rooms, 1,781 of three rooms, 2,426 of two rooms, and 828 of one room. The death-rate, including the deaths of 69 inhabitants of the buildings removed to hospitals, was 15·4 per 1,000, which is 2·8 per 1,000 below the average of London.

The old-established and wealthy Guardian Fire and Life Assurance Company, which has hitherto confined its business to fire and life assurance, is now issuing accident policies of all kinds, and is prepared to consider proposals for the insurance of the entire liability of employers, under the Employers' Liability Act and the new Workmen's Compensation Act, without any limitation. The "Guardian," with its large capital and resources, offers unequalled security for such protection. It has a paid-up capital of £1,000,000, and a subscribed capital of £2,000,000, and the latter with the fire funds £526,850, amounting in total to £2,526,850, is the security for the policy-holders of the company generally, including accident policy-holders. The anxiety of any of the life policy-holders, who may, perhaps, imagine that the life funds are liable for fire and accident risks, may be at once relieved. The life funds of the "Guardian," in common with those of every life company, amounting to £2,818,721, are secured to them by Act of Parliament, and are, therefore, liable only for the life assurance and annuity contracts of the company.

The Prudential Assurance Company, in its forty-ninth annual report, states that the number of policies issued during the year was 65,893, assuring the sum of £6,698,755, and producing a new annual premium income of £365,996. The premiums received during the year were £2,774,264, being an increase of £231,002 over the year 1896. The claims of the year amounted to £707,613. The number of deaths was 5,038, and 656 endowment assurances matured. The number of policies in force at the end of the year were 497,327. In the Industrial Branch, the premiums received during the year were £4,793,591, being an increase of £214,798. The claims of the year amounted to £1,823,338. The number of deaths was 192,359, and 1,876 endowment assurances matured. The number of free policies granted during the year to those policy-holders of five years' standing, who desired to discontinue their payments, was 60,848, the number in force being 549,889. The number of free policies which became claims during the year was 10,716. The total number of policies in force at the end of the year was 12,546,132; their average duration exceeds eight and a quarter years. The assets of the company, in both branches, as shown in the balance-sheet, are £30,438,337, being an increase of £3,379,226 over those of 1896.

Owing to increased business, Messrs. T. and R. Boote, Ltd., of the Patent Tile Works, Burslem, are removing their London office from Waltham Buildings to more convenient premises at Birkbeck Bank Chambers, Southampton Buildings, Holborn, E.C. The change will take place on March 25, and will no doubt be duly appreciated by their customers, whose wishes will, as heretofore, be attended to by Mr. Thomas Foster, the courteous agent of the firm. Messrs. Boote have recently completed some important contracts for tiling, amongst which are the Blackwall Tunnel, Rangoon and Pretoria Government Offices, and almost the whole of the interior of the Birkbeck Bank Buildings, in which their office will in future be situated, and which will therefore be a permanent specimen of their work.

The fabric of Christ Church, Mold Green, near Huddersfield, is about to be completed by the addition of a chancel and vestries, from plans by Mr. G. F. Bodley, A.R.A.

A dispute as to the ownership of Bridgewater-square, City, was decided on Tuesday by a special jury in the Queen's Bench Division. The plaintiffs, Trustees of Cripplegate Without Boys' Charity School, claimed to be owners of the square, which was formerly the Courtyard of Bridgewater House, the seat of the Earls of Bridgewater, by virtue of a twelve years' undisputed possession. The defendant, Mr. George S. Tranter, who is a member of the Common Council, a resident in the square, and the owner of six houses, contested the claim, urging that the plaintiffs had only been permitted to use the square as a drill-ground through the kindness of the neighbours. A verdict was returned for the plaintiffs.

The Lord Mayor of London and Sheriffs will visit the Northampton Institute, in Clerkenwell, on Friday in next week, the 18th inst., for the purpose of formally declaring it open. The buildings and equipment have up to the present cost over £80,000. In addition, the land, generously given by the late Marquis of Northampton, is estimated to be worth not less than £25,000. We illustrated the buildings, which have been erected from designs by Mr. E. W. Mountford, F.R.I.B.A., selected in competition, in our issue of April 11, 1893. The style is Free Renaissance, the facing materials being red Ipswich bricks with dressings of Monk's Park stone. Mr. Walter Wallis, of Ramsden-road, Balham, was the builder, and Mr. Isaac Gard the clerk of works.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Society of Arts. "The Thermo-Chemistry of the Bessemer Process," Cantor Lecture No. 1, by Prof. W. N. Hartley, F.R.S. 8 p.m.
Carpenters' Hall Lectures. "Architecture versus Building," by Professor Banister Fletcher, F.R.I.B.A. 8 p.m.
Bristol Society of Architects. "Architectural Photography," by G. C. Lawrence. 8 p.m.

Tuesday.—Society of Arts. "The West Indies and Sugar Bounties," by Nevile Lubbock. 4.30 p.m.
Institution of Civil Engineers. "Calcium Carbide and Acetylene," by Henry Fowler. 8 p.m.

Wednesday.—Society of Arts. "The Recent History of Paper-Making," by Clayton Beadle. 8 p.m.
Edinburgh Architectural Society. "Ecclesiastical Decoration," by T. Kershaw Bonar. 8 p.m.

CHIPS.

The parish church of Dovercourt, near Harwich, has just been reopened, after restoration under the direction of Messrs. J. E. K. and J. P. Cutts, of London.

The clock purchased by the inhabitants of Kilham, near Driffield, to commemorate the Diamond Jubilee, now being erected by Messrs. Potts, of Leeds, will be started at noon on Sunday next, March 13.

The new city hospital, Ham Green, Bristol, is being warmed and ventilated throughout by means of Shorland's patent double-fronted Manchester stoves, with ornamental tiled sides and with descending smoke-flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

A local syndicate has been formed to promote the construction of a light railway to connect the Great Western system at Brent Knoll with the town of Burnham. Plans have been prepared by Mr. W. H. Aitchison, C.E., and Mr. Chas. S. Leech, of Burnham, joint engineers for the scheme, which provides for a terminus station near the cemetery at Burnham, at a point dividing the business portion of the town from the rapidly-extending residential part. It is proposed that the ordinary gauge should be adopted.

At Monday's meeting of the Morley Town Council five candidates for appointment as borough surveyor and engineer, at a salary of £200 per year, appeared before the council, and it was decided to appoint Mr. W. E. Putman, of the City Engineer's Office, Leeds.

At a public meeting held at Paisley on Monday, under the presidency of Sir M. B. Shaw Stewart, Lord Lieutenant of Renfrewshire, it was decided to take steps for the restoration of Paisley Abbey, in accordance with plans prepared by Dr. R. Rowand Anderson, of Edinburgh. A large and representative committee was elected. It was agreed that the restoration of the abbey should be accompanied by an improvement in the surroundings of the abbey, and that it be remitted to the same committee to consider how best this could be done, and the probable cost of acquiring and laying out neighbouring properties.

About fifty applications have been received for the vacant post of burgh surveyor and sanitary inspector of Peterhead. These have been reduced to a short leet of five, consisting of Messrs. Fleming, Dundee; Shand, County Engineer's Office, Aberdeen; Chisholm, Burgh Surveyor, Buckie; Black, Edinburgh; and Budge, Leith.

A deputation from the Glasgow Corporation, consisting of Baillie J. M. Johnson, Baillie R. Anderson, Mr. S. B. Macdonald, M.Inst.C.E., and Mr. T. S. Melvin, manager of the Glasgow sewage works, visited the Manchester Corporation sewage works at Davyhulme on Monday.

Alderman Baker, Alderman Barratt, Councillor Stembridge, and Councillor Fletcher, representing the Improvement Committee of the Birmingham City Council, with Alderman Cook, and Councillors Martineau and Lancaster, representing the Health Committee of the same body, went on Wednesday as a deputation from Birmingham to Liverpool to inspect the provision made by the Liverpool Corporation for the housing of the working classes, and to inquire into the working of the dual system of house-building adopted in that city. The deputation were accompanied by Mr. Adie, the retiring manager of the improvement scheme, and Mr. J. Tart, his successor, and by Mr. H. Price, the city surveyor. They were received at Liverpool by the Lord Mayor and the town clerk, and other members of the corporation, and after their round of inspection were entertained at dinner by the Lord Mayor.

Trade News.

WAGES MOVEMENTS.

Bristol.—At a combined meeting of the Carpenters' and Joiners' Societies, held at the Shepherds' Hall, Old Market-street, important changes have been agreed upon in connection with the amended rules regulating their work in Bristol. Notices of these proposed changes, to take effect on July 1st next, have been given to the Master Builders' Association and other employers in the city, with a hope that they would make the concessions asked for on the date named. The operatives ask for 8½d. an hour instead of the present wages of 8d. an hour. With reference to working hours, they ask to reduce the time generally from 48 to 47 hours per week during the months of November and February, and a similar reduction in hours in builders' yards in the months of December and January. Other alterations are asked for with regard to country work and overtime. Other branches of the building trade have sent in similar notices. The monthly meeting of the Master Builders' Association of Bristol is to be held shortly, when the matter will come under consideration.

Lincoln.—The master builders have acceded to the demand of the plasterers for an advance of 1d. per hour in the rate of wages. The new rate, 9d. per hour, has come into force.

Scarborough.—The Scarborough stonemasons have been conceded an increase of ½d. per hour, making 8½d. Commencing on April 1st, work will be begun at 6.30 and extend over nine hours, and in the winter months the men will start at seven and cease at five o'clock. The men asked for 9d. an hour.

Birmingham Building Wages.—In accordance with the agreements existing between the various sections of the building trade and the Birmingham Master Builders' Association to the effect that six months' notice shall be given on either side for the alteration of rules, the scale of pay, &c., the representatives of the carpenters, plasterers, masons, plumbers, scaffolders, and labourers gave notice in October last of their intention to claim an increase of wages dating from the 1st of April next. In the case of each of the skilled branches, the increase asked for is at the rate of 1d. per hour, whilst the labourers and scaffolders ask for ½d. per hour. Notices were also given by the men of certain alterations desired by them in the rules. Since October several meetings have been held to discuss the situation on both sides, and, owing to the abnormal briskness of the building trade, the operatives have been encouraged to enforce their demands in their fulness. In view of the fact that the granting of the increases asked for would mean an enormous difference in the profits on existing contracts, the employers considered that the offer of an advance of ½d. per hour, to come into operation in April, 1899, would be fair, whilst, on the other hand, the operatives have decided that if the ½d. is granted for the current year they would accept such a settlement as satisfactory now. The latter proposition has not yet been discussed by the masters.

The death is announced of the distinguished French architect M. Louis Petit-Grand.

The new headquarters of the Volunteer Medical Staff Corps were opened by the Lord Mayor of Leeds on the 8th inst. The new premises, which are situate in St. James-street, consist of a drill-hall, staff offices, orderly offices, clothing stores, and residence for staff-sergeant. The rear portion of the site has been reserved for the erection of a model hospital in the near future. The work in connection with this corps has been carried on by Surgeon-Captain De Burgh-Birch from its formation. The new buildings have been erected from plans prepared by William Bakewell, F.R.I.B.A., of Leeds.

At Killick's-road, Mitcham, Surrey, on Saturday, Feb. 26, the foundation-stone of the new church of St. Mark was laid. The church will comprise nave and aisles, north and south transepts, apse, baptistery, north porch, and a small bell turret, and will have 400 sittings. The architects are Messrs. R. M. Chart and Son, of Union Bank Chambers, Croydon and Mitcham, and the contractors are Messrs. D. Stewart and Sons, of Wallington, the amount of their contract for the first portion (nave and aisles), exclusive of furnishing and heating, being £3,319.

The foundation-stone of the new Church Institute and Parochial Hall connected with St. Paul's Church, Prince's Park, Liverpool, was laid in Miles-street, on Friday, by the Hon. Mrs. M'Neile. The new building will be of two stories, and will consist of several classrooms, a large room to contain 400 people, and two other large rooms which can be thrown into one for the purpose of a gymnasium and recreation-room. The total cost will be £3,200. Messrs. Willink and Thickuesse, of Liverpool, are the architects.

CHIPS.

Among the members returned to the London County Council on Thursday in last week, were Mr. Walter Emden, J.P., the President of the Society of Architects, who was re-elected for the Strand Division, and Mr. Howell J. Williams, builder, of Bermondsey, formerly member of the Council for Rotherhithe, and now returned for South Islington.

The town council of Taunton decided on Tuesday to adopt the septic method of treating sewage in use at Exeter, and instructed Messrs. Cameron, Comnin, and Martin, of Exeter, the patentees, to prepare plans and estimates.

At Hayward's Heath, on Tuesday, Herbert Chapman, described as a London journalist, was committed for trial on a charge of obtaining credit for £69 by false statements. It was alleged that he took a house at a rental of £128 a year, but had paid no rent. The alleged false statements were that he edited the *Builders' Journal* and the *Architectural Review*, and that his wife was related to the Duke of Richmond. Evidence showed that the accused was a canvasser, and that he earned £80 a year.

The Local Government Board has given notice that Col. A. G. Durnford, R.E., one of the Board's inspectors, will hold a local inquiry at the Guildhall, York, to-day (Friday), in reference to the application of the city council for sanction to the borrowing of £23,000 for sewerage purposes.

Owing to a desire on the part of several important exhibitors for more time in which to prepare their exhibits, it has been found necessary to delay the opening of the Building Trades Exhibition at St. James's Hall, Manchester, to June 20, 1898.

A disused building, intended for infectious cases and standing in the grounds of the Melksham Union Workhouse, Wilts, has recently been transformed, at a cost of £1,260, into an up-to-date infirmary for 30 patients, upon plans prepared by Mr. Walter W. Snailum, P.A.S.I., architect, Trowbridge. Mr. E. Linzey, of Trowbridge, was the contractor.

AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2251.
FRIDAY, MARCH 18, 1898.

INSTITUTE OF PAINTERS IN WATER COLOURS.

A VARIETY of methods and of merit is to be seen in this popular exhibition of water colours. There are not only works which savour too much of the mere picture buyer, and which show the desire to bring down painting to the level of the average public, but others which aim at higher ideals. We can notice only a few of the more meritorious contributions. John Fulleylove, whose early architectural training has made him faithful to his early love, sends several bright and spirited water-colour sketches from the Continent. His "Hotel de Ville, Bruxelles," and other views of that city "The Parthenon from the Propylæa" (42), "The Caryatid Portico of the Erechtheum, Athens" (153), &c., are all truthful and feeling sketches, in which drawing is not sacrificed to effect. Several very beautiful pictures by Frank Walton of the Cornish coast are hung. We may particularly notice here his view of "The Land's End" (2), "Cape Cornwall" (616), his "Black Rock, Widemouth" (360) "Bude Haven" and "Breakwater" (442-617), all careful and pleasing transcripts. In the same gallery we notice "A Sandy Road" (4), the summit of a hill, by Joseph Knight, inimitable and dextrous in manipulation; a broad sunny sketch in Berkshire, by Edward H. Fahey (12). The president, Sir James Linton, has four subjects. "Roses" is a beautiful, but rather coldly-painted, face in Sir James's best style, graceful in drawing and admirable in technique. The bowl of rich pink blossoms which the dark girl holds daintily in her hands, and the rich yellow brocade sleeves of her bodice, the red coral necklace and pearl trimmings, are exquisite, but there is the fault of hardness. His Shakespearian subjects, "Slender and Anne Page" (190), and "Portia Sending the Letters to her Cousin" in the Merchant of Venice (245) are interesting as examples of the president's claims as a subject-painter. His other single figure "Jaqueline," "Quentin Durward" (357) is more successful, the daintily-shaped little silver goblet which the brunette carries, with a plate of fruit on a waiter, the scarlet skirt and green bodice of the girl make a picturesque subject. Very energetic and forcible is the large centre picture, "Waiting for the Fishing Boats," by Hans von Bartels.

The vice-president, E. M. Wimperis, is also strong. His "Hayfield" (21), is a breezy, fresh landscape, and his "Marsh near Bawdsey Ferry" (89), and "Wet Sands" (177), are all excellent in breadth and colour. Mr. Wimperis is a master of broad expanses of moors and marshes, and he throws the charm of passing shadow and sunlight over them, and gives us the suggestion of showery weather and breeze—some of these are studies in Cornwall. R. B. Nisbet, in his "Waiting for the Tide, Stonehaven," is delightfully quiet and broad. It is a still evening effect: the sombre shades of the harbour and craft stand out from the illumined sky and water-reflected light. Mr. Nisbet has instructively felt the deep solemnity and subtle mystery of the afterglow and mists of his Northern clime, and in this and his Perthshire scenes, "Wet Day," "Afterglow," "Moonlight," "Stormy Day on the East Coast" (555), he has abundantly proved his skill and power in this phase of landscape. A bright sketch, "Old Street, Salisbury" (103), by Miss K. Gordon, must be mentioned; but, perhaps, the chief landscape is Bernard Evans' very fine view "From Gourdon to the Mediterranean" (113), a grand sweep of rocky hills. The stratified rocks and verdure, the vast perspective of receding hills, and the distant sea are painted with power in this landscapist's most forcible manner. His other subject is "Fountains Hall and the Ladies' Garden, Yorkshire," in the East Gallery. Other pictures that have merit are Miss Rose Douglas' "Market Day, Etaples" (25), a delightfully drawn and brilliant view of a busy market-place, executed in a few telling strokes of the brush; St. Geo. Hare's clever study of a girl by the sea, near rocks, holding her scarlet-lined sunshade during a sudden gust—"Breezy" (32); Innes Fripp's "Treasure Trove," drawn with refined technical skill; John I. Richardson's admirably broad view, "On a Perthshire Moor" (41); David Green's "Misty Morning, Polpeiro," grey and wet; James Tower's clever coast scenery, "Perwick Bay" (53); and works by St. George Hare, "A Breaking Wave" (57); John Muirhead, Ernest Parton, and Miss Christina Allan (104), charming sketch of "Fishing Village" and fresh colour. William W. Collins's "The Deserted Copper Mine," is a colour-study, really a background for a nude figure of a woman at her toilet, well drawn and strong in the colour of the rocky cavern, and its shades of blue-green and reds. Max Ludley is Turner-like in his large, brilliant-toned landscape No. 142: the atmosphere and light are excellent. The delicacy of colour and mist in F. Stuart Richardson's "Cormorant's Crag, Stonehaven" (149), must be noted; and Robt. Hughes' bold forest scene (141) and S. Marjoribanks' "Mist, Wind, and Rain" (168) are other works of merit. Harry Hine has a broad study, "An Old Bridle Way" (162). Count Seckendorff has a brilliant view of "Scala di Spagna, Rome" (155).

In the Central Gallery, one of the best subjects—merely a sketch study on grey paper—is George Weatherbee's "A Lonely Shore" (179), a mother and child crossing a bleak shore of sandy hillocks. Simple in drawing and arrangement, the artist succeeds in giving us a study in which there are all the elements of a good picture. A. Kinsley's "Across the Moor" (198) is bold and strong in colour; and we must also notice for its unaffectedness Alfred East's "Haverstock Hill" (187). John R. Reid's boat and fishing scenes are, as usual, brilliant and strong, but not such successes as his oils. "When the Boats come in (Scheveningen)" (201), "Waiting for the Boats" (363), "The Gipsy's Home" (208), and others in the East Gallery are at least fresh in colour.

A great many commonplaces meet us, as "The Music Lesson," and many studies of *genre* hard and crude that would have been better unhung, as Nos. 241, 248, 243, 256, &c. William Evans's child study (215) has simplicity; Henry Ryland's delicate fair maiden study, "Doris" (220), with her brown thick tresses and background of lilies, is dainty. Walter Langley's "Day Dreams" (227), a country woman outside her cottage door meditating, is one of the best subject pictures. J. Aumonier, in "A Chalk Cliff," has chosen a bold and striking subject. The sun illumines the cliff, which forms a background to a group of farm buildings and its pool. His other work is also pleasing and unaffected, and has a sense of atmosphere, as in "A Flowery Mead." "A Bridge on the Stour," by Yeend King (233), is a pleasing subject handled with care, and "Near Dartmouth" (281); and we must notice Arthur A. Dixon's "Dawn," a child's face (234); "A Savoy Garden" (256), by A. Parsons; a pleasing portrait of a girl, with a decorative motive, by Henry M. Rheam; W. T. M. Hawksworth's drawing of "An Old City Church," with its carved pulpit and sounding-board; Edgar Bundy's "Market Day," a clever group of country folk in a country inn parlour —a character study of faces; a sunny hillside sketch, "In a Swiss Garden, Lake of Zurich," by Miss Jane Inglis (327), are of interest. One of the cleverest pieces of *genre* is Mrs. Lydia J. Price's "The Première Danseuse" (365), a highly-amusing bit of drollery—Dutch dolls, with their wooden stare and expression, looking at a figure of a dancing girl, a piece of grotesque pleasantry that will provoke much mirth. H. E. Tidmarsh (404) has a good drawing of "St. Mary-le-Strand"; Terrick Williams has a nice grey evening effect (405); and C. Maciver Grierson's "An Old Maid" are clever. We need not say that Edwin Hayes, R.H.A., contributes several of his inimitable seascapes, as a "Guernsey Fishing Boat Entering Harbour" (366).

In the East Gallery, John Gulich's picture, "The Violin Concerto" (435), is unquestionably the highest piece of art in the room, though its handling and solid treatment is more suitable for the oil medium. The observer faces a vast orchestra in serried ranks during the most impassioned part of the performance. The central figure is a young and beautiful vocalist in white satin robe, taking the chief part; at her feet have been flung the choicest roses. The painter has endeavoured to realise the ecstatic delight and rapture of the melody by the hovering light which soars upwards from the songstress, and which seems to realise the very spirit or afflatus of music. With its faults of execution, there is much invention shown. A beautiful coast scene, "Aberdeenshire" (428), is by F. Stuart Richardson, the subtle blending of tones being charming. Edwin Hayes, "Fishing Boats, Hastings"; William W. Collins, "Easter Morn" (461); Miss Anna Nordgren, "Quand on est Jeune" (471); Dudley Hardy's sea-coast subject, "Last Load," are all pictures of interest. One of the chief works is Walter Langley's "In the Fishing Season," a group of fisher-women on a beach of rock at the foot of cliffs. The same delineation of character, the same light and freshness, are seen in this as in former achievements, and the work will rank with many of them. A large picture, "Evening Dews and Moonset" (540), by Edward Read, realises the evening misty effect of dews under moonlight; James Orrock's large landscape, "Barford Mill, Warwickshire" (549), is one of the chief of his three contributions. There is the Constable-like manner we have noticed before in this master's treatment of foliage, a glittering dewy effect. Walter J. Morgan's large figure subject "A Reverie," a young woman in blue dress standing at an open window. The letter in her hand suggests the cause of her wandering thoughts. F. G. Cotman (551) sends a small but delightful sketch "From a Lowestoft Cliff." There is simplicity and nice drawing in Harry E. James's "Old-street, Amesbury," and R. B. Nisbit's grey-toned seascape, "Stormy Day on the East Coast" (555), must be mentioned. A large view of "The Cliff, Bagot Park," is by Fred. Mercer, a piece of bold forest painting. Luminous is David Green's fisher folk on sands "Waiting for the Tide" (559). Thos. Pyne has a careful but mannered study of landscape (563). The scheme of intense colour in T. Austen Brown's "By the Blue Sea" is strong; two girls, one stooping to pick up a pebble, are drawn with poetic power. The sea blue is intense, and contrasts strongly with the fresh face. Miss Louis Rayner (in 572) sends a careful drawing of Wrexham. J. Aumonier has several drawings of the Old Chain Pier at Brighton (573). Arthur Burrington has a large picture entitled "Cinderella" (611), in which the composition and colour are successful; and above it Stuart Lloyd has a view of "Worcester." There is some poetry in W. Lee Hankey's "Une Vierge" (636),

study of a peasant girl trudging home with her crook in the waning light of evening near the sea. The picture by G. Sheridan Knowles (499) is pretty and graceful in drawing and delicate in colour, and there are several other works of a pleasing but commonplace order.

MODEL SPECIFICATIONS.—IV.

DRAINAGE AND BRICKWORK.

We now give plans of the drainage of two town houses, such as are built in ordinary streets (see plans 1 and 2). Both show a main 6in. house-drain laid beneath the basement floor to a sewer in front with 4in. branches. At the head of drain a chamber is built 2ft. square or more, which receives the discharge of sinks and wastes. Another manhole is built to receive the soil-pipe, and a disconnecting manhole 3ft. by 2ft. 6in. with intercepting trap with cleaning branch (already described) near the sewer end of drain. In specifying, the following clauses may be adopted:—

Connection with Sewer.—Due notice to be given to local authorities, and pay fees for connecting with sewer, and for inserting a galvanised iron flap for a 6in. drain, and making good to road, curbing, and pavement.

Disconnecting Manhole.—Build a disconnecting manhole, A, in area 3ft. 6in. by 2ft. 6in. in 9in. brickwork in cement on concrete lined with glazed bricks inside. Insert a Doulton's 6in. (or Hellyer's or Crapper's) stoneware intercepting trap having a 4in. cleaning branch with cap. On the concrete bottom lay a 6in. glazed channel invert (or half pipe) 3ft. long, and 4in. junctions. Form the sides and render in neat cement to even and smooth falls. An air inlet 6in. diameter to be introduced carried up area wall (or as directed), with iron grid or Hellyer's mica flap, or connect manhole to a 6ft. length of 4in. iron rain-water pipe fixed to wall, with approved outlet.

Other Manholes.—Build the other manholes, B and C in plan, 2ft. 6in. (or 3ft. by 2ft. 6in.), and at the proper depths with footings on concrete, and line walls with white glazed bricks, and connect the manholes with a 6in. (or 4in.) stoneware pipe laid to a fall of—in 10ft.—straight in line, and even in gradient. The pipes to be incased in cement concrete 18in. square when finished; the concrete to be hollowed out at every socket, so that the pipes may have a firm bedding. Or—

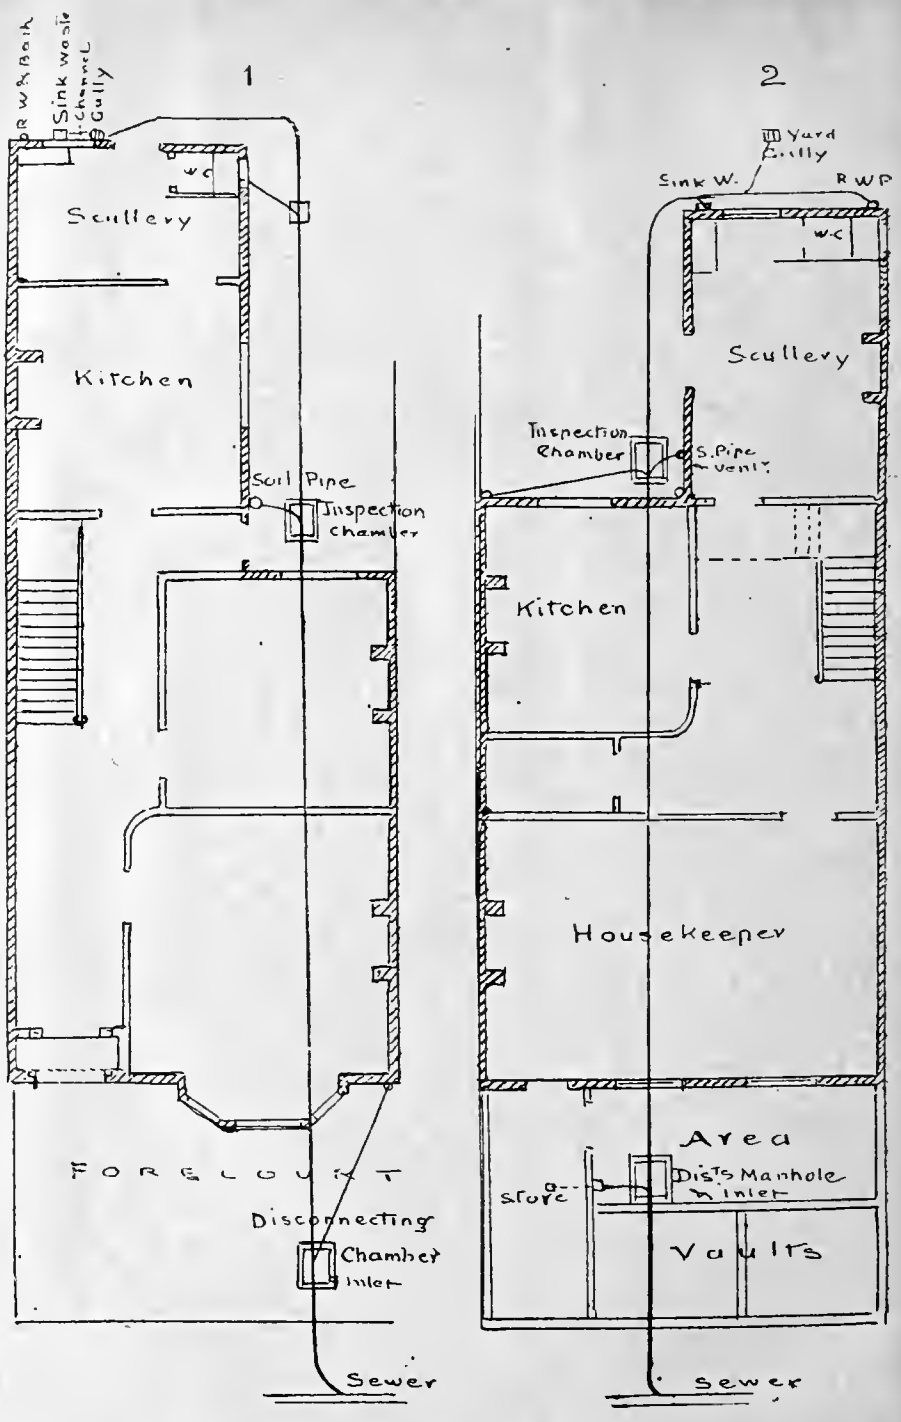
Connect with iron drain-pipes, well caulked and jointed with molten lead in concrete.

Branch Pipes.—Connect the feet of soil-pipe, rain-water waste, and gullies to the manholes with 4in. stoneware pipes, with proper bends, incased in concrete, and put Doulton's (or Hellyer's) gullies and traps where required, with iron grids in stone curbs, &c.

PRELIMINARY NOTES ON BRICKWORK.

In the construction of buildings many important points should be considered. First, as to dry walls. It has been calculated that ordinary cottage walls, one brick thick, consisting of 12,000 bricks, are capable of holding 1,500 gallons or 6½ tons of water. Hence the importance of damp-proof courses, dry areas, hollow walls, and other means of arresting the moisture to which brick walls are exposed. Where the ground or lowest floor is below level of outside soil, a dry area, or what is sometimes called an air-drain, becomes necessary. We give one or two sections of this arrangement (see sketch, *c*). The outer wall should be 9in. in cement, and the air-drain or space 12in. wide, covered by weathered flagstones (see section 2). A perforated damp-course or air-holes should be introduced beneath plate of joists, as shown, and air-ducts formed at intervals (see sections). Sometimes, when space is valuable, the inner brick wall can be protected from moisture by a vertical lining of White's Hygeian Rock composition between the two casings, as shown (section 3).

Damp-courses should be 6in. at least above external ground surface, and they should be placed under the lowest wall-plate. There are several kinds of damp-courses:—(1) Glazed pottery slabs (perforated), like those of Doulton, Jennings, &c.; (2) layers of asphalte ⅜in. thick; (3) slate in cement (two courses); (4) sheet lead (see Fig. 4).

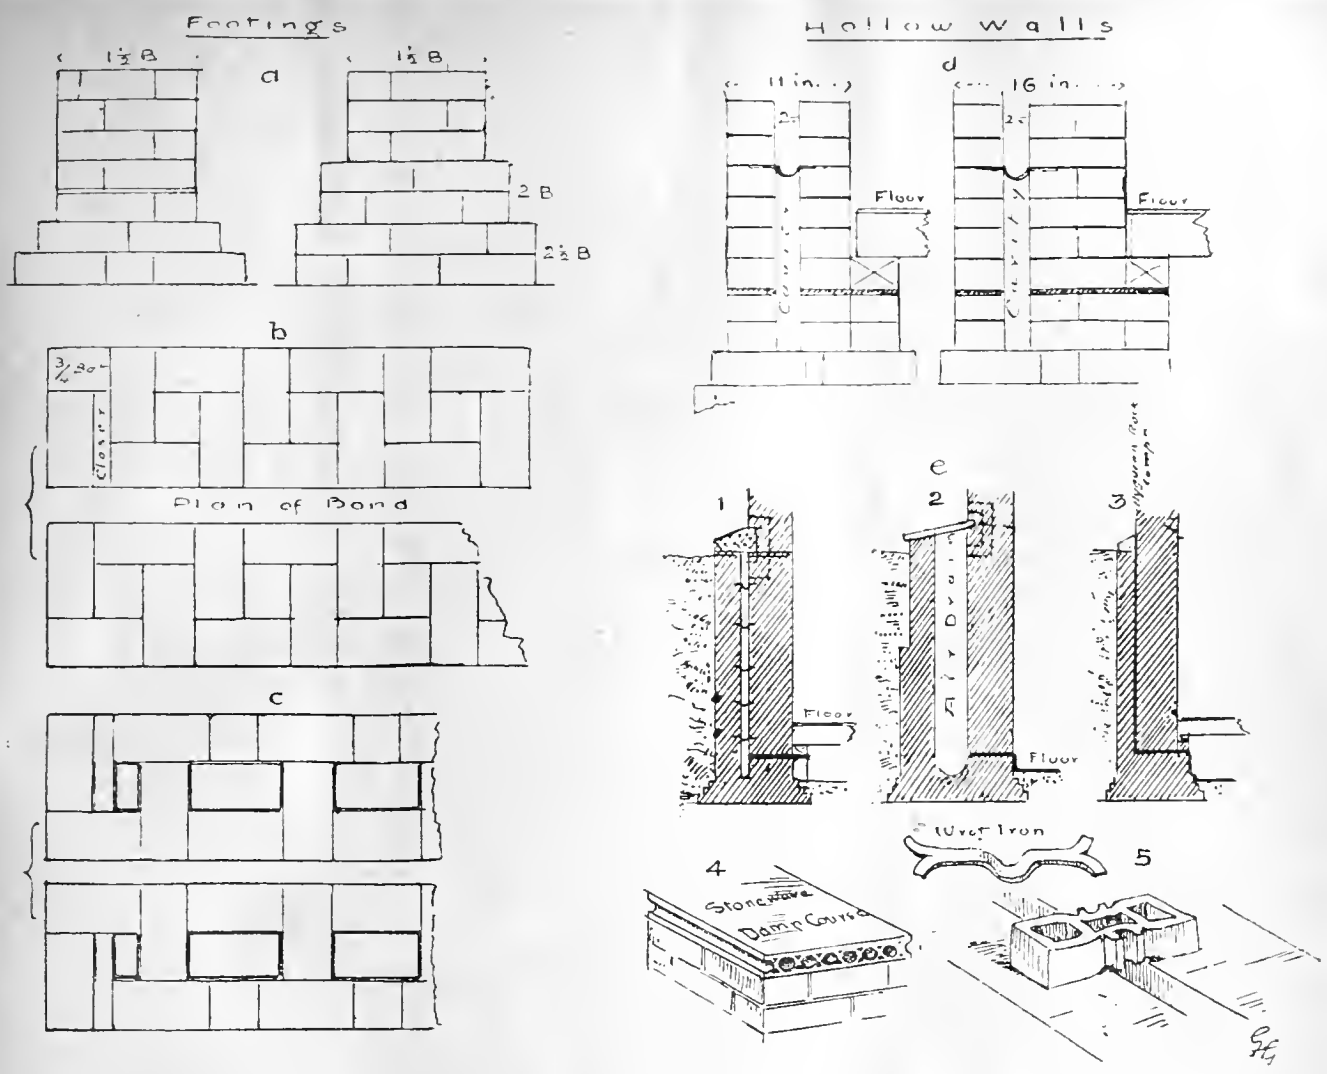


It is necessary, also, to put a damp-course in all brickwork above the roof-level, like stacks, parapets, gables, &c. The layer of asphalte or lead should be laid above the flashing of gutter in a parapet.

Footings should be built of hard, well-burnt bricks, and care should be exercised that the lower courses should be properly composed of headers, and that bats and broken bricks be avoided. They should spread on each side of the wall half the thickness of wall, and diminish in regular 2¼in. offsets. In specifications for important buildings it is necessary to describe in detail the number of single or double courses, and to insist that no bats or snapped headers be used in making the offsets. The lowest course should be double. Hard bricks and good hydraulic mortar ought to be used.

Bond, too, is important, and ought to be specified more fully than it is, especially in important buildings. We give plans of two kinds of brick-and-a-half walls. The first shows half-bricks in the centre of wall, and a three-quarter bat used in the inside. As it is plastered inside, this arrangement is admissible, and is strong (see *b*). The bond shown at *c* is often used; it has a closer on each course, which weakens the bond internally, as shown by the thick line; *b* is stronger.

Then it is important to specify that the bond between a main wall and a thin cross-wall be so arranged by bats that the cross-wall is tied into the main wall (we shall show plans of this). If a half-brick inside wall join an outer brick wall, one course will simply abut against the main wall; but in the next course two bats are used at the end of the thin wall which runs right through the outer so that a bond is secured. Again, in 2 and 2½ or 3-brick outer walls the cross walls may be half-brick less in thickness. In every alternate course, the bond is secured by the cross wall entering into the substance of the outer wall, giving a one-brick tie. Then attention should be given to the arranging of the bricks at right and other angles. Generally a "closer" is introduced in each course, but in different directions. So also the bond at window and door openings ought to be specified. To prevent straight joints occurring between the reveal and jamb, "king closers" or



mitre-cut bricks are necessary at the inner angle between reveal and jamb. We show sections of hollow walls *d*, one 11½in. thick, consisting of two half-brick thicknesses, and a cavity of 2½in.; the other, one of 16in., showing the 9in. wall inside and a 4½in. outside, with a cavity of 2½in.

BRICKLAYER.

In a properly-prepared specification the bricks to be used should be described, naming the field or the manufacturer's name. It is necessary also to require a sample deposited with the architect, though this precaution is of little value unless the bricks delivered are carefully examined as they come in by the clerks of works.

The best building bricks used in London are called "stocks"; but they vary much in make, quality, and colour. Those called Malms are the best variety, and of a decidedly yellow colour, and from this circumstance and their evenness of texture are well adapted for facing-bricks, gauged arches, and dressings. Malms go under several names—cutters, best seconds, facing paviours, hard ditto, shippers, grizzles, and place; the latter are imperfectly burnt.

For superior buildings, where a pleasing stonelike tint is desired, the Suffolk whites are often used for facework. For good work in London the "Malm Cutters," "best seconds," or "facing paviors," may be used; but for ordinary building "Malm paviors" or "washed stocks" do fairly well. "Grey stocks," though not uniform in colour, make good fronts. For foundations, hidden, or rough work, rough stocks, grizzles, place bricks are employed. The best for red work are cutters or red rubbers, such as the Fareham Reds, or the well-known "T.L.B." made by Lawrence and Co., Bracknell.

A few general clauses on materials are the following:—

1. *Bricks.*—The bricks to be hard, sound, and well-burnt, of even size, having a metallic ring when struck. Or—

   All bricks to be well burnt, of uniform size, square in shape, free from cracks, stones, flaws, and other defects, and equal to samples deposited with the architect for approval. Soft or "place" bricks will not be allowed to be used, and bats only to be used where necessary for bond. The external wall (or other portions shown) to be built with best London stocks (or malms), and to be faced with Suffolk whites (or Fareham "reds"). Or, in London—

   The brickwork generally, except when shown, to be executed in superior bricks, or hard, square well-burnt stocks (or approved grizzles).

2. *Wetting Bricks.*—The bricks to be well wetted before being laid, and the joints to be well flushed up as the work proceeds.

3. *Lime.*—The lime to be freshly-burnt Dorking (or Maidstone) stone lime, or freshly-burnt blue lias lime from Barrow or Aberthaw.

4. *Sand.*—The sand to be clean, sharp Thames grit from above bridge, washed and screened and free from salt. Or—

   The sand to be clean, sharp, pit or river grit, free from loam or other impurities, and well washed.

5. *Mortar.*—The mortar to be composed of fresh-burnt grey stone lime, and clean, sharp pit sand, in the proportion of 1 part lime to 3 (or 2) parts of sand, mixed and used fresh every day. Or—

   The mortar to be composed of fresh-burnt, slaked, and screened grey chalk or stone lime, and clean, sharp pit or fresh river sand, in the proportion of 1 part lime to 3 parts sand, measured in boxes, mixed dry on a wood or stone floor, and water added till the whole is incorporated and brought to a proper consistency.

(Sometimes clean broken brick rubbish is used instead of sand. This should be finely ground in a pug or mortar-mill.)

Black or Blue Mortar.—The blue (or black) mortar for pointing to be composed of 2 or 3 parts of blacksmith's ashes, finely sifted, and mixed with three parts of grey chalk lime and 4 parts of sand. Or—

Two parts sifted forge coal ashes to 1 part of stone lime.

Cement Mortar.—For foundations, piers, and other portions of work shown, cement mortar is to be used composed of Portland cement, and gauged one part cement and three parts sand. Or—

To be composed of one part Portland cement and two (or three) parts sand.

Putty for Pointing.—To be composed of pure lime and clean, fresh water.

6. *Footings.*—To be built as shown on drawings, in English bond, with three or two projecting courses or double lower courses for 14in. (or 16in.) hollow walls.

7. *Air Bricks.*—Insert where shown (or directed) under all ground floors 9in. by 3in. (or 9in. by 6in.) terracotta or galvanised-iron air-bricks, and form and cement flues for same.

8. *Damp-Course.*—Lay at the proper level, as shown (or 6in. above the outside ground), throughout the full thickness of all the walls and jambs, a course of Claridge's Patent (or Seyssel) asphalte ½in. (or ¼in.) thick, applied hot and sanded over. Or—

   Lay over the surface of all walls their full thickness Doulton's (or Jennings's) improved glazed stone courses, with tongue and grooved joints and proper angle pieces bedded and jointed in cement mortar. Or—

   Lay over all walls, &c., a double course of stout Welsh slates, lapped at joints, bedded and jointed in wet cement ⅜in. thick, the course of brickwork above and below being built in cement mortar.

9. *Brickwork.*—Build the walls, piers, chimney stacks upon proper footings (as shown on sections) with the best hard burned London stocks (or other approved bricks carried up in English or Flemish bond) in lime (or gauged) mortar, to the several heights and thicknesses shown (or figured) on plans and sections.

   Carry up the walls in a uniform manner, in English (or Flemish bond), no one portion being allowed to rise more than 4ft. (or 5ft.) above another at one time. Flush up each course with mortar (or grout every fourth course with liquid mortar). No four courses to rise more than 1¼in. besides the height of the bricks (or the joints to be ⅜in. thick). All perpends and quoins to be kept strictly true and

square, and the whole to be bonded in accordance with the rules of good work. Or—

Bricks and Brickwork.—All bricks to be well-burnt and of a uniform size, of the best quality of their respective kinds. The external, main, and party-walls to be built with well-burnt stocks; the external walls (marked) to be faced with malms of approved quality. The internal walls to be built with rough stocks (or grizzles, or other approved bricks), and the footings and basements of rough stocks. Or—

Hollow Walls.—Build the external walls hollow in two thicknesses, 9in. brick on the inside (or outside), and 4½in. brick on the outside (or inside), with a cavity of 2½in. between, from where shown on section, or two courses below the damp-course to eaves level, and tie the two thicknesses together by wrought iron cramp 8in. by ¾in. by ¼in. (or by bonding bricks of Doulton or Jennings), six of these cramps being used to a yard super. (or spaced 3ft. apart alternately to every third course). The cavity and cramps to be kept clear of mortar droppings.

Over all door and window frames in hollow walls put 4lb. lead built into both thicknesses, and beyond lintels 4in. on each side, and turn down at ends.

10. *Sleeper Walls.*—Build sleeper walls 9in. (or 4½in.) in cement mortar, to carry ground floor joists where shown on section, not exceeding 5ft. apart, pigeon-holed for ventilation. Or—

The sleeper walls to be half-brick (or brick thick) with footings, with openings left every 4ft. Or—

Build 14in. piers 5ft. apart, with footings, on a bed of concrete 6in. thick.

11. *Fender Walls.*—Round all fireplaces on ground floor, build, with proper footings, fender walls one brick thick in cement mortar, and fill in space with cement concrete for stone hearths.

12. *Half-Brick Walls.*—Build all half-brick walls with a tier of iron hooping, tarred and sanded (where necessary), inserted every 5ft. in height, and the courses above and below built in cement. Or—

In cement mortar.

13. *Chimney Bars.*—Put to all fireplace openings 2½in. by ¾in. strong wrought-iron bars, caulked and turned up and down at each end 6in. into the brickwork.

14. *Bed and Point Frames.*—Bed and point in lime and hair mortar all door and window frames. The hair mortar to be 1 part lime, 3 parts sand, and 1lb. clean bullock's hair.

Generally.—Bed in mortar all beams, plates, lintels, stone sills, &c., and make good after carpenter, mason, &c. The brickwork to be well pinned and backed up to all stone (or terracotta work), and to be cut and fitted at the ends of all joists, iron girders, &c.

SANITARY WORK.—I.

PRACTICAL DETAILS.

Of late years much attention has rightly been given to the subject of house-drainage and sanitation, so that it is scarcely necessary to discuss anew the broad principles which are intimately connected therewith. The present purpose is rather to direct attention to a few matters of constructional detail which may prove useful in carrying out drainage works.

It is now an accepted axiom that all drains shall be laid in perfectly straight lines from point to point (any bend or change of direction being arranged within a properly-constructed inspection chamber), and as far as possible with self-cleansing gradients throughout. Adequate provision must also be made for the proper ventilation of each length of drain and soil-pipe, whilst at the same time taking due precautions to prevent the possible entry of vitiated air from the drains into the building. An intercepting trap is fixed at the junction of the house-drainage system with the public sewer, so as to prevent the escape of sewer air from the latter into the house-drains. The materials and joints of all drains must be such that when laid they shall be quite air and water-tight, so that no air or sewage may escape from the pipes other than at those points where provision is made for such purposes.

The nature of the ground in which the drains are laid should receive careful attention, and all necessary measures taken to insure a firm seating for the pipes: otherwise, settlements and fractures may result from an unstable or improper foundation.

When the bottom of the trench is formed in hard, unyielding ground, such as compact gravel and similar formations, the pipes are frequently laid directly thereon. In loose earth, wet clay, &c., where there may be a probability of the pipes sinking with the pressure of the superincumbent earth or from other local causes, a bed of Portland cement concrete should invariably be laid under the pipes, so as to provide an increased bearing surface.

For ordinary purposes the concrete is from 4in. to 6in. thick, and about 12in. wider than the internal diameter of the pipes to be laid. As a further precaution, the pipes are frequently well haunched up at the sides with concrete after the

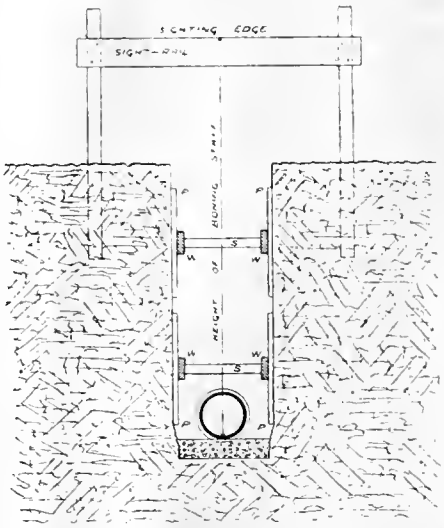


Fig. 1.

drains have been satisfactorily tested. By this means the resistance of the pipes to crushing or ultimate displacement is increased considerably, and further security provided against any chance of leakage in the drains themselves. Where very soft and treacherous ground is met with, it is desirable to use cast-iron drain-pipes, supported on stout creosoted fir piles driven sufficiently deep to insure a sufficiently stable foundation.

When excavating trenches in loose soil, proper shoring or timbering must be provided so as to prevent the sides from falling in. Fig. 1 illustrates the usual method of fixing the necessary strutting and planking. Short lengths of boarding (marked P P on sketch), about 3ft. long, and known as "poling boards," are placed vertically on each side of the excavation. These are held in position by means of a stout "waling piece" (W W) placed horizontally on each side of the trench, near the centre of the poling boards, the whole being firmly wedged against the standing earth with strong transverse horizontal "struts" (S), spaced about 6ft apart. As the excavation becomes deeper, another set of poling boards, walings, and struts are inserted below those previously fixed, until the requisite depth is

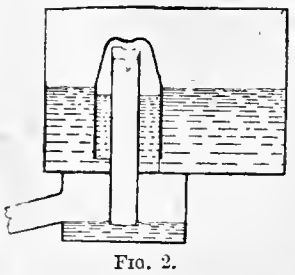

Fig. 2.

attained. Each set of poling boards, waling, and struts is technically known as a "frame," so that the illustration (Fig. 1) shows two "frames" of strutting and planking placed in position.

The poling boards are generally about 9in. wide, and from 1in. to 2in. thick, according to the nature of the ground to be supported. In very loose earth they are placed close together; but in comparatively firm ground they may be spaced from 2in. to 6in. apart.

The waling pieces consist of stout planks about 9in. wide, 3in. thick, and 12ft. to 14ft. long, whilst the struts are cut out of timbers varying from 4½in. by 3in. to 6in. by 6in. in section, according to the width of the trench and the nature of the excavation.

In Fig. 1 is also seen the elevation of a sight rail, the height of the boning staff used for laying the pipes to the desired gradient being indicated by the dotted line. Sometimes the sight-rails are limewhited or painted black, so that the sighting edge may be more easily distinguished from the surrounding objects.

Where the exigencies of the site do not admit of drains being laid to self-cleansing falls, it is desirable to provide an automatic flushing chamber arranged to discharge by siphonic action at regular intervals. A siphon in its most elementary form consists of a bent tube or pipe, having arms of unequal length. When the short arm is dipped into any liquid requiring to be discharged, and the internal air removed from the siphon, the atmospheric pressure within the tube is then less than that on the outside, so that the external pressure of the air, acting on the surface of the liquid, forces the fluid through the siphon, which thus passes up the short ascending arm round the crown or bend of the pipe, and escapes down the long arm.

In the construction of flushing chambers the principle of the ordinary siphon has been ingeniously adapted by different inventors so that the whole apparatus may be automatic in action.

Fig. 2 is an illustration showing the general arrangement of Mr. Rogers Field's automatic siphonic-action flushing cistern. The long descending arm is here represented by a vertical pipe, the upper end of which is covered by a shorter tube of larger diameter and closed at the top. This closed tube or cap represents the short descending arm of the siphon. The lower end of the descending arm is arranged to stand slightly below the level of the water contained within the "trapping box" beneath, whilst the upper end is formed with a projecting lip. When the tank is being filled, the water at the same time rises within the annular space between the long and short arm of the siphon, whilst the confined air is forced through the slight water seal of the trapping-box below. So soon as the level of the descending arm is reached, the water overflows and passes down inside; but owing to the projecting lip at this point it is prevented from trickling down the side of the pipe, so that it falls clear into the water-pool below, carrying with it small quantities of the confined air. As the internal air gradually becomes exhausted, the pressure within the siphon consequently becomes less than the atmospheric pressure outside, so that the water in the tank is forced through the siphon with great velocity.

To insure the proper working of the siphon it is necessary that the descending arm shall be placed truly vertical; otherwise the overflowing water—instead of dropping clear of the sides—will slowly trickle down the side of the pipe and run to waste, the siphonic discharge not taking place. When properly fixed, these flushing cisterns or chambers will act efficiently, even though they be only very slowly filled with water.

Where flushing tanks are designed to discharge their contents automatically at comparatively long intervals, the water supply must of necessity be a mere dribble. Instead of fixing the usual form of ball-valve, or a regulator valve which is arranged to admit an even and unvarying flow of water to the tank, it is desirable, where practicable, to provide a "reversible ball-valve," in which the action is exactly the reverse of the ordinary ball-valve. These are so constructed that the supply of water is a mere dribble when the tank is empty, but as soon as the cistern is almost filled the valve is opened and allows a full stream of water to enter, so that the action of the siphon takes place immediately.

Another well-known automatic siphonic action flushing arrangement, patented by Messrs. Adams and Co., is shown in Fig. 3. In this case the upper end of the descending arm is covered with a cap which corresponds to the ascending arm of the siphon, whilst the lower end is deeply trapped, the outlet of the trap being slightly contracted at C. When the flushing-chamber is empty, the level of the water-seal in the trap is shown by the dotted line B. As the water-level in the chamber rises, the confined air gradually forces out the water composing the seal of the trap, which escapes into the drain. This continues until the water-level within the descending arm reaches the point A, when the imprisoned air endeavours to escape round the lower bend. The compressed air, on passing up through the water-seal, is checked at the point C, but rises with sufficient force or impetus to carry a small quantity of water with it, thus destroying the equilibrium of pressure previously maintained within the tank and siphon. The excess of atmospheric pressure accordingly forces the water

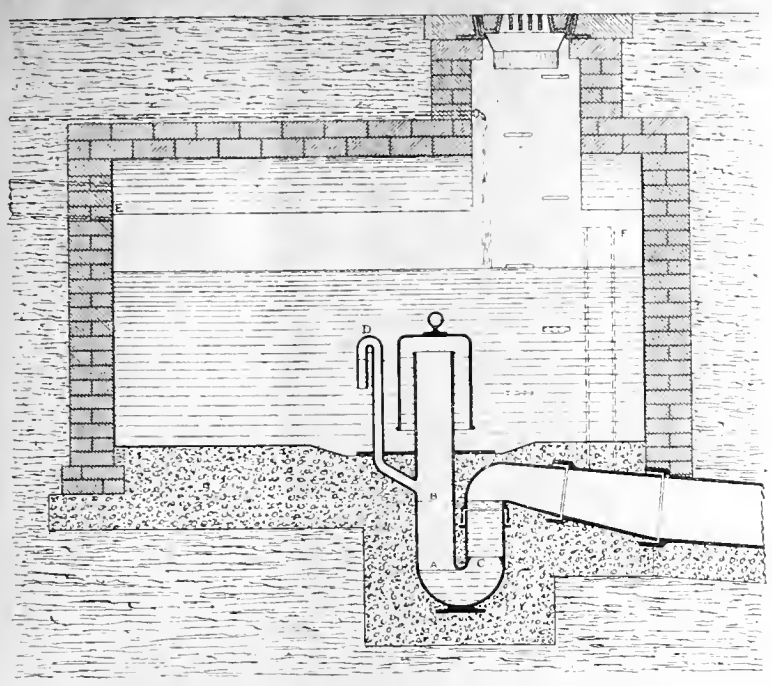

Fig. 3.

in the tank through the siphon, and the whole is rapidly discharged. A 1½in. diameter vent-pipe with bend (D) is provided just above the water-seal of the trap. This confines the requisite amount of air within the siphon, and is designed so as to prevent a partial vacuum occurring within the siphon after the discharge has taken place, thus insuring the water standing at the normal level (B) within the trap. The siphon may be set in action by the smallest dribble of water.

In some cases sewage or storm-water is used for flushing the main drains, one or more branch drains being arranged to discharge into the flushing chamber, as indicated at E in the illustration. An auxiliary vent-pipe (indicated at F by dotted lines) may also be provided if desired. This is useful as a means of ventilating the upper end of the drain, and is so fixed that when sewage, &c., is used for flushing purposes it may from time to time be removed so as to allow any

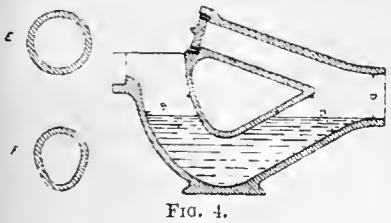

Fig. 4.

sediment at the bottom of the chamber to pass directly into the drain.

The thorough disconnection of the house-drains from the public sewer is another matter which must receive careful attention. An intercepting chamber, having a well-designed trap with a deep-water seal, should be constructed near the junction of the house-drain and the sewer. An air inlet for the continuous supply of fresh air to the drains discharging on the house side of the trap must also be provided.

The intercepting trap should be of a good self-cleansing type, with cascade inlet and a water seal of about 2in. or 3in. The cleaning eye of the trap should be fitted with a movable cap which can be readily removed and securely fixed without difficulty. Some of the best forms of intercepting trap are slightly contracted at the lower part of the trap, so that it may be more efficiently cleansed by the flow of sewage.

Another patented form of intercepting trap obtains the same self-cleansing effect by constructing the passage of the trap in an ovoid or egg-shaped section, as indicated in Fig 4. The inlet and outlet are of the usual cylindrical form shown at E, so that the trap may be properly connected to drain-pipes of ordinary section; but the intermediate portion is gradually diminished until the passage between B and C assumes the egg-shaped section shown at F. The passing sewage is, therefore, concentrated at this point, so that the water has a greater power to force the solid matters through the dip or seal of the trap.

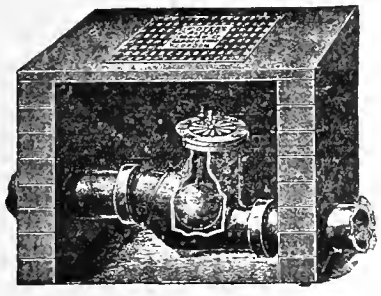

Fig. 5.

When the house drains discharge into a sewer which is subject to tidal influence, or liable to be flooded during very heavy storms, it is necessary to adopt measures for preventing the back-flow of sewage or water into the drains at such times. Some form of self-acting tide-flap or valve must therefore be provided near the outfall.

Fig. 5 is an illustration of Dyer's patent automatic tidal valve arranged within an inspection chamber. It consists of a hollow ball attached to a lever or rod so as to move freely at the slightest pressure. Under normal conditions the sphere remains suspended within the drain, and allows the unrestricted passage of sewage matters from the house to the sewer, but directly the sewage is headed back into the drain the pressure of the back-flow forces the sensitive ball against its seating on the pipe, and thus effectually seals or closes the house-drain until the pressure on the sewer side of the ball-valve is removed.

Fig. 6.

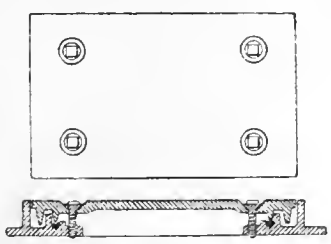

Fig. 7.

All inspection or intercepting chambers should be fitted with a strong iron cover. For house-drainage purposes, solid covers and frames are generally used, the entrance of fresh air to the drains being provided by means of a specially-constructed fresh-air inlet. Perforated covers, with dirt-box under—known as ventilating manhole covers—may be used for the admission of fresh air to the drains in suitable situations, but should not be placed near doors or windows, lest the ventilated drain become objectionable at any time, and so create a nuisance.

Numerous varieties of solid manhole covers are now obtainable. When selecting a cover for any particular purpose, it is necessary to take into

Fig. 8.

consideration the surroundings, and also the conditions under which it is to be fixed. Even when situated in the open air, and well away from inhabited buildings, the solid covers to intermediate manholes should be practically airtight, so that the air-currents between the properly-constituted fresh-air inlets and foul-air outlets of the drains may not be checked or disturbed in any way by the ingress or egress of air at other points. Where the manholes are necessarily in small areas or other confined situations, then not only should the covers be airtight for the reason mentioned, but it is essential—on the grounds of health—that they should be so arranged as to prevent the possibility of any escape of air or gases from the drain. Under such circumstances, particular attention should be given to the choice, and also the proper fixing of the frame and cover.

An efficient air-tight cover should be so designed as to be automatically sealed when closed, and at the same time the seal should not be liable to be broken in any way so long as the cover itself remains intact. It should also be strong, simple in construction, with few loose parts, easily fixed, and thoroughly secure against interference by mischievous or ignorant persons.

Figs. 6 and 7 are the plan and section of a single solid cover with a double joint. The inner groove of the frame is fitted with an indiarubber seal, whilst the outer grove may be filled with oil, glycerine, soft soap, or other suitable material. For additional security it is firmly fastened down by four gunmetal screws.

Double manhole covers should be fixed to all inspection chambers situated in confined places near the house, so that every safeguard may be provided against the escape of vitiated air from the drains.

Fig. 8 shows a section through a well-known patent double cover and frame for manholes. The inner cover is slightly arched, so that all moisture condensing on the under side runs down into

Fig. 10.

Fig. 9.

the adjacent groove. By this means an automatic water-seal is obtained. The inner cover is further secured by two locking bars (one at each end of the cover), so that it may be screwed down tightly into the groove. An air-tight joint is also provided to the outer cover by filling the groove with oil, glycerine, &c., thus affording an additional seal.

Lead soil-pipes should be connected to stone-ware drains by means of a strong brass tail-piece or ferrule (sometimes known as a "brass sleeve") passed over the end of the lead pipe and soldered thereto. The joint between the ferrule and the socket of the drain-pipe is then made good with neat cement.

The connection between the lead outlet of a water-closet and a cast-iron soil-pipe should be made in a somewhat similar manner, except that the joint is run with lead instead of being made good with cement. A brass ferrule is securely soldered to the lead outlet, which is then placed

in the socket of the iron pipe, and the joint run with lead and well caulked.

Fig. 9 is an illustration of a brass straight ferrule. They should be of the quality known as heavy cast brass, well finished in every respect, and not less than 3½in. long for pipes of small diameter, so as to allow sufficient space for making the wiped joint at one end and a caulked lead joint at the other.

The following table gives the approximate weights of ordinary brass straight ferrules and tail-pieces used in sanitary work, viz. :—

Approximate Weights of Brass Straight Ferrules and Tail-pieces.

Internal Diameter or Bore.	Length.	Weight.		
		Light.	Medium.	Heavy.
inches.	inches.	lb. oz.	lb. oz.	lb. oz.
1½...	3½	0 7	—	—
	3½	—	0 9	—

4½...	5	1 14	2 4	—
	6	—	—	3 2
	7	—	—	5 8

The connection between the earthenware outlet of a water-closet and the lead branch of a soil-pipe must be made by means of a stout brass socket or thimble. The socket is secured to the

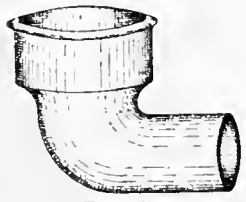

Fig. 10a.

lead pipe with a wiped solder joint. The closet outlet is then placed in the brass socket, and the joint carefully made with neat Portland cement.

The brass socket connection as ordinarily used is seen in Fig. 10, whilst Fig. 10a is a sketch of what is known as an elbow brass connection or

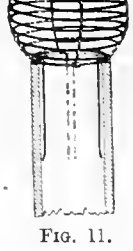

Fig. 11.

thimble. The approximate weights of ordinary brass thimbles or socket ferrules are as follows, viz. :—

Approximate Weights of Brass Thimbles or Socket Ferrules.

Internal Diameter or Bore.		Length.	Weight.	
Spigot End.	Socket End.		Medium.	Heavy.
inches.	inches.	inches.	lb. oz.	lb. oz.
2½	3	4	1 6	—
3	4½	4	—	2 6
3½.....	4½	4½	2 0	—
	4½	4½	—	2 10
	5½	4½	2 5	—
4½	4½	4½	2 7	3 0

Copper and gunmetal ferrules or thimbles are also sometimes used. It is most important that the connection between pipes of dissimilar materials should be made in the strongest and best possible manner. Neglect of such precautions might otherwise endanger the health of the occupants of the building.

The tops of all ventilating pipes should be fitted with a copper-wire grating or cage, so that the opening may not become blocked with birds' nests or falling leaves. Fig. 11 is a sketch showing the form of wire grating generally adopted.

ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Architectural Association was held at 9, Conduit-street, W., on Friday evening, the president, Mr. Hampden W. Pratt, F.R.I.B.A., in the chair. Two nominations for membership having been read, Messrs. A. T. J. Harris, of Croydon, and H. Wyllie, of Rochester, were elected as members. A vote of thanks was accorded to Mr. C. W. Stevens for permitting a visit to members to Claridge's Hotel, Bond-street, W., of which he is the architect, on Saturday, February 28th, Mr. E. Howley Sim, hon. secretary, remarking, in proposing the motion, that that building had proved a most interesting one.

Scottish Church Architecture of the Fourteenth and Fifteenth Centuries.*

A paper on this subject—illustrated by large scale plans, elevations, and details, some of which were taken from Messrs. Ross and McGibbons's recent work on "The Ecclesiastical Architecture of Scotland," others being contributed by students to the "Edinburgh A.A. Sketch-book," and others executed by the author—was read by Mr. Hippolyte J. Blanc, R.S.A., past president of the Edinburgh Architectural Association.

To attempt anything like a detailed or systematic examination of the church architecture of Scotland of the 14th and 15th centuries is not, he said, intended. The variety of detail those periods exhibit makes their study very interesting, but there is too much in them for one evening's review. I hope to satisfy you with a sketch of some of the most prominent examples, which may form leaders to much of like form and detail to be found in many smaller works, and to endeavour, as far as possible, to assist you in your knowledge of the English work of the same time, to compare, from the illustrations, the contemporaneous architecture in Scotland. One cannot pretend to be very accurate with regard to the precise dates of each and all of the examples selected, because of the special difficulty all students of Scottish work have experienced in chronologically placing works of those periods. This particular period of our church examples has been chosen because the church work of those centuries (and for that part the first half of the 16th century also), is

more distinctly Scottish

than can be said of the works of the centuries preceding. The most casual observer of church forms and details of the 11th and 12th centuries in France and in England will readily trace their genesis in the one country, and their acceptance and adoption in the other. During the early part of the Middle Ages, when, under the freshness of enthusiasm, Christian emigrants rapidly spread themselves all over Europe, Scotland also received the foreign influence, and readily accepted the progressive developments of architectural forms and details which the church-building fraternities brought with them. I do not suppose that anyone has contended that Scotland during that early period struck forth a style of her own, or even expressed then any very distinctive individuality in her treatment of churches: rather she adopted, under the guidance of her church patrons and founders, characteristics from both France and England. During the Romanesque, Norman, and First Pointed periods of church building, there is an evident parallelism in the works of France, England, and Scotland, even to the 13th century. In England church builders accepted the leading from France, while there are evidences of some individuality in treatment of details. In Scotland the French influence for long was strongest. In England the general proportions differed from those in France: English cathedrals of the 12th and 13th centuries are wider, but not so lofty as are those of the same era in France. In this matter Scotland appears to have followed more closely the French models. English work shows more restful consistency and stolidity, but seems to lack the rich grace and elevating continuity of forms—the emotion—of French examples. Whether Scotland in her works of that early time ever reached the great flights of skill and poetic expression witnessed in the French examples, we have perhaps lost the means of determining. Wherever, however, remains of her early works are found, there is enough to show that, while her buildings could not vie with those in England in respect of magnitude or richness, yet, as regards elegance of composition and expression of disciplined refinement of detail, the abbeys and cathedrals of Scotland can claim equal merit; they possess the same grace; they show the same skill in execution. Her church designers have exhibited equal ability and her artificers show themselves to have been equally capable with those of other countries during all periods up to the end of the 13th century. In Scotland

the buildings were fewer and of smaller dimensions.

Chronologically they are several years later than are the English examples, but in plan, general treatment, and in the order of development they do not differ much from their prototypes. As illustrative of the differences of dimensions of contemporaneous cathedrals in England and Scotland the following examples may serve :—

York	524ft. in length	St. Andrew's	358ft. in length.
Lincoln ...	482ft. ,,	Glasgow.....	283ft. ,,
Salisbury.	474ft. ,,	Elgin	282ft. ,,
Durham...	461ft. ,,	Kirkwall ...	218ft. ,,

Scotland's equal pace with England in the progress and expression of her church architecture is readily understood when we know that at this time the Norman barons, who, encouraged by David I., and tempted by extensive gifts of lands, spread and established themselves and their families all over the better parts of Scotland, following the great example of "that sair sanct for the Crown," founded bishoprics, and for centuries became patrons and superiors of bishops and also liberal founders of abbeys. Those noble Norman lords and knights carried with them from time to time, along with a love of war and the chase, a strong desire to foster the arts of peace, more especially in the form of church building. We find them liberally encouraging the Church in turn by gifts of lands, &c., in which such abbeys as Paisley and Melrose shared very largely. Parish churches also, as were required, were built by those barons, and were afterwards, by consent of the bishops, conferred in perpetuity upon the great monasteries and religious Houses of Regulars. The singular uniformity characterising the ecclesiastical buildings of the 12th and 13th centuries would seem to indicate that fraternities of church builders assisted in rearing the beautiful edifices found over Europe. Rickman reminds us that when Early Gothic was developed the whole western provinces of France were under the dominion of the English Crown, and that Normandy had been for a century or more part of the same kingdom. Thus Norman knights and churchmen would find ready access to England and Scotland, and carry with them the progressive development of church style. In many cases we know that monastic buildings in Scotland were subject to the rule of the French monasteries

* The following illustrations of the buildings described by Mr. Hippolyte J. Blanc have appeared in the pages of the Building News:—Aberdeen, Old-King's College Chapel, tower and crown spire, Feb. 23, 1872 (by J. Malcolm), and Dec. 31, 1897; stalls (measured drawings by P. Auld), April 1, 1870; St. Machar's Cathedral, western towers, Jan. 27, 1871; Costorphine Church (John Stewart), May 9, 1894; Dunblane Cathedral (perspective by J. B. Tyerman), July 24, 1885 (nave interior, by James B. Gibson) July 24, 1885; windows (E. F. C. Clarke), May 20, 1870; stalls (ditto), June 18, 1869; Dunfermline Abbey, plan of monastery buildings (the late E. C. Mackenzie Walcott), July 15, 1870; interior and north porch, April 14, 1893; section, April 3, 1896; Elgin Cathedral, east front (James B. Gibson), July 24, 1885; Glasgow Cathedral, perspective (Jas. Glen), April 26, 1884; Holyrood Chapel Royal, Edinburgh, April 10, 1896; arcading (J. Russell Walker), Jan. 28, 1870; capitals (ditto), March 18, 1870; Kirkwall Cathedral (section), April 3, 1896; Melrose Abbey, sketches (W. Canning), Jan. 21, 1881; measured drawings (Fred. J. Wass), February 5 and March 26, 1897; east end (John Begg), August 2, 1889; south transept (T. Lennox Watson), September 7, 1889, (John Begg), May 17, 1889; Midcalder Parish Church (Hippolyte J. Blanc), April 26, 1889; Paisley Abbey, measured drawings (T. Roger Kitsell), March 9, April 13, and June 22, 1888; Pluscarden Priory, measured drawings (Alex Macintosh), April 4 and August 1, 1890; Roslin Chapel, north and south sides, December 31, 1897; north door (from water-colour drawings by Patrick W. Adam), April 28, 1893; interior (J. B. Tyerman), July 24, 1885 (John Begg), April 12, 1889; ditto from photos, showing Lady Chapel and 'Prentice Pillar, Feb. 19, 1892; St. Andrew's, St. Salvator's Church, December 31, 1897; St. Monance, Fifeshire, plans and measured drawings (J. Russell Walker), March 20, 1891; sketches (John Begg), August 2, 1889; Stirling parish church interior, December 31, 1897.

from which the communities branched; but, as if anticipating Pope, who enjoins:—

Who builds a church to God and not to fame,
Should never mark the marble with his name,

the architects of those great cathedrals have not left any record of their names. If, as we assume, those buildings were the outcome of an aggregation of thought by fraternities, the explanation is apparent. There is no doubt that churchmen studied architecture, and were for the most part architects of their own buildings, being aided and counselled in matters of taste by the members of church-building fraternities already referred to. The

INFLUENCE OF ENGLAND

at this time upon our Scottish church architecture must have been likewise very important, because we know that the clergy who served in the Scottish churches were either priests from England or kinsmen of the Anglo-Norman founders born in Scotland. "Of the fifteen prelates who were elected to the primatial See of St. Andrew's during the 12th and 13th centuries, and designated themselves 'episcopi Scotorum,' not one appears to have been a Celtic Scot. Only a few sprang from the Anglo-Norman houses of Scotland, the great majority being Saxons and Normans from England." There must have been interchange besides, because we are informed that monks from Melrose became abbots of the Yorkshire monastery of Rievaulx, the parent house; Melrose also sent abbots to other Cistercian houses, including Kinross, Cupar, Newbattle, Deer, and Balmarino. Those warlike nobles, patrons of the Church, always in a state of preparedness for war, became the natural protectors of the unarmed monks, who thus enjoyed unmolested security in pursuing their building operations. The influence upon the country by the building of an abbey was great. A long period was usually required for the work, and during that time its members were continually in the midst of the practice of all the arts—painting, sculpture, and architecture, as well as of the ornamental hand works, for these were all practised together. The highest taste was thus cultivated, to be disseminated for the greatest good of the country. To these influences may be added zeal for religion, a high ideal, a generous rivalry between convents, and a desire to render the Church ritual magnificent—each and all of which gave impetus to church work in Scotland, and kept it full of vitality and abreast of the best work found elsewhere. The industrial and social life of Scotland up to the 13th century were likewise in a flourishing condition. The burgher and trading classes amassed great wealth, and gave generously of their lands and means to the Church. Scotland was thus a centre of intellectual cultivation, and enjoyed at this period more peace than fell to the lot of English monarchs. But all at once all these favourable conditions changed. By the sudden death of one of her most enlightened kings, Alexander III., in 1286, Scotland's lamp of prosperity and progress was unhappily extinguished, only to be rekindled after a long interval. The succession was now brought to open dispute. England essayed to adjust the matter by placing a king under vassalage to her. This was resented, and wars followed between England and Scotland, and it was only towards the close of the 14th century that Scotland began to show signs of returning restfulness and prosperity. The effect upon Scotland's architecture was disastrous. Scarcely any new buildings were undertaken, and by the wars many of the finest of those existing were greatly damaged. Her patrons—the wealthy nobles—had left the country, many to espouse the cause of England's kings, to whom, after the death of Alexander, they had sworn fealty. During that interval of strife—upwards of eighty years—England's church architecture had developed new features, passing out of the First Pointed to a new phase—the Decorated or Middle Pointed. But when

SCOTLAND RESUMED HER CHURCH BUILDING,

her schools of church builders had passed away; consequently, she had to go back, and, so to speak, reconnect the thread of architectural evolution from where she had left it in the 13th century. Even the monks had been cast adrift, to find elsewhere the help their homes could no longer afford. In the beginning few churches were built; but gradually, as returning prosperity increased, Scotland became alive to what she had lost in art, and in the 15th century she came forward with renewed vigour in the expression of a series of churches distinctively of native growth and development. The perfect First Pointed period, with its refinement and purity, its gracefully clustered shafts, lofty groined roofs, and elegant carvings was, in England, virtually obsolete. A style more massive had taken its place, the distinctive features of which were a greater exuberance of ornamentation, wider fenestration with elaborate cusped tracery, pinnacled buttresses, profusion of niches on walls and buttresses, &c. All these were matured, and were even passing out of English practice when Scotland commenced again her church work. England had actually entered upon her phase of the Perpendicular. France, with the buoyancy and vivacity of the race, rose out of her Decorated work into the flow of a restless form designated Flamboyant.

ECLECTIC ADAPTATION WITH ORIGINAL TREATMENT.

Along with the examples of First Pointed in her midst, Scotland had the association of the Decorated and Perpendicular of England and the Flamboyant of France, on which to draw for inspiration. The result is not an adoption of either, but a sort of adaptation of all, in which the work of the Decorated period predominates. Thus Scottish artists struggled bravely to regain for her a parallel place with England, and, though here and there comparatively unsuccessful, much of her Later work of the 15th century and of that entering upon the 16th century exhibits a return of the native talent for graceful expression and skilful execution. Of the contemporaneous works of England and France no doubt Scotland assimilated a good deal; but in all cases if would appear that she gave an independent character to the réchauffé. Thus her Perpendicular work, which is chiefly found at Melrose Abbey, with a scattered fragment here and there over the country, can scarcely be said to be merely a repetition of that in England. Moreover, with regard to the French influence of the Flamboyant of the same period, it will be found that Scottish examples really show very little of the actual forms of that period. The forms of window tracery, for instance, might be described as a transition between Decorated and Flamboyant. The construction is heavier, but the forms are more restrained than in the French examples, and are by no means inelegant. From a few examples of these on the screen we may be able to verify this. Of Decorated buildings there are few complete in Scotland, or executed while that style was in practice in England. The Decorated style, however, lingered very late in Scotland, examples being found up to about 1462. The later examples are not so successfully treated, however, the best work being found in Lincluden, Crossraguel, the nave of Glasgow, Elgin Chapter-house, Linlithgow, and part of Melrose. After the date named the work in Scotland became very mixed and degenerate, and under later influences began to show an infusion of the contemporaneous work of her Southern neighbours. During the centuries under review no cathedrals nor conventual churches were founded, yet many alterations and additions were made to those existing. To Glasgow Cathedral was added the upper part of the nave in the beginning of the 14th century, while the sacristy, the tower, and the south crypt were added in 1425 and 1500 respectively. In these is manifested the lingering attachment of the Scotch to earlier forms, all beautifully blended in a most interesting manner with details of a later period. But decaying piety and the comparatively diminished resources of the country brought about a reduction in the dimensions of her works. Hence we find, as fewer clergy were required, Scotland's chief works are the

COLLEGIATE CHURCHES AND CHAPELS,

of which nearly forty were founded in the 14th and 55th centuries. David Laing says there were thirty-six erected all over the country in the 15th and first half of the 16th centuries. They present in their detail nearly all that is characteristic of the period. Many of them no longer exist. They were built and endowed for a society of priests, commonly in a place having no episcopal see. The society consisted of a dean or provost, or other president, and, under them, prebends or canons who had in the church several degrees or stalls, where they sat for the more orderly singing of the canonical hours. They were instituted for performing divine service, for singing mass, vespers, &c., for the founders. They were divided into two kinds—one of Royal foundation, whereof the king was patron, conferred the prebends, named the provost or dean, and the canons or prebendaries: the other the foundation of barons, who, of their means, bequeathed grants to the Church for singing of Mass for the repose of the dead. Both in their services were regulated as in cathedrals, but were not under cathedral chapter control. Generally,

THE PLAN IS CRUCIFORM,

or intended to be so (because a great many have never been completed), and comprises a central, or sometimes a western, tower, a sacristy on the north side of the chancel, and a porch on the south side of the nave. There is but one example of a building with twin western towers—that of St. Machar's at Old Aberdeen. In one or two instances—as at St. Giles's, Edinburgh—there are chantry chapels, sometimes the addition of pious founders. Aisles are not common except in the largest of them. Roofs are plain, arched with ribs, but rarely groined. In one case—Roslin—the stone arch has no other external covering. In roof-treatment there are many very interesting and quite unique features. Over the vaulting is laid a series of overlapping and guttered blocks of stone in parallel squares, in some instances at very high pitch, and in others very nearly level, with but a slight elevation for water-run. This form of construction involved much difficulty in cases where transept or chapel roofs rose up upon the nave roof. In such cases, each section of the building was treated independently with gabled termination. This feature is met with all over Scotland, and seems specially a Scottish invention, being perhaps originally designed for her castles of much earlier date. It is not much met with in English work. The forms of most of the buildings of this period being chiefly aisleless structures, gave special prominence to the

WINDOWS.

These were large, and arch-headed, of two, three, and four lights. They were not lofty, however, evidently to avoid the necessity of cutting in upon the interior vaulting, and necessitating cross-vaulting with its more intricate construction. In England, even, we find that notwithstanding the greater richness their works express, the groined vaulting has given place to plain surface vaulting, but decorated with a superfluity of ribs which are merely ornamental. In the same way, while we have a few examples of good vaulting such as in the south crypt of Glasgow Cathedral, in Trinity College Church, Edinburgh, and in the collegiate churches at this period—ornamental ribs are here and there found applied to surface vaulting, merely to give distinction to the choir or other part of the interior of the building—such as the chancel at Seton Church. Other examples of this are at Melrose, and St. Mirren's aisle or Chapel, Paisley. In Linlithgow and Stirling Churches may be seen some interesting manifestations of ingenuity in overcoming the difficulties of vaulting over the apsidal terminations of the choirs. Fan vaulting is not found in Scotland. Roslin Chapel, already referred to (the plan of which resembles very closely the character of the choir at Glasgow Cathedral in its aisles and retro-choir), bears the simple pointed-arch vault. It is, however, profusely decorated with ribs rising from the main piers, and, on the fields between, with an exuberance of carving, quite unique. The side aisles are vaulted at right angles to the choir vaulting, and in this way a greater elevation than would otherwise have been available is obtained for the windows. This chapel was founded in 1446, and while bearing in its charter that it was built by workmen from foreign parts, it possesses all the evidences of being of home manufacture. The details in moulding are those found on other collegiate churches of the period. Its buttress-shaped quasi-porches are quite unique and thoroughly Scottish. For richness and interest in carved work it stands unequalled, if its small dimensions are considered, and in view of the fact that about this time (1446) French masons were numerous in Scotland, it is possible some were employed upon Roslin. This would explain the charter notice referred to. Each bay of the aisles is spanned by a pointed arch, springing from a richly-carved flat one, from which the relative vault springs. As formerly noted, while the Scottish churches of this period are designed to have nave, choir, and transepts, in many cases the nave has never been erected. A feature almost confined to Scotland at this time is the polygonal termination of the choir. It is to France, where it was very common, we must look

for the prototype, for in English work it is not found in the Late period, though Wells Cathedral possesses it. Of that form we have many examples, some showing externally merely a continuation of the main roof: others projected from the terminal gable of the choir as a bow-window. Of side chapels there are several: but they are either formed as quasi-transepts, or, as at Melrose, out of duplicating the south aisle of the nave in the same way as at Coutances. Elgin appears to have had chapels similarly constructed. Other features, such as sacristies and porches, are noticeable in the work of this period—two of the porches—namely, at Linlithgow and Aberdeen, being remarkable for the possession of an upper priest's chamber or parvise, with a turret stair conveniently placed to reach them. In doors of this period we have examples of the features of nearly all the preceding styles. But it is noticeable that the round arched form is found most frequently through all the periods of Scotch Gothic. In detail of moulding it, nevertheless, usually conforms to that of the style of the building to which it is attached. Of double or twin doors of the period, we have interesting examples at Haddington and also at Linlithgow, both of totally different character, and seemingly of different dates. Upon this

QUESTION OF DATES,

however, it is very difficult sometimes to trace the period of execution of the several parts from their mixed character. Defined as are the early periods, it cannot be said that the later are equally so. There is no line of demarcation marking the change from the Decorated to the Third Pointed in Scotland, such as one finds between the Decorative and Perpendicular in England; the movement is so gradual in Scotland. In external detail the Scotch Decorative period follows largely the suggestions of both England and France. Mouldings are, however, broader in treatment, and carving not generally so fine. There are many exceptions, however, and very often one comes across an interesting monument or sedilia, designed and carved with such richness as to be suggestive of French influence of later date. Of such we have excellent examples in Bishop Kennedy's tomb at St. Andrew's and elsewhere.

THE TOWERS

of the period are very interesting, though perhaps not elegant. Placed at the crossing of nave and choir, or at the west end, they are usually sturdy features of a great variety of form and finish. They are rarely at this period extended as spires, though the two at Aberdeen Cathedral have spires in rather stunted form. The most interesting form of termination of towers we possess is the crown, as at Aberdeen College and St. Giles's, Edinburgh. Two others—at St. Michael's, at Linlithgow, and at Haddington Abbey—existed on a smaller scale, but were thoughtlessly recommended to be taken down through an unwarrantable fear of their giving way. The origin of that feature has not been traced; but one example, somewhat more elegant than our Scotch examples, exists at Newcastle. It is in the windows, however, that we find the best expression of this period. There are many examples of pure Decorated work at the beginning; but as the 15th century progressed, the influence of the French Flamboyant manifests itself. The tracery is heavy, often clumsy, and in many characteristic examples the cusped foliations are wanting. Forms are likewise traceable to English examples of a much earlier period. Instances of Geometric design are found at Melrose, Dunkeld, Paisley, Tain, Crossraguel, and Torpichen, and the reticulated pattern is found at Dunfermline Refectory. There are few of the English Third Pointed or Perpendicular type. Melrose, perhaps, bears the nearest approach to it, while in a less degree are other examples at Stirling, Linlithgow, and Corstorphine. At Melrose the south transept window with its gable is rather a successful, and almost unique, example of the combination of Perpendicular, Flamboyant, and Decorated types. Of carved woodwork we have, unfortuoately, very little left us of the period. An easy prey to fire, it is scarcely to be expected that much would escape in the track of the wars of the 14th century. At Dunblane, however, we still possess a portion of the stalls, which is traced to be of late 15th century or early 16th century, and at Aberdeen and Tain respectively we have very characteristic pieces in a group of stalls and screen, and in a pulpit. The latter had become dismantled, and the carved parts scattered among the townspeople. They were, about 20 years ago, collected again, and reconstructed in the original form by the writer. The original pieces were nearly complete. Such, then, is a sketch of the outstanding distinctive features of Scotland's church architecture after the close of the 13th century—a sketch which it has been thought well should comprise the gradually diminishing few churches erected in the early part of the 16th century, prior to the Reformation. The last of these—a collegiate charge — was founded in 1545, and was scarcely finished when the Reformation became a completed act to turn the tide of church building into new channels. Perhaps it is as well something did happen in the cause of art. This dying specimen, debased, perhaps, in everything but in plan, bears evidence of a sad falling off in artistic qualities. It is a mere shadow, and a distorted one, of the many fine and characteristic details of preceding examples. But it seems as if it had become aware of its impotence, and so unpretendingly evolved a structure to meet certain requirements, heedless of its art value. I trust that in your review of the buildings described and illustrated I may be permitted to anticipate that you will, as I have done, recognise that in its work, Scotland has sustained the

RACIAL CHARACTERISTIC OF STURDY INDEPENDENCE,

though expressed sometimes at the expense of elegance. The English work of the same type, busy with many small members in mouldings, attenuated arcades supported on elegant but rather reduced shafts, does not seem to have appealed to the Scottish mind. The Scotch seem to have preferred the strength and solidity of their earlier works, continuing the cylindrical and polygonal shafts in arcades, even to a very late period, and in nearly every case they exhibit a mastery of the art of masonry construction quite commendable. It must be recognised that Scotland laboured under very special disadvantages from its prolonged internal disturbances. These severed her continuity of art study and culture, yet her work bears the impress of a vigorous effort having been made to regain her place in the art of church architecture. I do further anticipate, however, that, while her works may be judged as exhibiting an absence of the refinement shown in the works of her Southern neighbours, it must be remembered that in England and France political conditions were more favourable to an unbroken development of art. Where work of any magnitude had to be done in Scotland, however, the results (such as at Melrose) show that the intelligence and ability to apply appropriately and skilfully available architectural details, and at the same time to give the impress of her own independent mind upon them, had not entirely died out. Mr. Blanc further illustrated his address by showing on the screen over seventy lantern-slides of the principal churches described, including reproductions of plans and sections, and also photographs specially taken by himself. In this way the churches of St. Monance, Fifeshire; Dalkeith, Stirling, Seton (chapel), Trinity College, Edinburgh (now demolished); White Kirk College (chapel), Lady Kirk, King's College, Old Aberdeen; St. Michael's, Linlithgow; St. Giles, Edinburgh; St. Machar's, Aberdeen; Elgin, Glasgow, and Dunblane Cathedrals, Roslin Abbey, St. Salvator at St. Andrew's, and Haddington, Paisley, and Melrose Abbeys were vividly illustrated, and attention was called to the characteristic features—to the curious commingling of Flamboyant and Decorated detail, and the massive central mullion in the fenestration, the persistence of the round arch, the stone blocks used as roofing over a vault, the conical dwarf spires piercing the towers, and the polygonal east ends—in such a manner as to impress the peculiarities of Later Scottish work indelibly on the minds of all.

Mr. J. M. Bryden, in proposing a vote of thanks to the lecturer, remarked that it had been one of the most interesting papers read in that room, whether before the Institute or Association, for very many years. There was evidently a strong French feeling in all work executed north of the Tweed, especially in later times, some of which recalled the Late Gothic tracery at the Church of St. Eustace at Paris. Attention had not been called to the beautiful example of groined work to be seen at Dunfermline Abbey.

Mr. R. Phene Spiers, F.S.A., seconded the vote of thanks, observing that Scottish architecture was obviously original, and neither copied from English or French work. At Melrose Abbey the great beauty of the decorative carving was very noticeable. There seemed to be some foreign influence apparent in Roslin Chapel—either Spanish or Portuguese—but after carefully studying that building, which displayed an extraordinary originality and power, he had returned puzzled and dissatisfied with his analysis.

The motion was supported by Mr. Henry Lovegrove and Mr. Beresford Pite, the latter remarking that Mr. Blanc, in his criticism of the restoration of St. Giles's, Edinburgh, had lighted the funeral pyre of Mr. Burn; but from that office had come Norman Shaw and MacVicar Anderson. There was an obvious want of coherence in Scottish design throughout the Gothic period, and it was very doubtful whether the fenestration was derived from Norman or Spanish sources. He wondered where the idea of the Scottish crown spires was derived from, as it seemed altogether foreign to the spirit of the period, and country. There was an absence of finish in the carving; but this possibly might be due to the use of hard, coarse, and intractable stone. And when they recollected the eternal lack of pence and the hard times occasioned by the English, they must admit that the old Scottish designers did wonders.

Mr. Thomas Arnold said any foreign influence in Early Scottish architecture must have been French, and not English, as the Scotch were constantly at war with the Norman conquerors of England. He had never heard so lucid and interesting an account of the Later Scottish architecture.

The vote of thanks having been passed by acclamation, on the motion of the President, who observed that Roslin was still a puzzle, Mr. Blanc responded, remarking that he had taken some 500 photographs of Scottish churches, of which he had brought to London over 200 lantern slides, and he had spent the whole of that day in weeding these down to the absolutely essential 70 views to explain his subject. The influence of Scottish work on English architecture had been as potent as that of English work on Scotland. Even the crudest work of Scotland had, he claimed, a touch of the refinement, and even of poetry, which was well known to belong to the nation. He suggested that the Architectural Association should endeavour to arrange an excursion to Scotland, in conjunction with the kindred body at Edinburgh. He could promise them a hearty welcome, and the visit would be a mutual benefit, he believed, to the members of both Associations.

"THE BASIS OF DESIGN," BY WALTER CRANE.

THE last addition to the artistic library which Messrs. George Bell and Sons have produced is a handsome volume of lectures by Mr. Walter Crane on "The Basis of Design," * in which he endeavours, with no little success, to build up his thesis from the architectural root through "utility" and "material," which in turn are, of course, influenced by climatic and racial conditions, and find expression ultimately through such controlling limitations as "the symbolic," "the graphic," "the individual," and "the collective" impressions. One scarcely knows which to admire most in the character of Mr. Walter Crane, his wonderful facility of inventiveness in the patterning and scheming of decorative design, or his remarkable and sustained industry. Throughout, his work is undoubtedly mannered, and sometimes this mannerism seems detrimentally to domioate his productions in a regrettable way; but possibly this is inevitable in any case, and particularly where the producer evolves so much as Mr. Walter Crane, who has so masterful an individuality. His influence, therefore, as a teacher, cannot be confined to the comparatively limited sphere of the Manchester School of Art, where these lectures were originally delivered during the Directorship of Design held by him at that institution with so much *éclat*. Of these essays he says: "My main object has been to trace the vital veins and nerves of relationship in the arts of design, which, like the sap from the central stem, springing from connected and collective roots out of a common ground, sustain and unite in one organic whole the living tree." Thus the author's scheme is far-reaching enough for any man; indeed, he admits that every chapter

* The Basis of Design. By Walter Crane. London: George Bell and Sons, Covent Garden. 1898. 18s. nett.

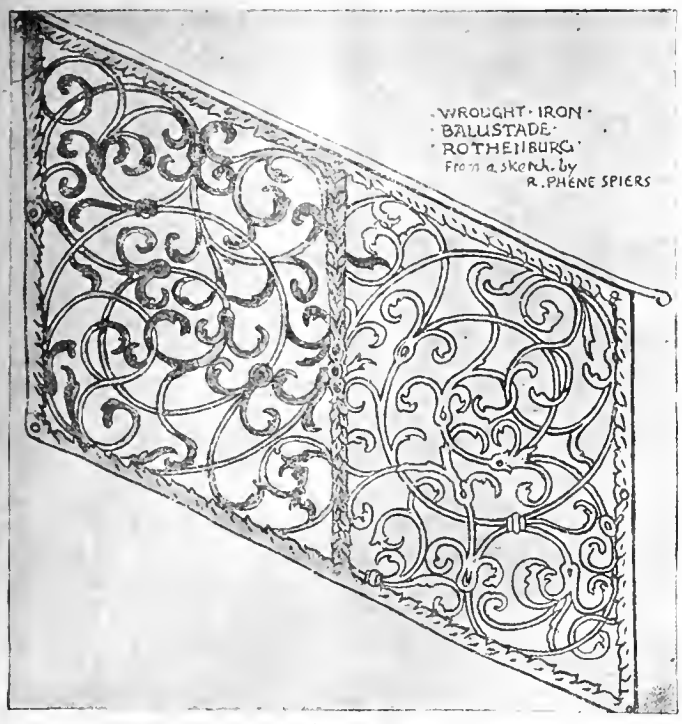

Fig. 1.

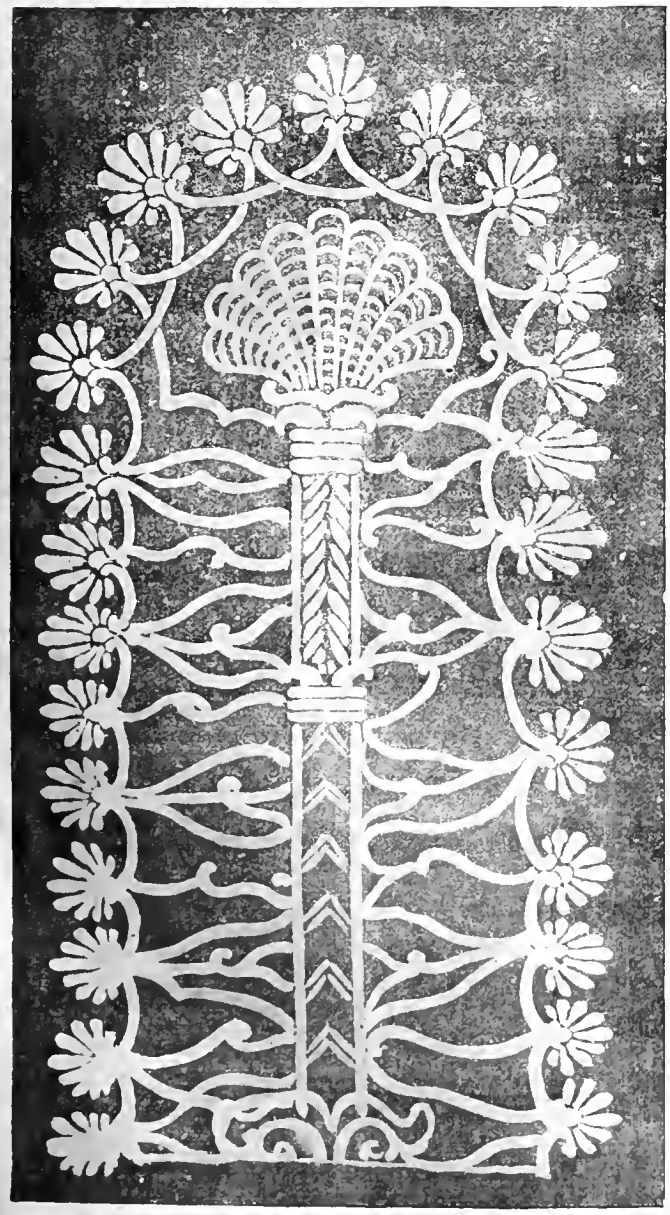

Fig. 6.

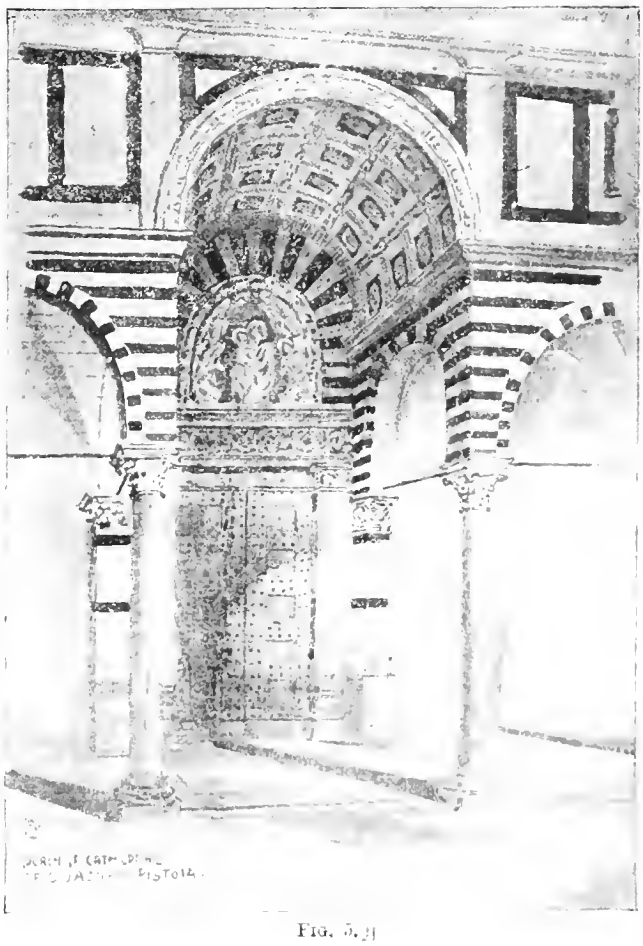

Fig. 5.

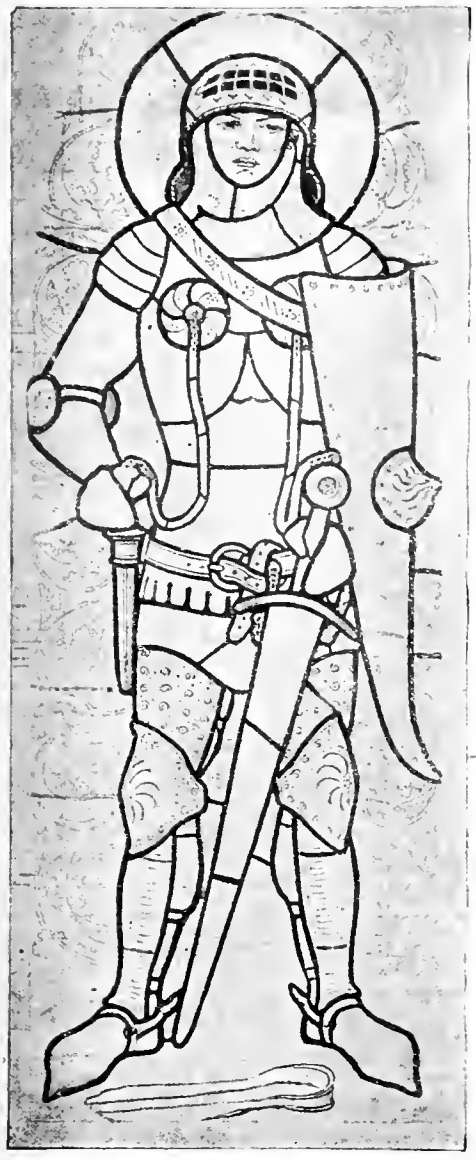

Fig. 3.

Fig. 4.

of his book might be expanded into a volume to secure for each section anything like an adequate treatment. But, after all, it is the suggestiveness of his writings which constitutes their value, giving enough, even where the touches on some branches of his subject are necessarily elementary, to set the student thinking, as he is started off in a right direction to work out for himself some of the problems connected with the art with which he has set himself the task of becoming acquainted, if not, in fact, to master. Mr. Crane begins at the beginning, and at the outset declares that the original and controlling fundamental principle of design is to be found "in Architecture, the Queen and Mother of all Arts," and so we are taken through the familiar development of architectural form and construction, the architecture of the round arch or dome, and the architecture of the pointed vault and buttress. The theme, of course, is not new—how could it be? but it is handled in an individual way, and that is what one wants, for, though Mr. Crane's method is by no means the strictly architectural way of treating the matter, the decorative side of the subject is never divorced unduly from the constructive. On the contrary, Mr. Crane insists again and again on the necessities of construction being utilised as the true base of a decorative feature and significant of its design. The construction, too, of decorative ornament, showing the relation and proportions of the masses in relief to the ground, is enlarged upon, as, for example, in the spacing of a metope of the Parthenon, which is treated upon in particular. The value of simplicity of line, the value of recurring and re-echoing forms, the value of figures in low relief, and the value of largeness of style in design are each in turn found emphasised in the first instance by the architecture of the Lintel, and in the Parthenon especially. As a matter of fact, however, throughout the history of the art the same lessons are to be found in the acknowledged types of the various styles, and even in the degraded periods, because as architecture deteriorated, it is manifest to even the casual observer that these values, of which we have spoken, are made conspicuous by their absence.

Mr. Crane, having taken his pupils through the styles in this manner, draws their attention to minor details, and directs their notice to furniture and articles of utility. Then the influence of material and method. This, by way of example, is illustrated through a study of wrought-iron work, as showing what ornamental effects can be gained by economy of means, the effectiveness of simply repeating well chosen curves, spirals, and lines, the whole being governed by the controlling spirit and period of the architecture of which it becomes a part. The flowing Renaissance scroll balustrade from Rothenburg, herewith illustrated, from a drawing by Mr. Phené Spiers, is a case in point, Fig. 1. Compare this with the altar screen from St. Thomas Church, Salisbury, Fig. 2. On glass design Mr. Crane has many useful things to say, and he gives several good illustrations. We are enabled to reproduce two, showing lead lines as the governing element, from cartoons by the late Ford Madox Brown, Figs. 3 and 4, which are in every way admirable.

The climatic influence and the essential difference of character as between the products of one country and another, are fittingly referred to. We associate, naturally, brilliant colours and bold designs with Eastern and Southern countries; but apart from the great stimulus of light which might encourage the use of vivid colour, broad and full sunlight has a curiously flattening effect upon colour and pattern, and, therefore, colours and patterns which, under a grey sky, would look staring or very strong and striking, under the sunlight fall into place and become subordinated to the dominant pitch of light. The porch of the cathedal at Pistoia, with its bold black and white bands of marble which face the front of this building, is given as an illustration which demonstrates this fact, Fig 5.

Of such indications of character and preferences generally traceable to *the race*, or mixture of the races from which a people have sprung, Mr. Walter Crane has much that is useful to say. We attribute certain imaginative faculties to our Celtic origin; certain calculating and analytical capacaties belong to Teutonic sources; while a mixed race, such as the Anglo-Saxon, is presumably distinguished by a marked practicality. These typical racial characteristics impress the art of a people, giving preference in colour, form, pattern, treatment, sentiment and idea, leaving a distinguishing mark upon the history of art, eloquent of the life of a nation, records of powers possibly long ago covered by the sands of time. It is difficult to disentangle these strictly racial characteristics entirely from other influences. Climate, habit, and local materials all help in its formation, yet a purely human element none the less real is discoverable, as clearly definable very often as the stamp of individual choice, as well as of the collective sentiment and climatic influence. The Egyptian hieroglyphics, their lotus flower; the ram and sun symbolising Amru-Ra, the king of all gods, the Assyrian trees and other forms are all distinctly definable, though the same ideas, and sometimes the same forms, reappear in Persian, Greek, Roman, and Renaissance work. The Assyrian Tree of Life (Fig. 6) became with them a formal piece of ornament constantly recurring in the art of all the Asiatic races, and was carried by them apparently, or from them, into Europe. So with other Early forms and ideas—they, too, often originating in a common source, gradually changed and became modified, as our author has in the volume before us in general terms skilfully indicated. For his chapter on Symbolism in Art and his account of Graphic Art we must refer the reader to these lectures themselves. They conclude, as we have already indicated, by some clever remarks upon Individual Influence and on Collectivism in Art, the collective experience of ages. And thus the book ends: "If we realise the close and necessary links that unite all workers, that are essential to the production of things useful or beautiful, or both, should we not do well to strive to make the association closer and more complete than it is, and thus hand on the lamp of good tradition in design and workmanship, however far we must look forward to the enlargement of our horizon and the harmonising of human life, and its freedom from the sinister powers and false ideals that now oppress and deceive it. And if we may accept the truth that art is unity, and that what the unit is the mass may become, should we not strive, each in his sphere, whatever our main work may be, to do it worthily and well? remembering that it is better to do a small thing well than a big thing badly, and that it is the spirit in which our work is done, not the place it may accidentally occupy, or the class to which it may belong, or the reward it may receive in the ordinary estimation, that makes it great or little." There is no more to be said; the author shall thus have the last word His book is well got up and nicely printed. The drawings are not uniformly equal in merit; lecture cartoons do not always make best book illustrations. The delineations of Gothic ornament are not among the most successful in the series, though they serve their purpose.

A sculptured monument has been erected in the south aisle of St. Michael's Church, Beer, South Devon, in memory of the late Miss Isabella Agnes Byles, of Whitecliff Glen. It has been executed in the studios of Messrs. Harry Hems and Sons, of Exeter, who carried out the whole of the carving and sculpture in the same church during the restoration, some 20 years ago.

At the meeting of the Monmouth Town Council held last week, a lengthy discussion took place regarding the cost of the new drainage scheme now being carried out by Messrs. Johnson Brothers. The original estimate by the engineer, Mr. Lailey, was about £12,000, and the original contract was £8,005. A report from Mr. Lailey before the board now estimated that it would take £16,432 to complete the work. The question of borrowing £10,000 more was adjourned, and it was decided to hold a special meeting on the 23rd inst., and invite Mr. Lailey to attend and explain.

ANGELS AT THE VATICAN, BY MICHAEL ANGELO.—NEW POST OFFICE, SUBERTON.—"THE PARADE," BOSCOMBE.—DESIGN FOR A SCREEN FOR A PRIVATE CHAPEL.—DESIGNS FOR VILLAGE, HAMLET, AND MOUNTAIN CHURCHES.—A SOMERSETSHIRE FONT AND PULPIT.

Our Illustrations.

FIGURES OF ANGELS FROM THE VATICAN, BY MICHAEL ANGELO.

THE angels of Michael Angelo are almost, without exception, wingless beings endowed with superhuman forms, striking in the boldness of their muscular attitudes, depending on vigour rather than aiming at an ideal angelic conception of the messengers of the Most High. Nevertheless they exemplify great imaginative and artistic power exhibited in the realisation of the grandness of form, though the tranquillity, serenity, beatitude, ethereal purity, and spiritual grace may be sought in vain in these masterpieces of Titanic art. The "Angel in the Annunciation," by Michael Angelo, is, perhaps, his single exception in the employment of wings. The followers of his school in its later phases degraded this earthly form of spiritual beings adopted by their great master, and they caricatured his ideals, rendering them at times extravagant and even sensual. Raffaelle stands alone in his sense of the aërial character of angels, though Rembrandt's works in this respect are of the highest degree of merit. Titian's angels are limited by a sense of glorified infancy. Correggio's angels are grand and lovely, while, elegant as the angels of Leonardo da Vinci unquestionably are, they seem to smile too much, and so fail in force of power, seldom entirely realising that knowledge of strength peculiar to the sons of God shouting for joy. As decorative groups, those which we reproduce to-day are too well known to need description. They embody this master's strongest characteristics in the sense which we have briefly indicated.

SUBERTON POST OFFICE.

THIS new Government building is fully illustrated by the accompanying plans and view, so as to need very little description. It is being built in red brick, with Bath stone dressings. The builder is Mr. G. H. Tucker, Caversham-road, Reading, and the architect is Mr. E. G. Rivers, of H.M. Office of Works.

"THE PARADE," BOSCOMBE.

THIS row of business premises, illustrated by the accompanying photograph, may be named among the extremely few buildings at Bournemouth which have any real architectural fitness or merit. Boscombe particularly is devoid of any buildings worthy of such a description. Mr. T. E. Collcutt's big hotel is, of course, a conspicuous exception, and in Bournemouth proper Street's grand Church of St. Peter gives the town a real character. Sedding's church, and another by Mr. Norman Shaw, help to redeem the monotony of the place, which, for the vulgar pretentiousness of its buildings, is scarcely surpassed, particularly some of the Nonconformist buildings in the town, on which no money seems to have been spared. "The Parade," Boscombe, has been built from the designs of Mr. Norman Wight, architect.

DESIGN FOR A SCREEN IN A PRIVATE CHAPEL.

THERE is a degree of freshness and richness of treatment in the accompanying Silver Medal design for a screen by Mr. James B. Fulton, which may be considered suggestive. The original drawing was washed over with a pale tint, which rendered its reproduction somewhat difficult, to the loss of some of its detail. It was crisply drawn, and the sculptures along the frieze were enlivened with gold and colour. The idea of the designer has been to adapt Late Perpendicular forms to modern uses.

"BUILDING NEWS" DESIGNING CLUB: A SMALL SUBURBAN CHURCH.

(FOR description and awards see p. 396.)

A SOMERSETSHIRE FONT AND PULPIT.

THE font, with its handsomely carved cover, is taken from Banwell Church, and is interesting, exhibiting, as it does, on the bowl, the use of seaweed as a means of ornamentation. The cover is of oak, octagonal in plan, terminating in a spire, with metal ring attached. Besides the font, there is a very richly carved and gilded rood-screen between the nave and chancel, the church itself being a good example of the characteristic Somersetshire Perpendicular type. The pulpit, which is from Huntspill Church, presents a sturdy and massive appearance, being of oak and decagonal in plan, three sides being omitted at the back to form the entrance. It will be noticed that each face, though of similar form, is differently treated as regards the carving, thus forming a rich variety. The letters forming the texts are left slightly projecting, the surrounding woodwork being picked out. The church itself has a lofty and spacious interior, and was partially destroyed by fire some years ago, but has since been restored. E. RODWAY.

It was reported to the Heywood Corporation at their last meeting that about half of the work in connection with the strengthening of the embankment of the higher reservoir in the Nayden Valley had been completed, and the cost up to date had been £6,080, exclusive of £4,008 for plant and material.

A new fire-brigade station has just been built at Hampton, Middlesex, by the urban district council. The architect is Mr. J. Kemp, A.M.I.C.E., the surveyor to the council. The building is in red brick, with Mansfield stone dressings, with elliptical arches and gables, and was erected by Messrs. Wright and Son, of Hampton.

Mr. G. W. Willcocks, M.Inst.C.E., Local Government Board inspector, held an inquiry at the town-hall, Maidstone, recently, with reference to the application of the corporation for sanction to borrow £1,023 for the construction of a new street and for street improvement.

Colonel W. R. Slacke held a Local Government Board inquiry at the town-hall, West Bromwich, last week, concerning the application of the town council for sanction to apply £3,500 of the balance of loan raised by them for works of sewerage and sewage disposal in defraying the cost of works of sewage disposal.

A new bank has just been built for Messrs. Stuckay in Regent-street, Kingswood, near Bristol. Messrs. Crisp and Oatley, of Clare-street, Bristol, are the architects, and Messrs. W. Cowlin and Son, of the same city, are the builders. The front is of Ham Hill stone.

Mr. H. H. Law, one of her Majesty's Local Government Board inspectors, held an inquiry at the Oswald Lodge, Woolston, near Southampton, on the 10th inst., into the subject matter of a petition to issue a provisional order to empower the rural district council of South Stoneham to put in force with reference to lands required by them for the disposal of the sewage of the parishes of St. Mary Extra, Sholing, and Bitterne, the powers of the Land Clauses Acts with respect to the purchase and taking of lands otherwise than by agreement.

Two new underground conveniences and lavatories have just been completed for the Shoreditch Vestry, the one in the High-street, and the other in New North-road. These conveniences are for both sexes, and have been constructed for the vestry, at a total cost of about £4,100, by Mr. George Jennings, sanitary engineer, of Lambeth, under the direction of the Works Committee and the surveyor, Mr. J. R. Dixon, A.M.I.C.E.

COMPETITIONS.

BARROW MUNICIPAL TECHNICAL AND ART INSTITUTE.—Acting on the advice of the assessor, Mr. Henry Lord, of Manchester, the committee of the Institute have awarded the first premium of £50 to the design submitted by Messrs. Woodhouse and Willoughby, of Manchester, and the second premium of £20 to Messrs. Wood and Hutchings, of Tunstall. The estimated cost of the structure is about £9,000.

CHIPS.

On Friday, the Woodnow district of Farsley, which has suffered for years in consequence of an insufficient supply of water, was coupled with the high-level service of the Bradford Corporation, who have carried out the work.

The partnership hitherto subsisting between L. A. Withall and E. H. Barton, architects and surveyors, Jewry House, Old Jewry, E.C., under the style of Latham A. Withall, has been dissolved.

In the House of Commons yesterday (Thursday) afternoon a Bill was introduced to enable the Government to commence building operations on the sites now being cleared in the vicinity of Whitehall and Parliament-street.

The ceremony of cutting the first sod of a new dock which is to be constructed at Llanelly was performed on Tuesday. The dock, which is to be nine acres in area, will be 1,000ft. long and 400ft. wide, with quayage of 1,200ft. It will be 17ft. deep on the sill, and the gates will be 50ft. wide. The total cost will be nearly £200,000.

At the Congregational Chapel, Highgate, N., an alabaster cenotaph with panel of white marble has been erected as a memorial of the late Rev. Josiah Viney, 1816-96. Above the panel rises a massive canopy, crocketed, terminating in a crisply carved finial. The memorial has been carried out by Messrs. Harry Hems and Sons, of Exeter, from designs by Mr. E. J. Paine, F.S.I., architect.

The Bill for incorporating the Brighton Underground Railway Company was to have been considered on Tuesday by a Select Committee of the House of Lords. At the meeting of the committee, it was announced that the promotors had decided to withdraw this scheme, which provided for the construction of an underground railway from Brighton railway station to the sea beach.

At the church of the Holy Innocents, Fallowfield, Manchester, on Sunday, the dedication of the Jubilee thank-offering took place. This thank-offering consists of a set of nine canopied stalls occupying the full width of the nave at the west end. In the back of each stall is a medallion carved in oak. The centre one contains the symbol of the Holy Innocents; the other eight the symbols of the Beatitudes.

The annual report of John Bazley White and Brothers (Limited) states that 1897 has been a year of improvement in the cement trade, both as regards prices and demand. The increase in the profits is due to decreased cost of manufacture and increased prices of sale. The amount of £89,057 is after deduction of £35,372, which sum includes all ordinary repairs and replacements, as well as the special outlay to repair the damage caused by the recent floods. After the deduction of debenture and mortgage interest, sinking fund, and dividend paid on the preference shares, there remains a balance of £47,973, out of which it is proposed to pay 4 per cent. on the ordinary share capital, to place £10,000 to reserve, and to carry forward £1,118.

By a disastrous fire, which occurred in November, 1896, the Valletort flour mills and warehouses at Plymouth, belonging to Messrs. Hosken, Trevithick, Polkinhorn, and Co., Limited, were entirely destroyed. Preparations were immediately made for rebuilding, and Messrs. Lethbridge and Sons, of Plymouth, were intrusted with the contract. The order for the machinery was placed with Messrs. Henry Simon and Co., Limited, of Manchester, milling engineers. Not only is the new building a larger structure, but its milling capacity is considerably greater.

Mr. J. S. Brodie, C.E., the engineer to the Whitehaven Harbour Commissioners, has reported to that body on the alterations necessary for the accommodation of the proposed daily service of steamers between Whitehaven and Ramsey. Mr. Brodie has prepared alternative plans for adopting either the north pier or the west pier as low-water landing berths. He estimates the provision of a north pier berth and dredging at £6,057 18s., north pier extensions at £8,178, and contingencies £738 2s., or a total of £15,514. The alternative scheme is, west pier berth and dredging, £3,345; north pier extension, £8,718; contingencies, £603; total, £12,666. Mr. Brodie strongly recommends the north pier scheme, and especially the extension of the north pier itself, which was part of the original scheme of Sir John Rennie.

"BUILDING NEWS" DESIGNING CLUB.

A SMALL SUBURBAN CHURCH.

A SMALL church for a hamlet on the outskirts of a town. The building to accommodate 300 and a choir of 24 voices. The site falls from W. to E. 10ft., and it is situate at the corner of two roads, with a south frontage of 160ft., and a depth of 100ft. to the second road, which runs N. There is to be a spire at the N.W. corner of the building, and the west entrance is to be through this tower, which will form a porch. There is also to be a south porch, and there may be transepts; but the building is not to be ornate, and it must be adapted to church requirements, and have a choir-vestry, as well as one for the priest. These need not be level with the church. The altar pace is to be seven steps above the nave floor, and the central passage-way up the nave is to be 8ft. wide. The organ must be near the chancel, and not be cramped in a recessed "organ-chamber," so as to impede the sound of the instrument gaining full vent. Material, coursed stone and wrought dressings. Style left to competitors. Roofs open-timbered, and covered with tiles. A pulpit and screen to choir to be shown. Scale, 8ft. to the inch for one main elevation and cross-section; other drawings may be 16ft. to the inch. Sketch view desirable. Cost will be taken into consideration; but no precise sum is fixed, though an estimate reckoned at a shilling per foot cube is to be furnished with each design.

These are the conditions which set out our requirements, and the two accompanying photo-lithographic drawings illustrate how our suggestions have been realised by the two architects whose plans were chosen for the first and second places. A block illustration of the third design is given with our letterpress. The first is by "Centaur," the second is by "Byd," and the third is by "Pantile." The last named is the most original; but we do not think his design is either attractive or suitable—in fact, it is crude and does not realise church requirements. "Centaur" works on regulation lines, though a strict ecclesiologist would not put a choir vestry under the sanctuary. The plan presents nothing very novel, and the external treatment hardly calls for much comment. There is good taste observable in the broad wall spaces and dignified simplicity of the elevations. "Byd," in a way, is rather similar, the transepts being, however made part of the choir rather than adjuncts to the nave. The interior we like better—indeed, the choice between these two is not very great, and not exactly easy to define. Some would no doubt prefer one to the other. The governing feeling in favour of the scheme placed first is that it is more like a village church in general idea, and it seems better as a whole. We have, perhaps, said enough about "Pantile's" design, which is rather American in type—at any rate, it is un-English. That is not a fatal fault; it is not enough, however, to be uncouth and queer, though we recognise the author's endeavour to give something out of the well-worn track. The course he has adopted, be it noted, would soon wear itself out, and this church, if built, would not weather well. Its regular coursed masonry is very out of keeping with the design. "Dacho" (who sends neither name nor address) comes next, chiefly on account of his elevation, for the plan is poor enough, with a heating chamber—of all things in the world—under the altar pace. The treatment externally is free, and the square-headed clerestory windows are ugly. "Thrums" is simple and is marked by a regulation air, with a squat Sussex-like tower, the walls of which are very thin. His tracery is Flamboyant, but weak. "Petticoats" does not understand church work, and his chancel is shockingly contrived. The view being somewhat spiritedly drawn attracts attention; but the whole thing is unreal and unsuitable. "Microbe" is very weak in a bold Lancet style which hardly calls for further comment. "Checkmate" conceives a hamlet church to look as if it were intended for St. John's Wood. He makes a feature of the narthex, or, in common English, the passage-way between two doorways, and here he locates the font. A nice draughty place for infants surely, particularly those who are baptised, in accordance with the Rubric, within eight days of their birth. This would be "Checkmate" with a vengeance. "Phantom" seems to believe in sloping buttresses, one of which he uses to shore up the relieving arch of his transept. His tower is very ugly. We really cannot specify all these designs; they are so poor. The church work of the future will be in a sorry way if the coming generation of architects cannot do better than these designs. They come as follows:—"Stone," "Tee-Square," "Olliwops" (no name or address), "Chuckle," "Hotspur," "Lany," "Gossip," "Derige," "Stanley," "Spark," "Gaiour" (*sic*), "Pick-Me-Up," "Bantam," "Erie," "Cobden," "Gib," "Hubert," "Oak," "Strax," "Tit-Bits," "R. W. P.," "Bernard," "E. G." "William the Englishman," and "Chess."

THE BROOK HOSPITAL.

AT Friday's meeting of the Metropolitan Asylums Board, an adjourned discussion took place on the report of the special committee in the matter of the Brook Hospital expenditure, which had exceeded the estimate by about £50,000. The committee had recommended the payment of the contractors' claims as finally adjusted by the architect, Mr. T. W. Aldwinckle, and the renewal of an application to the Local Government Board for an order authorising the further expenditure on loan, in respect of the erection and equipment of the hospital, of the sum of £100,000 in lieu of the sum of £75,000 applied for on Oct. 10, 1896. To this Mr. J. H. Brass had moved, as an amendment, "That the report be referred back to the committee for them to report as to the cause of the extra expenditure, as to the several contractors not executing the works in accordance with the sealed contracts, as to the power of the architect to order additional work without the authority of the board, and as to whether the certificates of the architect for such works are or are not *ultra vires*." Mr. Lile, in resuming the debate, attributed blame to the committee in allowing the architect to incur an extra expenditure of nearly £39,000 without reference to the committee; but did not think there was any evidence to show that if the whole of the items of extra expenditure had been brought before the committee the expense could have been in any way reduced.

Several members agreed that the board had a substantial building which was worth every shilling which had been spent upon it.

Mr. Purchese said the disclosures which had been made in connection with this matter were a gross scandal.

Mr. T. J. Robins asserted that the Brook Hospital Committee was as much to blame as the architect.

Mr. Edward White, the chairman of the committee of inquiry, expressed the opinion that the architect was largely to blame in not consulting the committee as to the extra expenditure.

The amendment was lost by 44 votes to five, and the recommendations of the committee were agreed to.

Mr. Lobb called attention to a letter written by the clerk to Mr J. Brown, a member of the board, in June, 1894, in which the hon. member was informed that a resolution passed by a sub-committee to the effect that certain bricks, of which Mr. Brown was the maker, might be supplied for use in the construction of the Brook Hospital, Shooter's-hill, in no way relieved Mr. Brown of the penalty which section 14 of the Metropolitan Poor Law Act of 1867 imposed upon the managers, and which might be recovered at the suit of any common informer. He said that in consequence of the receipt of that letter Mr. Brown requested the architect to omit all reference to the bricks in the specification; but, although that was done, certain bricks of which Mr. Brown was the maker had been used in the construction of the hospital. He moved "That the whole matter be referred to the Local Government Board to ascertain whether section 14 of the Metropolitan Poor Law Act, 1867, has been contravened by Mr. Brown in supplying bricks used in the erection of the Brook Hospital."

Mr. Willmott said a dishonest attack had been made upon Mr. Brown. The bricks manufactured by that gentleman were purchased by merchants and builders all over the country, and, amongst others, by a firm of merchants in London, who supplied a comparatively small number to the builders of the Brook Hospital. Mr. Brown had no control over the merchants or builders, and the only way in which he could prevent such an occurrence was to give up his business entirely.

The motion was lost by 26 to 5 votes.

OBITUARY.

THE death is announced of Professor Kirk, F.L.S., the well known botanist of New Zealand. Professor Kirk rendered valuable official service in connection with the Department of Woods and Forests. His "Forest Flora of New Zealand" is the standard work upon the forest growths native to the islands. Since the production of his principal work he has continued, from time to time, to publish monographs upon New Zealand timbers. A valuable report on the trees suitable for forest cultivation in the colony was issued by him in 1886, at which time he held the position of Conservator of State Forests in New Zealand, and he was engaged up to the moment of his death upon a great work devoted to the botany of Australasia.

CHIPS.

The Isolation Hospital, Belper, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke-flues, and Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The convalescent home at Dundee is about to be extended at a cost of £3,700, by the addition of two wings providing 34 more beds.

On Friday night the members of No. 3 Branch at Leicester of the Amalgamated Society of Carpenters and Joiners met at dinner at the De Montfort Hotel, Wellington-street, in that town, and subsequently presented Mr. E. Thomson with an illuminated address and a handsome marble clock and bronzes in recognition of seven years' services as secretary of the branch. Mr. J. Steer presided.

Lieut.-Colonel A. C. Smith, R.E., Local Government Board inspector, held an inquiry at Surbiton last week into an application by the urban district council for permission to borrow £6,000 for the erection of municipal offices, and £4,500 for the making-up of five roads at Tolworth under the Private Street Works Act, 1892.

The Lord Lieutenant of Ireland unveiled, on Leinster Lawn, Dublin, yesterday, a memorial statue to the late Sir Robert Stewart, the Irish composer. The statue, which is of Carrara marble, has been executed by Sir Thomas Farrell, P.R.H.A.

At their first meeting held on Tuesday, the London County Council accepted the gift of a new recreation ground, seven acres in extent, from the Earl of Northbrook and Viscount Baring at Bromley-road, Lee.

A select committee of the House of Lords decided on Tuesday, in the case of the Inner Temple (King's Bench Walk) Bill, under which powers were sought to build on reclaimed land now forming part of the Temple Gardens, that the preamble had not been proved. The Bill is consequently thrown out.

Four memorial stones were laid on Monday in connection with the enlargement and renovation of the Bethany Welsh Calvinistic Methodist Chapel, Lodge, Brymbo, near Wrexham. The chapel was built over 30 years ago, and has been completely renovated, and will now seat about 500. The total cost was £850. The builders were Messrs. Rogers and Son, Brymbo, and the architect was Mr. G. T. Williams, Liverpool.

The opening services in connection with the new Presbyterian Church, Blundellsands, were held on Sunday. The building has been erected at a cost of about £400, and is intended to provide accommodation for 200 persons.

The new list of members of the Society of Architects just published shows that there are on the roll 514 ordinary members, 17 honorary members, and 10 associates, giving a total of 541 in the three classes. At the corresponding period last year there were 518 members, 17 honorary members, and nine associates, in all, 544.

The South Shields town council have appointed Mr. S. E. Burgess, A.M.I.C.E., surveyor to the Stoke Newington Vestry, London, as borough engineer and surveyor at a commencing salary of £500, rising by annual increments of £25 to a maximum of £700.

A Local Government Board inquiry was held at Swanage last week by Mr. H. H. Law, C.E., respecting an application from the urban district council for sanction to borrow £8,500 for sewerage purposes.

The corporation of York, having applied to the Local Government Board for sanction to borrow certain sums of money for the purpose of carrying out the electric lighting of the city and other works, a public inquiry was held there on Friday before Colonel A. G. Durnford, R.E., inspector of the Local Government Board. The corporation seek power to borrow £23,000 for the sewerage works, £20,000 for the purpose of electric lighting, and £11,852 for street improvements.

PROFESSIONAL AND TRADE SOCIETIES.

The Auctioneers' Institute.—The first provincial meeting of the year of the Auctioneers' Institute of the United Kingdom was held on Friday at Oxford, and was largely attended. Mr. James F. Field, of London, the president, occupied the chair at the meeting of the council. A satisfactory report was received from the finance committee showing a balance in hand of nearly £500, and the benevolent fund showed a balance of £338. It was reported that a deputation from a meeting of bailiffs was received early in the year upon the subject of the law of distress and the present position of bailiffs, and it was resolved that it was desirable that a representative meeting of bailiffs should be held to thoroughly discuss the whole subject, and that the views of such meeting should be placed before a committee of the institute for consideration. Forty new members, 24 fellows, and 14 associates were elected. Mr. Alexander, of Cardiff, gave notice of a motion that the qualification for the election of a fellow should be amended, as it was considered by the South Wales branch that five years' practice as an auctioneer was not sufficient to admit anyone to this grade of membership. In the evening a banquet took place in the Municipal Buildings, when Mr. Field was supported by a numerous company.

The Edinburgh Architectural Association.—The members of this association met on Wednesday in last week in the Royal Institution, Mr. Thomas Ross, president, in the chair. Mr. A. Hunter Crawford delivered a lecture on "Steam Heating and Domestic Hot-Water Supply," illustrating his remarks by a plan, sketches, and a working model. The application of steam for domestic heating, cooking, and hot-water supply from one boiler was described, and the advantages and disadvantages of steam as a heating medium discussed, the lecturer expressing considerable doubt as to the advisableness of its introduction into this country to the same extent as employed in America, where the climatic conditions were so different. The flow of hot-water in pipes was then described, and the results of the experiments on the model given.——On Saturday afternoon the members visited Leith Academy, Leith Links, which has just been erected by the Leith School Board, Mr. George Craig, architect of the school, acting as leader. The company visited the infant classrooms, juvenile classrooms, art-rooms, lecture-hall, chemical laboratories, physical and technical laboratories, and other rooms for a science college, cookery and sewing-rooms. The school has accommodation for 2,097 pupils, and was built at a cost of about £30,000. The building is 122ft. long, and the height of the structure from the pavement to the top of the centre tower is 123ft. The style is Renaissance, with a centre wing and two side wings. The centre wing is one story higher than the rest of the school, which is four and a half stories in height. On the top of this story is a mansard roof, surmounted with a large flèche to be used as a ventilation outlet. The towers surmounting the other two wings are also to be used for ventilation. The heating and ventilation, which is on the plenum system, has been put in by Mr. Key, Glasgow, who explained to the company his method whereby filtered, washed, and warm air is impelled into every classroom, cloak-room, and corridor in sufficient volume to renew the whole air so many times per hour in summer and in winter. The members afterwards visited some of the few remaining buildings of historical interest in Leith, under the leadership of Mr. John Watson, architect. The town house of the Balmerino family, situated in a close off the Kirkgate, was first seen, then an interesting mansion-house in Quality-street; also the Old Custom House, dated 1727, on the Shore, and St. Ninian's Manse.

The Society of Architects and the Registration Question.—The council of the Society of Architects is desirous of obtaining the views of provincial architects upon the question of registration. They have, therefore, arranged to hold a series of meetings in the provinces, to which the best known architects who reside within a reasonable distance of the localities chosen will be invited. A meeting will be held at the library, Philosophical Hall, Park-row, Leeds, on Friday, March 25, at 7.30 p.m., Mr. Walter Emden, J.P., L.C.C., president of the society, in the chair. An address on "The Statutory Registration of the Profession" will be delivered by Mr. Ellis Marsland, hon. secretary, and a resolution approving of the principle of compulsory registration will be proposed by Mr. J. Wregitt Connon, F.R.I.B.A., of Leeds. This will be followed by a general discussion of the subject. In view of the Bill now before Parliament, it is eminently desirable to ascertain at once the attitude of provincial architects on this important subject. A similar meeting will be held at the Arts Club, Grainger-street, Newcastle-on-Tyne, on the following Monday evening, the 28th inst. The chair will be taken by Mr. Silvanus Trevail, F.R.I.B.A., vice-president, of Truro, and a resolution approving of the registration principle will be proposed by Mr. J. J. Lish, of Newcastle, past-president.

CHIPS.

The Council of King's College, London, have appointed Dr. W. J. Simpson, late Health Officer of Calcutta, to the Professorship of Hygiene.

The parish church of Honingham, Norfolk, has just been reopened, after restoration from plans by Mr. Herbert J. Green, of Norwich. The work includes refllooring and reseating, which have been carried out by Mr. Chapman, of Hanworth.

The twelfth county school erected in Glamorganshire under the Welsh Intermediate Education Act was opened at Gowerton on Saturday. The new buildings, which have cost nearly £5,000, afford accommodation for 120 pupils.

On Monday evening the new theatre connected with the training ship *Mercury*, lying in Hamble River, was opened. It has been designed by Mr. Romaine Walker, of London, after the Opera House in Bavaria. It is horseshoe in shape, and fitted with electric light, and is capable of seating about 600 persons. The orchestra, out of sight of the audience, is under the stage. The scenery is from the brush of Mr. Helmsley, of London.

A meeting of the Executive Restoration Committee for the Church of St. Bartholomew the Great, Smithfield, was held last week to celebrate the completion of the work of restoring this historic edifice, and the recovery of the portions so long alienated. Addresses of congratulation were presented to Mr. E. A. Webb, who has been churchwarden and treasurer throughout the whole period, and to his brother, Mr. Aston Webb, F.S.A., F.R.I.B.A., under whose directions, as architect, the works have been carried out by Messrs. W. Dove, Brothers, contractors, at a cost of about £31,000.

Mr. H. H. Law, Local Government Board inspector, held an inquiry at Carisbrooke *re* a dispute which has arisen between the Newport Town Council and Isle of Wight Rural District Council, as to the terms upon which the corporation are prepared to sanction the parish of Carisbrooke being connected with their sewerage system, and also upon the application of the rural district council to the Local Goverment Board for permission to borrow a sum of £2,000 for the purposes of the works of sewerage for the village of Carisbrooke.

A preliminary meeting of creditors in the matters of Michael Harmel and Myer Sayers, trading in copartnership as the South Main Street Furnishing Company, of Cork, also of Michael Harmel, Lombard-street, Dublin (on his own account), was held at Manchester, on Friday. The liabilities of the South Main Street Furnishing Company, which was only commeuced in February, 1897, amount to £2,356, and the total deficiency is £3,914. After a long discussion an offer of 7s. 6d. in the pound, payable within twelve months, was refused, and eventually it was agreed that unless 10s. in the pound was forthcoming, the matter should be wound up in bankruptcy.

The Southampton Corporation were informed at their last meeting that, on the iostructions of a committee, the borough engineer, Mr. W. B. G. Bennett, had reduced the estimated cost of the proposed muoicipal lodging-house from £14,500 to £10,000, the changes including the reduction in accommodation from 225 to 189 beds. After a prolonged discussion, and a division, the report was adopted, and Mr. J. F. Crook was appointed to take out the quantities for the building at a commission of 1½ per cent, preparatory to inviting tenders for the work.

The burial of the late Mr. Deputy James Edmeston, F.R.I.B.A., of 42, Old Broad-street, E.C., whose death we recorded in our last issue, took place at Brompton Cemetery on Thursday in last week, in the presence of a large gathering of relatives and friends. The principal mourners were Mrs. Hodges, Miss Edmeston, and Mrs. Dow (daughters), Dr. Dow, Mr. J. S. Edmeston, and Mr. J. Edmeston, jun. (grandsons). There were present also: Mr. E. Gabriel (the late Deputy's partner), Sir G. Harriss, Mr. P. Harris, Mr. H. H Collins, F.R.I.B.A., Mr. F. Stanley, C.C., Mr. E. C. Beedell, C.C., Mr. W. Brown, C.C., Lieut.-Colonel Thompson, C.C., and Mr. R. W. Edwards, C.C.

Building Intelligence.

Bordesley.—A new building, to be known as the Imperial Theatre, is to be at once erected on a site in High-street, at the junction of Clyde-street, and nearly opposite to the railway station. Plans have been prepared by Messrs. Owen and Ward, architects, of Birmingham. The stage will be 70ft. by 45ft, and the auditorium 70ft. by 65ft., and providing sitting accommodation for 2,700 persons. It is divided into orchestra and pit-stalls, pit, circle, and gallery, with six private boxes. There will be only two tiers above the pit level, and these are to be constructed on the cantilever principle. The principal entrances will be from the High-street into a hall 26ft. by 24ft., with a domed ceiling, and a marble staircase leading to the grand circle and balcony. The internal decorations will be in Louis XIV. style, the prevailing colours being turquoise-blue, cream, and gold. The external elevation will have a frontage of 100ft. in length, and will be of red brick with buff terracotta dressings, and an iron and glass verandah, supported on pillar-lamps, will span the footpath. The building, irrespective of fittings, is estimated to cost £12,000. The new theatre will be completed ready for opening by Christmas next.

Dunblane.—In consequence of the yearly increasing number of visitors to Dunblane Hydropathic, the proprietor has decided on extensive additions. A new wing will be added to the north end of the building, greatly enlarging the existing dining-room accommodation. The additions will afford room for nearly 100 persons, so that about 250 may sit down to dinner when the alteration has been carried out. In the basement underneath the new dining-room is a servants' hall and a servants' dormitory. Next year the symmetry of the frontage will be insured by the erection of a similar wing at the other end adjoining the present drawing-room. Plans for the extension have been prepared by Messrs. James M'Laren and Sons, architects, Dundee, while the contract for the mason work has been secured by Messrs. J. and C. Hay, builders, Dundee. The extension is to be completed in time to accommodate summer visitors.

It is announced that all applications for licenses for hoardings, scaffolds, shores, &c., upon or over the public-ways of the City of London, and for placards and advertisements upon the same, should for the future be made direct to the town clerk at the offices of the Public Health Department, Guildhall.

A vicarage house has lately been built at Weston, near Southampton. The building is a plain and solidly-built red brick structure, designed by Messrs. Mitchell and Gutteridge, architects, of Southampton, and executed by Mr. Rashley. It was opened on Monday in last week.

Very good business was done last week at the Auction Mart, among the notable features being the continued demand for freehold ground-rents at reasonable prices, and for building land in good positions. The aggregate realisation, as registered at the Estate Exchange, amounted to £165,354—a long way in advance of the corresponding week of last year, when the total recorded was £96,654.

The new Roman Catholic Church in Beverley was formally opened on Friday by the Bishop of Middlesbrough. The building is of stone, light being admitted by eight traceried windows, two of which, near the altar, are of stained glass. The pews are of pitch-pine, accommodating 200 worshippers. There is a gallery over the entrance for the organ and choir, and on the north side of the altar a small sanctuary and confessional.

At a meeting of the Lynn Town Council, on 9th inst., the resignation of Mr. E. J. Silcock, C.E., borough engineer, was accepted; but it was decided by the council to retain Mr. Silcock's services for the completion of the works for a new water supply to the town and new sewerage scheme which have been designed and commenced by him. We understand that Mr. Silcock has been appointed engineer to the King's Lynn Harbour Conservancy Board, and that he will also carry on a general practice as a civil engineer.

At a special meeting of Haddington Town Council, held on Friday, a report relative to the new bridge scheme was submitted by Messrs. Carfrae and Belfrage, C.E., Edinburgh. The engineers report in favour of the Market-street route, and estimate that a bridge, plans of which were produced, could be erected for the sum of £5,000, exclusive of approaches. The council agreed to ask the engineers to supply detailed figures regarding the various routes suggested.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

A. S. P. (We know few books on the subject to which you refer. If you apply to the Secretary of Institution of Surveyors, Savoy-street, for a copy of their examination syllabus, you will find a list of subjects, and we believe a list of textbooks for estate-surveying is given. The subjects you ought to study are those on estate management, law of landlord and tenant, dilapidations, land surveying, agricultural buildings and drainage, road-making, sanitary work. Get the "Handbook of House Property" by Tarbuck, Inwood's "Tables for Purchasing Estates, &c.," Wheeler's "Appraisers' and Estate Agents' Pocket Assistant" (Crosby Lockwood), and inquire of Batsford, 94, High Holborn, for books on any of these subjects.)

Received.—C. H. W.—O. V.—L. T. and Co.—N. P. G.—S. K. and Son.—D. C.

"BUILDING NEWS" DESIGNING CLUB.

Drawings Received. — "Bernard," "Petticoats," "Strax," "Ivy," "Dueas," "Olliwops," "Notts," "Pantile," "Alesia," "Tee-square," "Rydal," "Klondyke," "Centaur," "Cobden," "Giaour," "Crow," "Liny," "Derige," "Don't Know," "Hotspur," "Nowhere," "Cædmon," "Chess" (nearly a week late).

Intercommunication.

QUESTIONS.

[11914.]—**Regimental Colours.**—Can any reader advise as to how to preserve old regimental colours, which have suffered severely from being kept against the damp walls of a church? Is it possible to mount them on strong linen or fine canvas? Are there any firms who make a speciality of such work?—R. B. C.

[11915.]—**Rendering Lime Concrete with Cement.**—Lime, gravel, and sand are obtainable here at very low prices. The lime is a good quality, of very fat nature. I have built a flight of steps with lime concrete, and rendered it with cement, the result being not very satisfactory, which I ascribe to the amount of clay in the sand used in the cement rendering and the too small quantity of cement. I am told that cement will not hold to lime concrete, the two materials having no affinity, though I have often rendered a plain lime concrete floor with cement with satisfactory results. Will any readers oblige me with their opinion?—Australia.

[11916.]—**Dry and Wet Rot.**—Can any of your subscribers give me a good remedy for both dry rot and also wet rot with fungus growth, &c.?—Inquiaga.

[11917.]—**Brick and Timber Work.**—I shall be obliged if a practical reader will give a specification for a brick gable in which brick and timber framing are employed, stating the ordinary dimensions of the uprights and other timbers, thickness of wall, load, and other details of the corbelling over of the gable. The description will be useful to others beside myself.—A Country Builder.

[11918.]—**Witness to Building Agreement.**—Can any reader of the Building News inform me if, in the case of an ordinary building agreement between the owner and the contractor, the architect can sign the same as a valid witness to the signatures of the contracting parties, or whether the signature of an outside person as witness is preferable?—Lector.

[11919.]—**Hygeian Rock Building Composition.**—Will anyone give particulars as to how this composition can be applied to walls—whether it is best used between two walls, and what thickness, or as an outside or inside lining to cellar walls or storage tanks?—G. Williams.

[11920.]—**Hollow Wall Ties.**—A friend is thinking of building a house with hollow walls. What is the strongest and best form of iron tie, and the name it is known by? I think the stoneware brick gives more opportunity for the moisture to pass through, as it affords a better lodgment for mortar droppings. I shall be glad of any practical advice, the distance the ties should be placed, size of cavity, &c.—Damp-Proof.

[11921.]—**Facing Bricks.**—What bricks are recommended for the front of a house in a West-end street? They must be good, hard, and of deep colour, though absolute uniformity of tint is not desired.—L. O.

REPLIES.

[11909.]—**Silicate Cotton.**—Replying to "W. H., Manchester," in your issue of 4th inst., the fault of his method of applying the silicate cotton sheets is that he failed to secure entire insulation by leaving the joists free to conduct the sound. Complete insulation is essential to complete success, and this is obtained by fixing the "sheets" underneath the joists, say from centre to centre of each alternate joist. Fillets can then be fixed to carry the laths for the ceiling, or, better still, Jones's patent combined silicate cotton and plaster slabs can be used, thus economically combining the silicate cotton sheets and the plaster ceiling in one process.—M. H.

[11911.]—**Bending Moment.**—In mechanics a "moment," or "moment of a force," about a point is said to be its tendency to produce rotation about that point. We speak of the moment of a lever about the fulcrum, of the handle of a pump, the rotating effect being measured by the distance of the force from the axis of rotation. The "bending moment" of a beam is the load relatively to the cross-section, or the weight acting to bend the beam effectively. If we suppose a cantilever beam with the weight applied at the free end, the bending moment is $w \cdot x$, w representing the weight, and x the distance of weight from the fulcrum, the strain or moment being proportional to the distance. In other words, the "bending moment" of a beam has been defined as follows:—"The bending moment at any point in a beam is the algebraic sum of the moments with respect to that point of all the external forces acting on the portion of the beam on either side of that point," and the amount of the moment can be determined graphically, as shown in all treatises on mechanics.—G. H. G.

[11912.]—**Painting Galvanised Iron.**—White-lead unquestionably sets up a galvanic action on the iron, and is not recommended. For toughness and adhesive qualities, iron oxide paint with pure oil is no doubt one of the best coverings for iron. Considerable experience in the painting of iron structures in America proves the value of oxide of iron paint to corrugated roofs, especially when the metal has been scraped clean. The subject has lately been discussed in the columns of the Building News, and I think "C. F. M." will find some useful remarks on the subject by referring to two or three of the last volumes.—G. H.

CHIPS.

An alabaster tablet has been erected in Durham Cathedral by the family of the late Dr. Maltby (1770-1859) in memory of the deceased prelate, who was Bishop of Chichester from 1831 to 1836, and Bishop of Durham from that year till 1856. It is placed in the north transept, and bears an inscription, surmounted by the Episcopal arms.

Mr. W. Y. Macgregor and Mr. W. S. Macgeorge, painters, were elected to the rank of Associate at a general assembly of the Royal Scottish Academy on Wednesday.

Decorations, designed by Mr. Aston Webb, have just been completed at St. John's, Notting Hill. The colour scheme is green, red, and yellow, sparsely relieved with gold—all kept in a light key, as the chancel is a dark one. The greatest elaboration has been reserved for the east wall. On either side of the east window are painted full-length figures of St. John and the Blessed Virgin. The general wall faces of the chancel are diapered with pomegranates and bluebells, emblems of St. John. Above the arch is the Dove, and on either side two censing angels (9ft. high). The ornament generally is designed in a Late character, the emblematic grape and vine-leaf being mainly used.

The national harbour works at Dover have been commenced this week by the inclosure of an area of foreshore between the Admiralty Pier and Shakespeare Cliff at the western end of the town. The inclosure will be used for the purpose of making the concrete blocks for the extension of the Admiralty Pier section of the work, which is to be continued to a distance of 4,000ft. into the sea.

LEGAL INTELLIGENCE.

Public Building District Surveyors' Fees. —London Building Act, 1894.—Dicksee v. Bullers.—At Southwark Police Court on March 14, Mr. Fenwick gave his decision in this case. The plaintiff, Mr. Bernard Dicksee, district surveyor for East Newington, summoned Mr. J. Bullers, the builder employed, for £7 17s. 6d., district surveyor's fees, in respect of certain alterations made to St. Matthew's Church, New Kent-road. The case was heard on January 26, when evidence was given by the plaintiff that the work done consisted of removing the old chancel floor, and erecting a new chancel floor supported on dwarf walls at a higher level than the old floor, and extending some 9ft. further into the body of the church, several pews being removed to make room for this. The new floor had seven steps up to the altar, instead of the previously existing three steps. There was no alteration to the walls or columns of the church, except that the bases of the small attached columns at the east end were taken out and refixed at a higher level. No building notice was in the first instance given by the defendant, though one was subsequently given when demanded by the district surveyor. The district surveyor surveyed the work from time to time until completion, when he issued his certificate under Sec. 78. When, however, a demand was made for the fees, defendant wrote to the plaintiff that he was instructed by the owners not to pay. It was contended by the district surveyor, who appeared in person, that the work done came within Secs. 78 and 80, brought into operation by Secs. 207 and 209, and that the work must be done as approved by him. It was argued by counsel for defendant that the Act did not apply in this case, and the case of "Venner v. McDonell" was quoted. Mr. Fenwick, in giving his decision, said that he had come to the conclusion that the correct reading of the Act was that for the Act to apply the work done must be "work affecting, or likely to affect, the building," as stated in the latter part of Sec. 78. It therefore only remained for him to decide as a fact whether the work done was of such a character. For explanation he must refer to the earlier part of the section which read that "Every public building, including walls, roofs, floors, galleries, and staircases shall be constructed in such a manner as may be approved by the district surveyor." The question was, therefore, Was this work such as affected the construction of the church? He had heard the evidence and made a personal inspection of the building, and he had further an excellent plan of the alterations to guide him, and he could come to no other conclusion than that it did—therefore, the district surveyor was entitled to the fees. Addressing the plaintiff, the magistrate asked whether, having regard to his (plaintiff's) previous offer to accept less, he was still disposed to do so, and asked what amount was suggested. Plaintiff stated that no amount had been mentioned, and he would prefer to leave the matter entirely in the magistrate's hands. Upon the magistrate pressing the plaintiff for his view of the amount, he suggested one-half. The order was therefore made for £3 18s. 9d., and 3s. costs.

Alterations are being made at the Corn Exchange, Melton Mowbray, embracing the ventilation, which is now carried out on the Boyle system.

In the House of Commons on Wednesday, a Bill, introduced by Sir Elliott Lees, to prevent the removal of monuments which have been erected in cathedrals or churches out of public money in pursuance of a vote by Parliament, was read a first time.

In the north transept of Ely Cathedral there are two recessed bays of Abbot Simeon's original work, the finest examples of Early Norman in this country. The recess nearest the choir is known as Northwold's Chapel, and within this a work in alabaster is now being erected, consisting of a reredos and altar. Beneath a pierced canopy are figures—in the centre the Saviour, on either side an angel bearing a censer, and below these six angels in prayerful pose. The idea of a place for private prayer is due to a Canon, at whose cost it will be carried out. It will be dedicated to St. Edmund, King of East Anglia.

The parish church of Falmouth was reopened last week by the Bishop of Truro after reconstruction. The unsightly old roofs have been remodelled on an elaborate scale. The huge north and south galleries have been removed, a west gallery has been retained but rearranged, the dilapidated pewing removed, and new seating has been substituted. The old floor (which was composed of patches of woodwork, and large iron gratings, and loose stone slabs and tiles) was taken up, the numerous vaults filled in, and a new floor laid down with wood blocks, under the seating. The scheme for the alterations includes a new apse and a new north tower; but only the first portions of Mr. Edmund Sedding's plans have been carried out, for want of funds. Over £3,000 has been expended on these improvements.

WATER SUPPLY AND SANITARY MATTERS.

The London Water Supply.—At Monday's sitting of the Royal Commission on the Metropolitan water supply, Mr. W. H. Dickinson, chairman of the water committee of the late London County Council, was recalled and cross-examined by Lord R. Cecil for the Hertfordshire County Council, and said the policy of the Council with regard to the outside areas was to hand over to them entirely the distribution, and a proportionate share of the right to draw water from the Thames according to the number of consumers. The witness expressed a decided preference for a policy of purchase rather than one of administrative control. Sir John Lubbock, M.P., said that in his opinion the purchase by the London County Council of the undertakings of the eight water companies would not be expedient in the interests of London, either as regarded the purity of the water supply or from a financial point of view. He cited figures to show that purchase would involve increased cost to the ratepayers. Neither Government nor municipal management could be expected to compete with private management in economy or efficiency, and was only defensible in special cases. He doubted whether the tendency of public opinion was really in favour of placing the water supply in the hands of the County Council; and it was undesirable on several grounds that the governing body of the Metropolis should be a gigantic employer of labour. In preference to a policy of purchase he advocated a control with representatives of the ratepayers on the board of each company. By such an arrangement the advantages of purchase would be secured, and its dangers avoided.

Royal Commission on the Sewage Question.—The Royal Commission about to be appointed to consider the various phases of the sewage question will be a small body, consisting, in all probability, of seven members. The chairman will be supported by a chemist, a bacteriologist, a couple of engineering experts familiar with the different methods of urban drainage, and probably two Local Government Board officials specially qualified to speak with authority upon sewage matters.

Water-borne Typhoid.—At the Sanitary Institute on Wednesday night in last week a paper was read by Dr. Childs, of University College, on water-borne typhoid. After reviewing the various causes of typhoid fever, he pointed out that the protection of water supplies was the one measure calling for immediate action. The present law was quite inadequate. The first requirement was the thorough and systematic inspection of the water supplies from source to distribution; but the duty of taking action was thrown on the sanitary authorities who had only enabling, not compulsory, powers, and were themselves often the greatest polluters. The chief obstacle to reform was the ignorance and indifference of the public. He concluded by recommending (1) that sanitary authorities should have free access to water supplies, and should provide for their inspection and analysis; (2) that water companies should publish full information as to their water; (3) that they should be required to make regular inspections and analyses, and publish the reports; (4) that they should be made responsible for the consequences of pollution; (5) that wilful pollution of water should be a penal offence; (6) that public authorities should be appointed for the care and protection of watersheds. A discussion followed. Dr. Sims Woodhead drew attention to the vitality of the typhoid bacillus in soil, and the consequent need of preventing soil pollution. He suggested that sanitary authorities should have rights of supervision over water companies, and that the responsibility for pronouncing on the sufficiency of the water should fall upon them. The whole question should be placed under the control of a central board. Major Flower, engineer to the Lea Conservancy Board, advocated individual action in getting rid of river pollution. Dr. Louis Parkes thought the protection of watersheds might very well be intrusted to county councils. Dr. Childs, in reply, laid stress on the primary necessity of diffusing knowledge among the people.

A destructive fire broke out on Friday night in St. Edmund's Roman Catholic Church, Walkden Moor, Walkden, resulting in the complete gutting of the building, which was of pitch-pine, covered with felt and galvanised iron. The fire originated through a leakage of gas in the vestry. The damage amounts to over £1,000. The whole of the church furniture, including a valuable organ, was destroyed.

An important inquiry was opened in the Withington Town Hall, on Friday, by W. W. E. Fletcher, an inspector of the Local Government Board, into an application made by the Withington Urban District Council for sanction to borrow £5,500 for the purchase of Baguley Lodge Estate, 4½ miles from Withington town hall, as a site for an Infectious Diseases Hospital. Mr. Mountain, surveyor to the urban district council, explained the scheme.

PARLIAMENTARY NOTES.

The Architects' Registration Bill.—In the House of Commons on Wednesday, Mr. Ll. Atherley-Jones brought in the Bill to provide for the Registration of Architects. The measure was read a first time.

CHIPS.

The 20th annual dinner of the Builders' Clerks' Benevolent Institution will be held on Tuesday, April 5, at the King's Hall, Holborn Restaurant, when Mr. R. C. Foster, of Rugby (Foster and Dicksee), the President, will occupy the chair.

Messrs. Warner and Son, of Cripplegate, have now completed the recasting of the old church bells at Sevenoaks. They have been rehung in the belfry, and will be rung for the first time on Sunday.

The Hotel Victoria, at Newmarket, which has been erected from designs by Mr. Walter Emden, P.S.A., was opened yesterday (Thursday). The building, the architecture of which is of the Flemish character, stands on the site of the old Greyhound, in the High-street. The entire furnishing of the establishment has been carried out by Messrs. Maple and Co.

Messrs. Balwin-Latham, C.E., and W. J. Dibdin, F.I.C., have prepared a scheme for the purification of the sewage of Ashton-under-Lyne, by the bacteria process.

The East window of the church of St. Michael at St. Albans, lighting the famous effigy of Lord Bacon in the chancel, has just been filled with stained glass, at the cost of the Earl of Verulam. The window, of three lights, has as its subject the Transfiguration. Our Lord occupies the central light, and on either side are figures of Moses and Elijah; while underneath are the three apostles Peter, James, and John.

In the Court of Appeal, on Friday, before the Master of the Rolls and Lords Justices Rigby and Vaughan Williams, judgment was given in an appeal, "The Overseers of Worthing v. the Surveyor of Taxes," from the judgment of a Divisional Court. The question at issue was whether glass-houses in or on a market garden were to be rated as buildings or as agricultural land under the Agricultural Rates Act, 1896. A Divisional Court had decided that the buildings were to be treated as part of the market garden, and rated as such. The surveyor of taxes appealed, and their Lordships now by a majority (Lord Justice Williams dissenting) allowed the appeal, with costs in that court and below, holding that the buildings must be rated as such, and not as agricultural land.

The ceremony of opening the new Wesleyan Sunday-schools, erected in connection with the Coltman-street Church, Great Thornton-street circuit, Hull, was performed on Friday afternoon. Some £3,500 has been expended on the new premises. The central hall will accommodate about 800 children; but there are in addition 17 class-rooms and other dormitories.

A decorator and grainer, named Jinks, 56 years of age, was, in the Queen's Bench Division on Friday, awarded £500 damages against Messrs. Lawrence and Sons, contractors, for personal injuries. As the plaintiff was walking along the Strand last June a piece of timber, weighing 200lb., which was being shifted from a mansion at 336, Strand, W.C., by a workman in the defendant's employ, fell on him, causing serious injuries, one of the effects of the accident being that plaintiff's left leg had to be amputated below the knee, while he also lost the sight of one eye.

On Thursday, in last week, Mr. G. W. Willcocks, M.Inst.C.E., held an inquiry at Pembury on behalf of the Local Government Board, into an application by the Tonbridge Rural Sanitary Authority for a provisional order to compulsorily acquire lands required for the purposes of a sewerage scheme for the parish of Pembury. Mr. W. Vaux Graham, engineer of the scheme, explained the proposals.

The Education Committee have decided that the associateship of the Royal College of Art is to be granted to all those who, having passed satisfactorily through at least two years' training in the Royal College of Art or National Art Training School, have obtained the Art Master's Certificate, Group I., and two certificates of other groups. Applications for the diploma of associateship should be made by those past students of the college who are qualified for it under the above rule to the secretary, Department of Science and Art, South Kensington, London, W.

At the Old Bailey, on Friday, John Jolly, 47, builder, was indicted for shooting, with intent to murder, police-constable Hill, of Stratford, for causing him to be arrested for disorderly conduct. The bullet struck the constable behind the ear, and he is now suffering from facial paralysis. Justice Grantham, in sentencing the accused to seven years' penal servitude, said that if Hill had died nothing could have saved Jolly from the gallows.

Our Office Table.

"Architecture versus Building" was the title of a lecture given at Carpenters' Hall on Monday evening by Professor Banister Fletcher, C.C., J.P. Mr. A. Preston, past-master of the company, presided. Professor Fletcher pointed out that the great end of art was pleasure, and proceeded to describe the affinity of art and architecture. To show how practical was the work of the architect, he gave some drawings of buttresses, indicating first the ordinary "shore" of the builder, and secondly the same end accomplished by the architect's more pleasing buttress and flying buttresses. The point the speaker emphasised was that no ornamentation of architecture could be good which structurally was bad, and this he illustrated by a specimen of an exceedingly ugly Decorated French buttress. Passing on to the necessity of the study of proportion as an essential characteristic of architecture, the professor gave some useful rules which might be generally applied in the construction of ordinary houses, dealing more especially with the proportions of windows, doors, and staircases. Many excellent views were shown, some of them of the most admired architectural types known to the world; and, as a concluding remark, the lecturer pointed out that nothing was beautiful in a design unless it was meant to serve some good end. Finally, some lantern views were shown of famous buildings.

The London School Board have received a report from the School Management Committee with regard to a scheme drawn up by Mr. Lyulph Stanley for regulating the work in connection with the alteration and improvement in schools. Mr. Stanley stated that the Board had from time to time sanctioned the improvement of the earlier schools by the addition of halls better cloak-rooms, wider corridors, additional staircases, and so forth. The time had come when the Board should consider systematically and methodically the question of improving its older schools. The Works Committee had furnished a list of 25 schools where halls could be added at a moderate cost. There were some of the older schools, especially in the poorer and crowded neighbourhoods, where improvements were greatly needed, although in some cases they would be very costly. It was suggested that the School Management Committee should draw up a list of such schools, and that the Works Committee should be asked to report whether it was practicable to improve these schools, and, if so, at what cost. The Works Committee should also report in the case of all the schools in either list whether it would be practicable to enlarge them, and whether the improvements could be more easily carried out along with enlargement. It was probable that, taking one school with another, at least 16 schools a year could be brought up to date. There were in all 175 schools without halls, which should, sooner or later, be dealt with. Under this scheme they would be taken in hand gradually, and probably nearly all be made suitable in about a dozen years. The School Management Committee have approved of the principles set out in Mr. Stanley's memorandum, and proposed that £100,000 in the coming year be set apart on loan for the purpose of improving old schools. Consideration of the matter has been postponed.

At a special meeting of the Birmingham, Tame, and Rea District Drainage Board, held on Friday, a vote of condolence with the family of the late Mr. W. S. Till, for many years engineer to the board, and expressing appreciation of his distinguished services and zeal as an engineer, was passed. It was decided to terminate the arrangement with the Birmingham Corporation by which the surveyor of that city acts as engineer to the board, and the resignation of Mr. John Price, city surveyor, of the office of deputy engineer to the board, was accepted, with thanks for past services. Mr. John Knight, at present assistant engineer, was appointed as engineer, with a residence at Tyburn and a salary of £600 a year.

The Department of Science and Art has received information, through the Foreign Office, of an Art Exhibition to be held in Vienna this year in celebration of the 50th anniversary of the Emperor of Austria's accession. The exhibition will be opened about the middle of April and closed at the end of June, and the works will be arranged in the following groups:—Architecture, works of sculpture, painting, reproducing arts. Further information respecting the exhibition

can be obtained from the Committee of the Jubilee Exhibition of Fine Arts, 1898, Kunstlerhaus, I Lothringerstrasse, No. 9, Vienna.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Carpenters' Hall Free Lectures. "Municipal Control of Buildings," by Dr. G. B. Longstaffe. 8 p.m.
Society of Arts. "The Thermo-Chemistry of the Bessemer Process." Cantor Lecture No. 2, by Professor W. Noel Hartley, F.R.S. 8 p.m.
Surveyors' Institution. "Tithe-Rent Charge Recovery," by H. M. Grellier. 8 p.m.
Royal Institute of British Architects. "Heraldic Drawing and its Adaptation," by J. D. Crace. 8 p.m.

Tuesday.—Institution of Civil Engineers. Discussion on "Calcium Carbide and Acetylene." 8 p.m.

Wednesday.—St. Paul's Ecclesiological Society. "Notes on the Brasses of Middlesex," by Mill Stephenson, F.S.A. 7.30 p.m.
Society of Arts. "The Preparation of Meat Extracts," by C. R. Valentine. 8 p.m.

Thursday.—Society of Architects. "The Position of Owners of Property with Regard to Rights of Light and Other Easements, with a Suggestion for Future Legislation," by A. A. Hudson, Barrister-at-Law. St. James's Hall, Piccadilly, W. 8 p.m.
Institution of Civil Engineers. "Geology in Relation to Engineering," by Professor W. Boyd Dawkins, F.R.S. 8 p.m.

Friday.—Architectural Association. "Constructional Steelwork," by T. C. Cannington. 7.30 p.m.

THE ARCHITECTURAL ASSOCIATION.

MARCH 25th, ORDINARY GENERAL MEETING, 9, Conduit-street, W., 7.30 p.m. Paper by Mr. T. C. CUNNINGTON on "CONSTRUCTIONAL STEELWORK."
MARCH 26th, SPRING VISIT to Lord Windsor's House, corner of Mount-street and Park-street, W., Mr. F. R. Wade, Architect. 3 p.m.

E. HOWLEY SIM, } Hon. Secs.
G. B. CARVILL, }

The Society of Architects.

Founded 1884. Incorporated 1893.

The FIFTH ORDINARY MEETING of the Society of Architects for the Session 1897-98 will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, March 24th, 1898, at Eight o'clock p.m., when a Paper will be read by Mr. A. A. HUDSON, A.S.I., Barrister-at-Law, entitled "THE POSITION of OWNERS of PROPERTY with REGARD to RIGHTS of LIGHT and other EASEMENTS, with a SUGGESTION for FUTURE LEGISLATION."

ELLIS MARSLAND, Hon. Sec.
MONTAGU BALDWIN, M.A., Sec.

CHIPS.

At Newquay, Mr. O. E. Meade King, M.Inst.C.E., held a Local Government Board inquiry on Wednesday, concerning the application of the Newquay Urban District Council to borrow £400 for works for street improvements, £330 for the provision of a steam fire-engine, and £2,300 for sewerage works.

On Thursday evening in last week the new organ built in the Congregational Church, Castleton, Lancs, was opened. The organ has been built by Messrs. Driver and Company, of Burnley, at a cost of between £300 and £400.

An inquiry was held at the council-room, Morecambe, on Fricay, by Colonel R. J. Hepper, Government inspector, into an application by the district council to borrow £1,418 for the purpose of extending the water supply, and £10,000 for the extension of the electric lighting. It was stated that since the last census was taken the population had increased by nearly 4,000, whilst the assessable value was estimated at £45,600.

Mr. French has been appointed to the chief agency of Lord Penrhyn's Carnarvonshire, Denbighshire, and Anglesey estates, in succession to the Hon. W. E. Sackville West, who has retired.

The organ of Clyst-Hydon Church, Devon, after fifteen years of silence, was reopened on Sunday. The work of reconstruction and renovation has been carried out by Messrs. Minns and Co., of Taunton.

The latest addition to the vast collection in the private apartments at Windsor Castle is a life-size bust in white marble of Prince Henry of Battenberg, by the Countess Gleichen, daughter of the late Prince Victor of Hohenlohe-Laugenberg. The bust has been placed on a pedestal at the upper end of the corridor.

The will and codicil of Mr. Charles Park, of 154, Piccadilly; 99, Long Acre; 157, Haverstock Hill; and Wingham Lodge, Minster, artist colourman, who died on January 28th, have been proved, the value of the personal estate amounting to £33,898 18s. 7d.

Trade News.

WAGES MOVEMENTS.

The State of Employment and Trade.—The monthly report for February of the Labour Department is based on 2,290 returns—viz., 1,648 from employers, 508 from trade unions, and 134 from other sources. The state of employment shows a marked improvement compared with a month ago, though not quite up to the level of the corresponding month in last year. The labour market has been very little disturbed by disputes, and the changes in wages have also been comparatively unimportant. In the 116 trade unions making returns with an aggregate membership of 466,362, 4·4 per cent. were reported as unemployed at the end of February, compared with 4·96 per cent. at the end of January, and with 3 per cent. with February, 1897. Employment in the building trades is very good, the percentage of unemployed union members being 1·7, compared with 2 per cent. for January, and also for February, 1897. The furnishing trades are more actively employed, the percentage of unemployed union members having fallen from 5·1 at the end of January to 2·8 at the end of February. The percentage for February, 1897, was 3.

Paisley Town Council have adopted a resolution declaring that the value of land apart from improvements should be rated for local purposes, and has signed a petition to Parliament for the necessary powers to give effect to this principle.

Operations have now been commenced in connection with the erection of the new lighthouse and fog-signal station for the Irish Channel, on the Blackhead, N.B., a bold promontory over two miles north of Portpatrick harbour, and commanding a wide expanse of the Channel. Whinstone is being quarried on the adjoining farm of Killantringan. The buildings will compriso a light-tower, engine-room, and dwelling-houses for the principal and assistant lightkeepers.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIV.—No. 2255.

FRIDAY, MARCH 25, 1898.

THE PROPOSED NEW GOVERNMENT BUILDINGS.

ONCE more the question of providing accommodation for certain public departments has been brought before a Committee of the House, and this time with greater probability of success. The scheme proposed by the Government, and detailed by Mr. Akers Douglas, as mentioned by us elsewhere, involves the expenditure of a sum of more than two millions and a half, and comprises the building of the War Office, for which £475,000 is asked; a further sum of £600,000 for the erection of the buildings on the Parliament-street site; another £100,000 for the completion of the purchase of that site, including the widening of that street; also a sum of £150,000 for the completion of the Admiralty Buildings; £300,000 for additional Post Office buildings; and lastly a sum of £800,000 for the completion of buildings for the Science and Art Department at South Kensington. From this expenditure there will be received for the spaces and areas available after the new buildings are erected a sum of about one million sterling, so that the expenditure will be lessened by nearly half. The resolution was carried by a large majority.

When it is borne in mind that a very considerable sum is paid yearly for temporary office accommodation amounting, it is said, to something like £16,000, in addition to premises on Crown land; that a large area of unused land is lying idle in Whitehall, which is valued at £10,000 rental; that, in addition, large sums have been expended in altering and fitting these temporary buildings and leasehold premises, and in appointing caretakers, office keepers, and a large staff of clerks and messenger required in carrying on the work of the department, scattered as it is in many cases over a large area, the wonder is that there has been so much delay. It is quite time that the Government took the matter in hand. The Carrington House site, Whitehall, has been a useless waste for years, besides being an eyesore in one of the best parts of London. In another case, in Charles-street, land acquired 30 years ago had been paying no interest. The Government this time means business. The purchase of Parliament-street site, and the various Bills for promoting the acquirement of the Carrington House site for the erection of the War Office, have been matters of public knowledge. Last year the Select Committee went a step further, and recommended the appropriation of sites for the different departments. The Parliament-street site was proposed for the Board of Trade and Education Department, and the extension of the Local Government Board. Now, having acquired the sites or most of them, the Committee asks Parliament for money to erect the buildings. Concentration has been found to be so urgently demanded for the despatch of business, that the building of offices on convenient sites not far from the Houses of the Legislature cannot any longer be delayed. But the question of design has yet to be decided. Are we to have a repetition of the failure of the existing buildings at Whitehall, or is there to be—as there should be—a public competition in each of these public departments? Are certain Government officials to be chosen to carry out the intentions of the committee, in conjunction with some eminent architect, or is the country to have the benefit of the talent of the whole profession? These are questions that ought to be answered. The story told by Sir H. Campbell-Bannerman confirms the impression of all who have ever visited the new Home Office block. When that costly building was completed, it was found to be so inconveniently arranged, draughty, dark, and uncomfortable, that the officials of the War Department, on being invited to use it at first by Lord Cranbrook, on their preliminary inspection, said: "Sir, for Heaven's sake let us stay where we are, for, bad as our building is, and constructed after the manner of a rabbit-warren, we prefer it to the ghastly, uncomfortable, dark and draughty, incommodious building which you have been good enough to offer us." The building, the same speaker said, was a scandal, and those who were housed in it, experienced public servants, could testify of the inconvenience of that structure. Dark corridors, often lighted by gas, prevail, and enormous rooms, many of them more suitable for state purposes, are set apart as offices where compactness, comfort, and warmth are demanded. The size and proportion and position of a room for an office where business is transacted are most important factors, so is light; but in the building referred to, these requirements have been disregarded, and the architect only thought of dividing up his space along the corridor into rooms of large size, and consequently much too high to suit his elevation. It is very difficult, we know, to plan a building for offices and to give it externally a palatial character; hence, it was a mistake to select a Classical or Italian style for such a purpose. It is almost impossible to make such a treatment practicable. The Classical façade demands height and dignified fenestration, and equal spacing, and every architect knows how impossible it is, without a large use of entresol arrangements, to make comfortable high rooms, or to avoid "tank rooms," or dead walling over the windows. According to Sir W. Harcourt, "each public building in succession seems worse than the last," and he gave a by no means flattering picture of the Home, the Colonial, and the Foreign Office when we are told that, even on a midsummer's day, one cannot get into the Foreign Office except through a passage lighted by gas. The new Admiralty block, bereft as it is of many of the features designed by its architects, is an exception; the rooms, as we know, are cosy and comfortable.

The outlay for the South Kensington scheme, large as it seems, is a foregone conclusion. It is a disgrace to the country that such a valuable collection should be housed, as it is, in temporary buildings of an inflammable kind. The designs for the completion of the buildings have long been in abeyance. Mr. Aston Webb's admirable design was accepted in competition in 1891; but little since has been done owing to lack of funds. The report of the Commission on Secondary Education has suggested the removal of the secretariat to the Education Office; it is also decided to remove the official residences, &c., from the Museum on the east side. These changes will enable increased accommodation for both the Science and Art Departments, and will enable an effective façade to be erected along the frontage in Cromwell-road and Exhibition-road—alterations which will require some revision of the plans.

The Post Office Savings Bank Department is also to be furnished with a new building at West Kensington. There will be some objection to the removal of this department so far west and from the City buildings; but the cost of a sufficiently large City site is one reason for the proposal, and the concentration of the Post Office buildings proper near the central office in the City is secured by this arrangement. Those intrusted with these great national buildings have to face future expansions of the departments, and the plans for them will have to meet the need of extension.

The question that most nearly concerns the profession is the bestowal of the patronage. According to Mr. Akers Douglas, the intention of the Government is not to go to competition, because public competition has failed in the past. But why has it? The idea seems to be to employ their own official advisers to arrange the offices, and to appoint an architect for the purpose of clothing the buildings so planned. We know what such a view is worth—how often it has been tried and found wanting. It is like trying to fit a symmetrical garment to a deformed figure. Nor is it possible to produce any architecture worthy of the name under such a system? Yet it is expected of these buildings that they should "add very largely to the architectural beauty of London"!

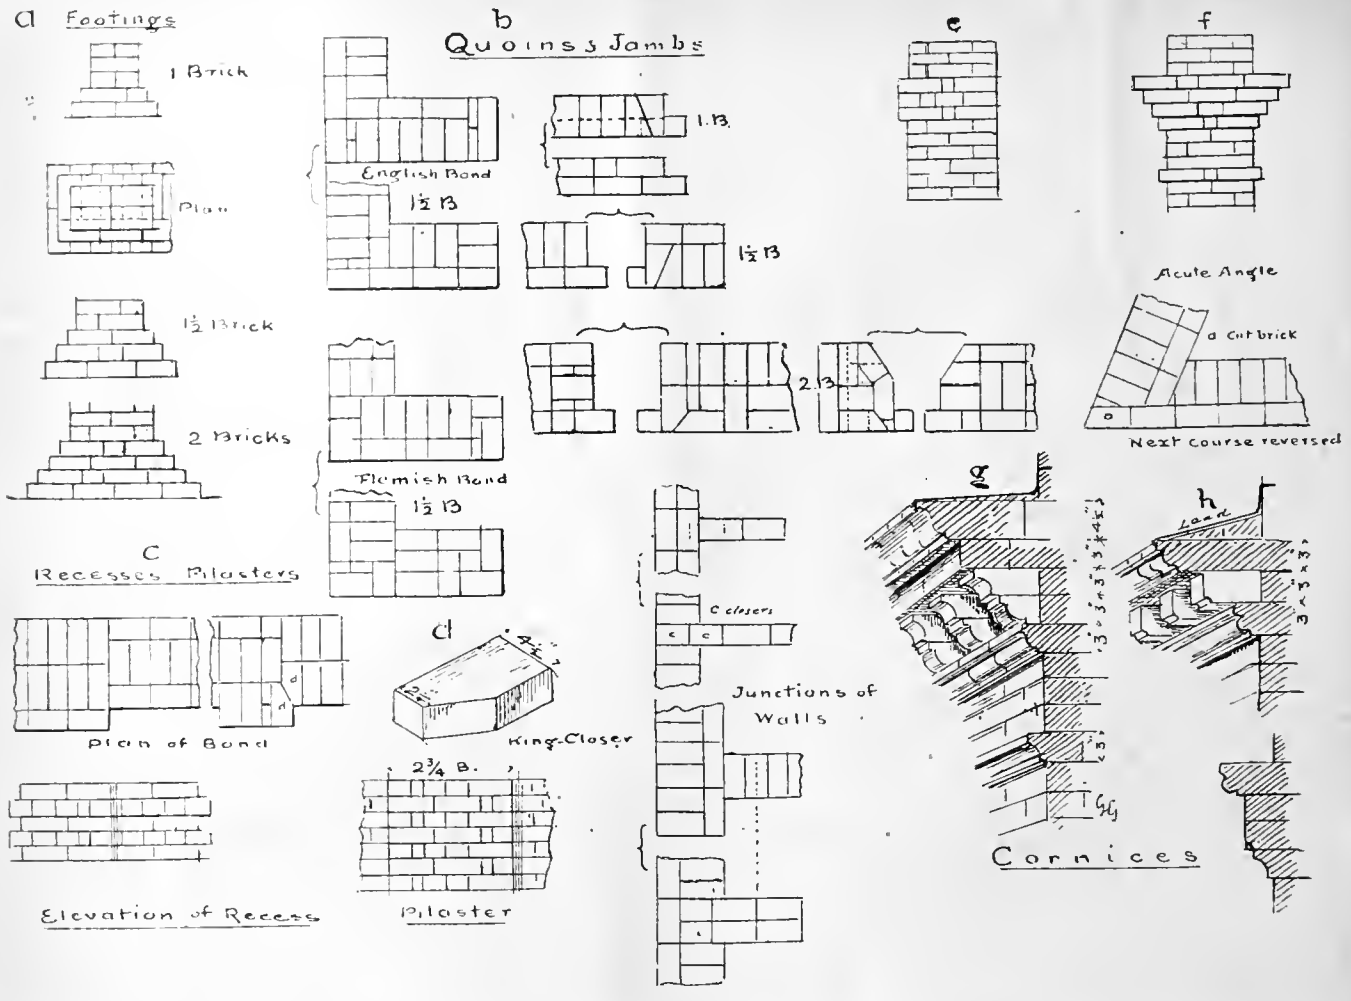
MODEL SPECIFICATIONS.—V.

BRICKLAYER—(*continued*).

WE have made a few general remarks on certain details of damp-proof walls and courses, footings, and bond in our last article, and now give a number of details which have reference to the bond of quoins and jambs (see *b*), for windows and doors, recesses and pilasters (*c*), angles of wall, bay-window bond, &c. These will explain themselves; but what we desire to emphasise is the importance of architects not only describing in general terms certain kinds of brickwork, but, when necessary, illustrating their meaning and intention by detail sketches such as those here given. The stereotyped phrases: "Carry up walls in a uniform manner, &c.," or "All brickwork to be laid in Old English bond, &c.," or "Build piers and mullions with hard, well-burnt bricks, &c.," convey very little meaning to the bricklayer as to the mode of executing the work. The bond of main and cross walls, of angles, of jambs, and reveals can only be explained by diagrams such as those given.

The importance of bond cannot be overestimated, especially in buildings of any height, or which have to carry heavy floors, and therefore for such buildings English bond ought always to be specified. The great object of bond is to break the vertical joints; in other words, to prevent them following through more than one course at a time. For thicker walls than those of one brick, English bond is to be preferred. For heavy building or where any irregular settlement or loading is to be apprehended, hoop-iron 1in. or 2½in. wide and ⅛in. to 3-16in. thick, tarred and sanded, should be used. If laid every 5ft. or 6ft. in height, with the courses above and below set in cement, it affords considerable strength to a wall, particularly when it is laid between the tiers of windows.

A few points in bonding deserve attention. One is the connection of main and cross walls. It is necessary that every other course should enter the thicker or main wall, as in plan (*c*), which is effected by the use of bats, as shown. Unless this is specified, bricklayers are apt to neglect the tie. The bond at window and door openings is often defective. It is necessary to insert a "closer" next the jamb in one course or to use a "king-closer" (Fig. *d*) as in the two-brick wall (plan *m*) with two closers in the jamb. Again, in forming angles of walls, acute or obtuse (see plans of those angles *i*), specially made or cut bricks ought to be used at the corners, which should be mentioned. Also in carrying up mullions for windows of bays, bond can only be secured by cutting the bricks or using special moulded ones (see plan K). In all these and other cases the architect should furnish a detail of the bond of two courses or give a marginal sketch, and mention ought to be



made of the particular moulded brick or of the maker's name. An ordinary specification does not give any useful information to the bricklayer on these points, nor do the contract plans afford any help. The work is executed in the workman's own way, and straight joints occur as a consequence.

Moulded bricks enter very largely into modern buildings in the various forms of sills, jambs, architraves, mullions, plinths, string-courses, cornices; and in every special case the particular section or profile and the maker's name ought to be given. It may be as well to state here that some of the leading firms manufacture moulded bricks in a large variety of profiles in both stretchers and headers, a few sections of which we shall give next week. These moulded bricks are of the usual size to bond with common brickwork, and are made with external and internal angles of 45°, suitable for bay windows or turrets, and mitres, so that any architectural arrangement can be formed. One firm shows over 300 sections for various purposes. Some of these are 3in. or a course in thickness; others are made 4½in., the width of a brick, suitable for strings, cornices, or sills, and there are 6in., 9in., or 12in. moulded bricks adapted for cornices, bands, and other purposes.

In the present article we give a few clauses in general use, and in the following one we intend to deal with more ornamental forms of brickwork in which cut or moulded bricks are used.

The following clauses are for ordinary kinds of work, and may be introduced or not as required.

15. *Turn Rough Arches.*—Over all drains (or cesspools, or wells, or other excavation), turn one-brick rough arches in cement mortar wherever they pass through, or exist, in the line of walls.

16. *External Arches.*—The external arches shown in elevations to be of approved malm bricks (or Fareham red rubbers) cut and gauged.

17. *Relieving Arches.*—Rough relieving arches to be formed in two half-brick rings in cement (or mortar) from ends of lintels, over all internal openings; also form all rough inverts in two half-brick rings in cement mortar under all openings of external or internal walls where required.

18. *Form Flues for Ventilation.*—Carefully form all flues for ventilation or otherwise, parget and core the same. Or—

Form [so many] air-inlet flues, 9in. by 4½in., for ventilation, and render the inside of flues smooth in cement. Or—

Form [so many] flues, 9in. by 4½in., for Tobin's tubes, with 9in. by 6in. iron gratings on the outside. Or—

Form outlet ventilation flues from each room, 9in. by 9in. or 9in. by 4½in., carried up by side of smoke flues, parget and core same, and provide hit-and-miss gratings, p.c. 10s. each. The tops of flues to have iron gratings in stacks, 9in. by 9in., as shown.

Chases for Pipes.—Form chases where directed for soil, waste, hot and cold water pipes, and make good afterwards.

19. *Dry Areas.*—Round the building (or the side specified) form a dry area 12in. wide with 9in. walls in cement mortar, built on a bed of concrete, below the footings of buildings. The outside wall to be rendered in cement and sand. Cover top of area with a tooled York stone, weathered (or inclined) to throw off water, a few inches above ground-level. The bottom channel to be formed in concrete to an inclination for gully, and rendered in cement. Every 10ft. apart form air-ducts for ventilation, or insert 9in. by 6in. cast-iron air-gratings or bricks where required. Or—

20. *Dry Walls.*—Build against all outer basement walls where shown on plan or section, wherever they abut on the soil outside, a 9in. wall in cement mortar with a cavity of 1in. (or ¾in.), and fill in the same with mastic asphalte or White's "Hygeian Rock" Building Composition, and finish top of wall 6in. above ground-level with rubbed Portland stone let into wall.

21. *Storage Tanks.*—Build a storage tank as shown on plans (or large enough to hold a 16 weeks' supply), with piers and arches in stock brickwork in mortar composed of 1 part Portland cement to 5 or 6 parts of ballast and sand, and rake out joints to form a key to cement rendering or asphalte. The roof to be supported by rolled iron or steel joists (6in. or 8in. by 4in.) every 2ft. or 3ft. apart, on hard stone templates. Fill in between joists with cement concrete (1 to 6), and weather the top and render the same with Portland cement 3 to 1. The outside of walls of tank to be rendered with Portland cement (1 to 1) ¾in. thick, and the inside to be rendered with Portland cement ¾in. thick, with angles rounded and finished with neat Portland cement ⅜in. thick (or build a half-brick lining in glazed brickwork in neat cement, well grouted with neat cement between it and the main walls ¾in. thick; or line the inside with White's Hygeian Rock Composition, or mastic asphalte applied according to patentee's directions). The floor of tank to be formed in concrete to proper falls and channels; the concrete to be 3in. thick, composed of 1 of Portland cement to 4 parts of fine shingle, with corners thickened; the same to be rendered in neat Portland cement ¾in. in thickness (or line with White's Rock Composition). Form manhole to roof of tank, and cover same with galvanised iron cover, with iron ladder, &c.

22. *Vaults and Light Areas.*—Turn arches over cellars in cement mortar of two (or three) half-brick rings, and lay over the arches a coating of Claridge's asphalte (or White's Rock Composition) ¼in. thick, the same to be brought up to curb.

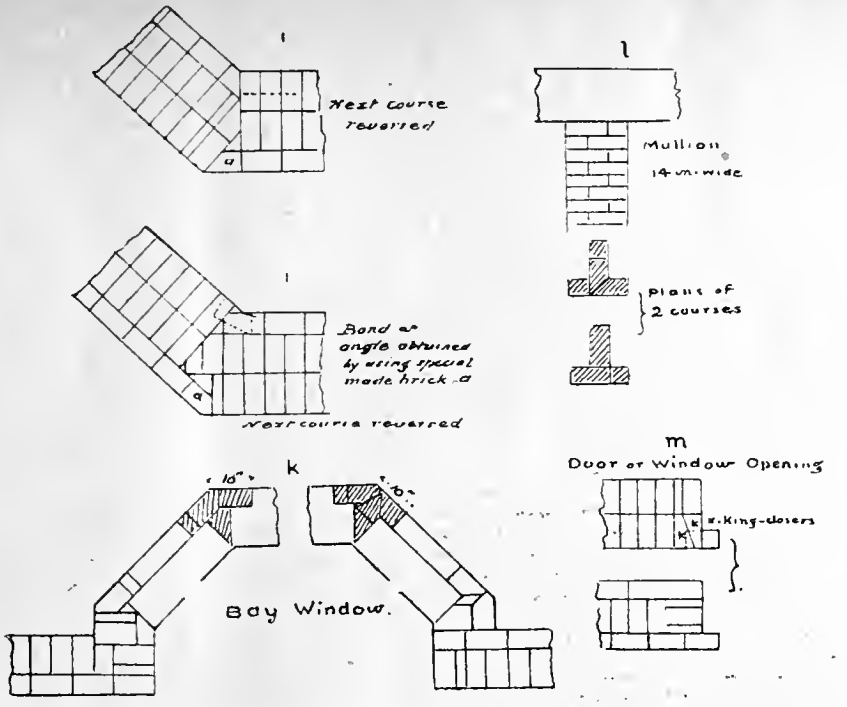
Form small arches as shown in plan before each basement window; the back wall to be hollowed (or battered), and to have a course of footings in a bed of concrete which is to form bottom of area. The wall to be built in cement mortar, and to have an outer lining of asphalte (or White's Rock Composition) ¼in. thick. The inside may be lined with white glazed bricks. Or—

The outside walls of vaults (or basements) to have the asphalte damp-course extended to top of walls, and continued over top of vaults, and turned up round coal-plates or pavement lights, as required, to make vaults watertight.

23. *Trimmer Arches.*—Turn to all fireplaces above ground floor for hearths, half-brick in cement trimmer arches. Or—

Turn half-brick trimmer arches in cement against all fireplace openings 18in. longer than their respective openings, and 18in. wider. The arches to abut against feather-edge springers, and the top of arch to be brought up level with concrete to receive hearths: or level in cement concrete (1 to 1), and float and trowel over with neat cement ¾in. thick to form hearths.

24. *Channels for Pipes.*—Form channels for pipes



under floor on a concrete bottom 6in. thick, with half-brick in cement sides with stone coverings.

25. *Flue Pipes.*—Line with fireclay oblong pipes (or circular) 14in. by 9in. (or 12in. by 9in. or 9in. diameter) the flues.

26. *Stoves.*—Properly set in firebrick and cement the kitchen range, hot plates, &c.

27. *Rake Out and Point.*—Rake out joints for flashings, and point same in cement, and to all frames. The joints to all facings where required to be raked out and weather-pointed in cement.

28. *Glazed Brick.*—The areas (marked in plan) to be faced with Hartshill Brick and Tile Co.'s (or approved) white glazed bricks, finished with a weather joint. Or—

Face the walls of lavatory and bathroom with cream or white glazed enamelled bricks and a dado of approved colours, and pointed in Parian or cement, with coloured joint. Or—

Line walls of lavatory with best ⅜in. white, cream or blue glazed tiles in 6in. squares, set in Portland cement on a backing of cement-mortar, with a dado and skirting. Or—

Line with white glazed hanging tiles backed and bedded in Portland cement; the area walls nailed every other course.

29. *Copper.*—Build copper with 9in. firebrick in fireclay on footings on a bed of concrete, with proper flue and ashpit, and provide and fix furnace-door and frame, with bars and damper and soot-door; and set in brickwork a strong-made copper pan, to hold 40 gallons, weighing not less than 1½lb. per gallon (or Young and Marten's galvanised iron pan and frame, p.c. 65s.); render in cement and sand.

30. *Scullery Sink.*—Provide and fix (or set) one of Doulton's (or Duckett's or Crapper's) glazed stoneware sinks, 3ft. by 2ft., p.c. 15s., on half-brick supports in cement, and pin into wall in cement.

31. *Chimneys and Stacks.*—Build all chimney-breasts on proper footings on a bed of concrete, and parget and core all the flues, and properly bond the "withes," and make the flues airtight. The chimney-shafts and tops to be built, as shown, in cement mortar, the pots (if any) to be set in cement, and well flaunched up and weathered at top.

32. *Parapets and Eaves.*—The upper four courses of parapets and eaves to be built in cement mortar, with red (or moulded) bricks in accordance with design. Cement fillets to be run to all gables, chimney-stacks, &c. Put tile creasing round chimney-shafts, stopped at sides in cement with Portland cement flashings. Make good after all other trades.

In connection with this trade several important rules and by-laws apply to it, which the architect must peruse before writing his specification. The London Building Act, 1894, particularly applies to external, party, and cross walls (see sections 53—81, Part IV.), and the schedules of thickness of walls relating to buildings of a private or dwelling-house kind, and those of the warehouse class, which are familiar to our London readers. Section 54, Part VI. is important, and applies to "Recesses and Openings" made in external walls. Sub-clause (*a*) provides "That the backs of such recesses are not of less thickness than 8½in., and (*b*) that the area of such recesses and openings above the ground story do not, taken together, exceed one-half of the whole area of the wall above the ground story in which they are made. (2) Recesses may be made in party-walls, provided (*a*) that the backs of such recesses are not of less thickness than 13in., and (*b*) that over every recess so formed an arch of at least two rings of brickwork of the full depth of the recess be turned on every story, except in the case of recesses formed for lifts; but where such recess does not exceed 5in. in depth, corbelling in brick or stone may be substituted for the arching; and (*c*) that the area of such recesses do not, taken altogether, exceed one-half of the whole area of the wall of the story in which they are made; and (*d*) that such recesses do not come within 13½in. of the inner face of the external walls. (3) An opening shall not be made in any party-wall, except in accordance with the provision of this Act in relation thereto." These requirements may be modified in certain cases, and the superintending architect (on application made to him) may consent to any modification or relaxation of this section, in respect to the area of recesses and openings in special cases.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE tenth ordinary meeting for the present session of the Institute was held on Monday evening, and was very numerously attended. The president, Professor George Aitchison, R.A., occupied the chair.

THE NEW GOVERNMENT OFFICES.

Mr. WILLIAM WOODWARD asked whether any communications had passed between the Council and Her Majesty's Office of Works, with reference to the designs for the proposed new Government Offices in Whitehall? The PRESIDENT replied that communications had passed; but as at present they were strictly confidential, he could give no information on the subject. Mr. WOODWARD asked whether, as members of the Institute were not all able to attend the meetings, but were scattered over the United Kingdom and the Colonies, an official intimation of the nature of the correspondence might appear in the next issue of the Institute *Journal*? (Several voices: No, no.) The PRESIDENT said that until the people who had asked them to regard these matters as confidential requested them to make them public, they would be unable to publish them.

PRESENTATION OF MR. PENROSE'S PORTRAIT.

The PRESIDENT then requested Mr. Alma Tadema, R.A., to formally unveil and present to the Institute on behalf of the subscribers a portrait of their late President Mr. F. C. Penrose, who was so well known throughout all the world for his discovery of the optical refinements which governed Greek architecture. The subscribers had been so fortunate as to get Mr. Sargent to execute the commission, and having seen the portrait, he would only say it was well worthy to be hung alongside those they already possessed, executed by J. P. Knight, William Boxall, George Richmond, Frank Holl, and their distinguished honorary Associate, Alma Tadema.

Mr. ALMA TADEMA said he regarded it as a great privilege to be called upon to unveil the portrait of a man he esteemed so highly painted by a man whom he esteemed no less. They recollected that during his term of office Mr. Penrose was called upon as the English member of an international commission of three architects to revisit Athens and advise as to what steps should be taken to save the Parthenon from further damage after a seismic disturbance. To have had such a president was an honour to the Institute, and to possess such a portrait of him added very much to the collection, which, he would venture to suggest, were worthy of being hung in a special gallery. [Hear, hear.] Mr. TADEMA then, amid general applause, unveiled the portrait, which depicts Mr. Penrose at nearly full length. He is reported as seated in a high-backed armchair, with head slightly raised, and looking almost directly forward; the knees are crossed, and the hands folded just above them. On the right of the chair is a portfolio of drawings. The general expression of opinion afterwards was highly favourable.

The PRESIDENT referred at some length to the investigations and measurements carried out in Athens by Mr. Penrose for the Dilettante Society, which established for all time the truth of Wilkins's surmise as to the proper reading of the passage in Vitruvius as to the optical refinements in the lines of the buildings adopted by the Greeks. He proposed a vote of thanks to Mr. Sargent for the admirable portrait he had given them.

Mr. J. S. SARGENT, R.A., who spoke with obvious diffidence and embarrassment, briefly replied.

HERALDIC DRAWING AND ITS ADAPTATION.

Mr. JOHN D. CRACE, Hon. Associate, read a paper on this subject, illustrated by a number of original cartoons by well-known architects, and by drawings, tracings, and photographs of Mediæval examples, specimens of book-plates, and a magnificent Spanish cloth of State, heavily embroidered in gold. He mentioned that in the drawing of heraldic devices, one leading principle applied—the necessity of recognising what has to be said, and how to say it simply and directly. The heraldic device was intended to appeal, not to the sensibilities or emotions, but to a simple intelligence, to be rapidly understood. The eagles, lions, roses, or fleurs-de-lys of heraldry were not to be thought of as pictorial illustrations of the animal or vegetable creation, nor even as emblems, but as symbols. The conventional or symbolic representation of the heraldic "charge" conveyed certain limited information at a glance. Heraldry had been described as "out of date," "antiquated nonsense"; but modern equivalents for the heraldic "ordinaries" might easily be found. The effigies painted on tavern signboards showed at once the name and purpose of the house; the colours of the jockey's jacket conveyed distinct information; flags, whether for signalling or for distinction, were actually heraldic. The lecturer cited instances of the ease with which facts about people dead centuries ago could be learned from the heraldry displayed on relics associated with them which had come down to the present day. In decorative heraldry, whether architectural or other,

EXTREME CLEARNESS OF EXPRESSION

is required; the more so since frequently the examples are distant from the eye, or in positions where other forms more important to the composition must be so rendered as to claim the first attention. The details have also sometimes to conform to cramped and difficult spaces, such as spandrels or glass inclosed by intricate tracery. Allusion was made by the lecturer to the close relationship between the symbolic design of

heraldic charges, and the less direct forms used in expressing ideas by writing. Looking back to the remote times of Egyptian art, each of the kings and queens of the various dynasties could be distinguished by the "cartouche" bearing the symbols of that sovereign. That "cartouche," repeated on the cornice of a temple, was almost as heraldic as the shield repeated on the cresting of an English monument, and its object was virtually identical. The animal devices used as symbols on Egyptian monuments of 3,000 years ago had never been surpassed, and should be well studied by the heraldic draughtsman. Though used to convey the sense of words or sounds, they were also used to convey certain information even when writing came into general use. For monumental purposes the well-recognised symbol conveyed the idea more promptly. It is of primary importance that the object representing the idea should be so drawn as to be promptly recognised; and the art of conventionalism is the art of selecting the most characteristic points, leaving details to be filled in or not according to circumstances. Having shown under what conditions it was permissible to multiply or omit details, and when "naturalism" or fanciful treatment might be indulged in, provided the object represented was as far as possible unmistakable, the lecturer went on to speak of heraldic draughtsmen of the last fifty years who had successfully grasped the problem of sound conventional drawing as applied to heraldry, selecting for mention the names of those deceased—Willement, Pugin (some of whose original drawings for the heraldic glass in the Houses of Parliament, lent by Messrs. Hardman and Powell, were exhibited in the meeting-room), John Powell, James West, Clement Heaton, and William Burges, all in their several ways real artists. So far as heraldic art was concerned, Pugin was *facile princeps*. In point of design and arrangement, his heraldic glass at Westminster was without equal. The lecturer then exhibited a model, and dealt with the relations between the helm, the crest, the wreath or torse, and the mantling, describing and explaining the origin and purpose of the various parts, and some methods of treatment.

CONTINENTAL HERALDRY.

Touching heraldry abroad, the Germans had always maintained a love for heraldic device; and the principal front of the new Parliament House in Berlin is ornamented with two fine heraldic panels, in which the shields are combined with sculpture of very high artistic merit. In Spain heraldry was freely used for the decoration of architecture—there were notable examples at Burgos and Toledo. Magnificent cloths of State, embroidered with the arms and badges in gold and colour on silk or velvet grounds, were also in use in Spain. Such decorations, the lecturer considered, might be introduced into municipal and other public ceremonials in our own days. A really fine heraldic cloth would make a much more imposing background to a royal or municipal group than the extemporaneous and tawdry finery ordinarily the expedient on such occasions, and the cost, in the long run, be less than what is now expended spasmodically on temporary rubbish. As examples of the valuable decorative effect of heraldry in architecture, the lecturer instanced the blazoned shield in the boss at the intersections of rib-vaulting, or on the hammer-beam of a timber roof, or in some of the high chimney-pieces illustrated in the paper read a year since by Mr. J. A. Goteh. Having summed up the essentials necessary to good heraldic designing, the lecturer, in conclusion, read some notes by Mr. George W. Eve, author of the recently-published work on "Decorative Heraldry." These touched upon the influence of architecture on heraldic designs in book plates, perceptible from the very earliest examples; the value of the panel as a basis of design, as shown in the works of Sebald Behem, Virgil Solis, and others; the extensive use of architectural details in the armorial work of Albert Dürer and his school, and in the elaborate compositions of Jost Amman; and the modifications in treatment the armorials have undergone by the influence of the sculptures and coats-of-arms represented in high relief.

Mr. J. Alfred Gotch, in proposing a vote of thanks to the lecturer, observed that there had been of late years a revival of interest in heraldry, and it was most desirable that architects should be in a position to draw the charges and mantling clearly and correctly. He did not himself revel in a multiplication of quarterings, but admired a simple and legible rendering of family arms. Architects and the public generally were largely in the hands of the officials of Heralds' College, and it was satisfactory to see some improvement in recent grants on the absurd and unartistic arms granted 90 years ago. They might hope for still greater improvement in the future in the training of these officials. One paramount quality was necessary in heraldic draughtsmanship — vigour. All the animals displayed in heraldry, with one doubtful exception, the mermaid, were masculine, and should possess the virility of their sex. The heraldic artist had to study how to impart interest and beauty to subjects which were comparatively tame. It was easy to draw an interesting lion or even a vigorous pig—an example of which by Pugin could be seen on the wall; but when they came to draw a porridge-pot or a wheel then difficulties began. On the great Spanish cloth of State hung on the wall they would see an excellent treatment of this very object (a wheel) in perspective. As to the mantling, Mediæval designers recognised and emphasised the fact that the material had two sides of different colours. With regard to book plates, many had been designed of recent years, and in some of them legibility was sacrificed to beauty. Modern heraldic drawing might be quite distinct from Mediæval examples, and yet very effective.

Mr. W. H. St. John Hope seconded the vote of thanks, remarking that Mr. Crace might give them a second paper on Badges and their treatment. Mediæval heraldic artists revelled in the drawing of badges, and Pugin fully appreciated their value for decorative purposes.

Windsor Herald (Mr. W. A. Lindsay) said the lecturer and Mr. Gotch had been rather hard on the College of Arms. He conceded that years ago grants were made of arms which were absurd; but the fault was that the officials of the College of Arms were then too willing to give individuals or the public what they demanded. He must demur to Mr. Gotch's suggestion that in book-plates the name ought to be clearly printed—if heraldic emblazonment was worth anything at all it set forth the name as distinctly as if it were written.

Mr. William White, F.S.A., having supported the vote of thanks, the President, in putting the motion, observed that heraldic drawing was one of the most becoming subjects to be treated of before architects, for, according to Addison's mistranslation of one of Martial's epigrams :—

> If of dull parts a stripling you suspect,
> A herald make him, or an architect.

Mr. Crace, in reply, said he concurred with Mr. Gotch that vigour was essential in heraldic drawing. The subject of Badges, suggested by Mr. St. John Hope, would make an interesting paper of itself. The College of Arms shared in the general decadence of taste on the part of the public in the first part of the century, a fault from which they were not altogether free in the second half. He was sorry he could not support the contention that the owner's name should never be added to the coat of arms on book-plates. If they examined the stall-plates of the Knights of the Garter in St. George's Chapel, Windsor, they would see that the names of the holders were engraved on many of the earliest plates.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XIX.

By an Assoc. Inst. Elect. Engs.

MEASURING INSTRUMENTS AND TESTING.

BEFORE leaving the subject of ammeters and current measurement it will be necessary to refer to a class of instrument quite distinct from those already considered, much used for standardisation purposes. These instruments are known as *electro-dynamometers*, since the working of them depends upon the mutual attraction and repulsion of two adjacent current-carrying conductors, and not upon the magnetisation of iron; the determination of current strength with these instruments, in fact, depends upon the measurement of the mechanical forces existing between the adjacent coils traversed by a current or currents. Weber was probably the first to draw attention to the fact that this class of instrument was specially adapted for making accurate measurements, and both Siemens and Lord Kelvin have introduced modern instruments depending upon the dynamical forces set up by adjacent currents. And, as Siemens' electro-dynamometer is a good example of this type of instrument, we shall consider this particular instrument to illustrate the principles underlying the action of the electro-dynamometers generally. A diagrammatic sketch of the working-parts of a

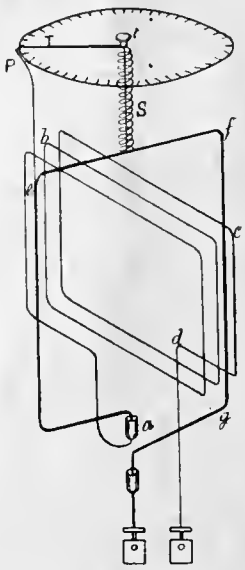


Fig. 67.

Siemens electro-dynamometer is given in Fig. 67, whilst the complete instrument is shown in Fig. 68.

As will be observed, the instrument consists of two rectangular coils, connected in series with each other. One of the coils, *a b c d*, is fixed permanently to the framework, whilst the other, *a e f g*, which is movable, and consists of one or two turns, is suspended by a silk thread and a spiral spring S. Siemens' electro-dynamometer is, therefore, an example of a spring-control ammeter, the needle of which is replaced by the suspended coil. In the normal position the plane of the movable coil, *a e f g*, is at right angles to the plane of the fixed one, the latter being placed within the former, so that their centres coincide.

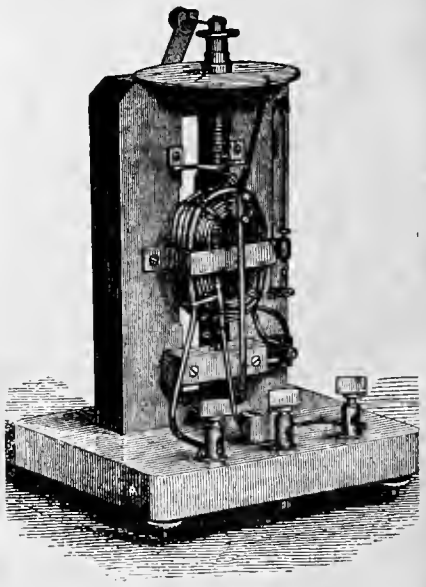

Fig. 68.

To enable the same current (which is the one to be measured) to pass through the two coils they are connected together in series by means of mercury cups, and the suspended coil is therefore perfectly free to move round the vertical suspension when the current passes. The normal position of the movable coil is indicated by a pointer, P, pointing to the zero point of a scale fixed at the top of the instrument. This pointer is attached to the movable coil, as shown, and the movement of this pointer, and therefore that of the coil, is limited

by two small pins, *p p*, projecting from the edge of the disc on which the scale is marked, one pin being on either side of the scale zero. A plan of the disc, scale, pins, pointer, torsion-index T, and torsion head *t*, is shown in Fig. 69.

Before using the instrument, it should be placed so that *the plane of the fixed coil coincides with the earth's magnetic meridian*, in which case the earth's magnetism cannot produce any deflecting effect on the movable coil, and the instrument should also be carefully levelled. It will also be observed that the upper end of the spiral spring is attached to a milled torsion head, marked *t* in Fig. 67, to which is also attached a torsion index T, to indicate the angle of torsion given to the spring. Should this torsion index not point to the zero point of the scale when the movable coil is in its normal position and no current is passing, the torsion index may be turned without twisting the spring or turning the milled head *t* by loosening a small pinching screw which clamps the torsion index to the milled head, and in this way the torsion index and pointer may be made to point to the same point without giving torsion to the spring.

On sending a current through the instrument, the movable coil tends to place itself parallel to the fixed one—*i.e.*, so that their axes are parallel, in which case the magnetic fields due to the current traversing both coils would be coincident; but this is prevented by the two pins *p p*. In consequence of the arrangement and interconnection of the coils, the direction in which the suspended coil tends to rotate is counter clockwise,

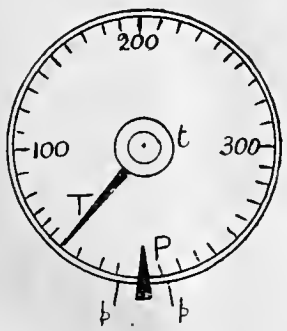

Fig. 69.

and by turning the torsion index in the clockwise direction through a certain angle sufficient torsion is given to the spring, so that the couple exerted by it just balances the couple exerted between the current-carrying coils, and the movable coil is brought back to its initial position—*i.e.*, the pointer P points to zero. Now, the action between two adjacent current-carrying coils traversed by currents is mutual, and the couple is simply proportional to their magnetic moments, and therefore to the *product* of the currents passing through them. Moreover, the moment of the couple exerted by the spring is simply proportional to the angle through which the torsion index is turned, or, in other words, to the angle of torsion, and it is thus clear that *the angle of torsion is a measure of the square of the current*, since the same current passes through each coil. Hence the value of the current is given by the formula:

$$C = K\sqrt{\theta},$$

Where C = the current in ampères.

K = a constant depending on the construction of the instrument and the spring used, and which may be determined by experiment.

θ = the angle of torsion when equilibrium exists between the two couples. In other words, it is the torsion which must be given to the spring to keep the suspended coil at zero.

In order to increase the range of this instrument, or, in other words, to enable the same instrument to measure currents differing considerably in magnitude, each instrument is provided with two distinct and separate fixed coils. One of these consists of a few turns of thick wire, and is used for the measurement of heavy currents, whilst the other, consisting of five times as many turns of finer wire, is used for the measurement of smaller currents. To use either of these coils as may be desired, the instrument is provided with three terminals, the middle one being a common connection to both coils. With each instrument there is supplied a table of values, giving the magnitude of the current corresponding to each division of the scale, so that the current is determined directly without making any calculation. The electro-dynamometer may be used for alternating currents, as well as for continuous currents, and this, it will be observed, is a great advantage.

Voltmeters.—We have already pointed out how essential it is that the proper electrical pressure should be generated and maintained in a circuit supplying energy for lighting purposes. It is,

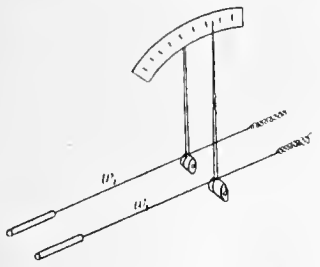

Fig. 70.

therefore, a matter of much importance to be able to determine readily the pressure between different points in a circuit, and for this purpose voltmeters are used. In the majority of the voltmeters used the electro-magnetic principle is employed, and the working parts and construction are identical with those explained under the head of ammeters in Article XVIII. As a matter of fact, electro-magnetic voltmeters are ammeters calibrated to indicate electrical pressures. When we remember that, according to Ohm's Law, $C = \frac{E}{R}$, it will be obvious that if R is constant, the current C will be proportional to the pressure E, sending the current through the resistance R of the instrument—that is, the deflection produced by the current is a measure of the electromotive force at the terminals of the instrument. It must, however, be pointed out that ammeters depending on electro-magnetic action are low-resistance instruments, being usually wound with few turns of thick wires, so as not to produce any appreciable loss of pressure, from which it is clear that voltmeters should be high-resistance instruments; they are therefore wound with many turns of fine wire, and this is practically the only difference in the construction of voltmeters and ammeters of this class of instrument. At the same time it is essential that voltmeters should not waste an undue amount of energy, and fortunately very little current—only a fraction of an ampère—passes through the instrument; and, unlike ammeters, voltmeters are connected across the mains of a circuit—*i.e.*, between the points

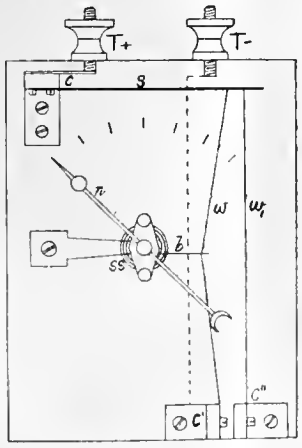

Fig. 71.

between which we desire to determine the pressure, and not in the main circuit. This is, of course, connecting the voltmeter as a shunt across the part of the circuit to be measured. So far no mention has been made of instruments depending upon the heating effect of a current, although the temperature of a wire traversed by a current is always raised to a greater or less degree, the amount of heat which is produced being readily calculated by means of the formula $H = C^2 R t \times 0{\cdot}24$, in which H is the number of units of heat (calories) developed, C the current in ampères, R the resistance in ohms and 0·24 is a constant connecting these quantities together. From this formula it is obvious that hot-wire instruments are altogether unsuitable for use as ammeters, since ammeters are traversed by the full current. As voltmeters, however, hot-wire instruments possess certain advantages. The currents passing through them are small, and since it is desirable they should have considerable resistance fine wire may be used, in which case an increase of temperature results with very little loss of heat, and the accompanying expansion of the wire produces sufficient elongation to indicate the magnitude of the current passing, and therefore the electro-motive force sending the current through the wire. They are, moreover, specially adapted for measuring alternating currents, and the same hot-wire instrument may be used on both direct and alternating current circuits. There are, however, several sources of error in hot-wire instruments, and the following descriptions explain how these instruments may be made reliable.

In Fig. 70 a diagrammatic figure is given of

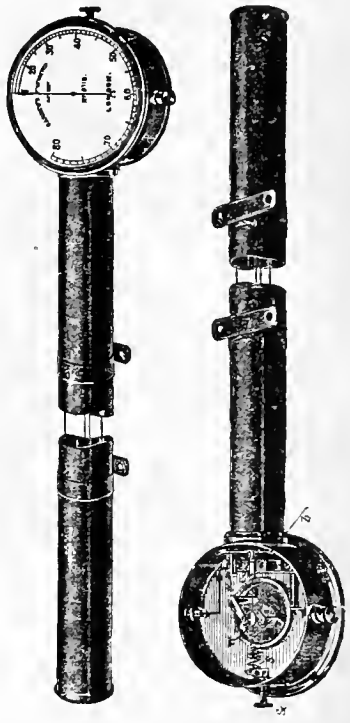

Fig. 72.

one of the earliest practical forms of hot-wire instruments introduced by Mr. G. M. Hopkins. As will be observed, there are two fine wires, *w* and w_1, and these are exactly similar and of the same material. The wires are arranged as shown, so that the one *w*, which carries the current, will move the index finger when expansion occurs, whilst the other, w_1, which is not traversed by the current, moves the dial should expansion occur. This arrangement compensates for all variations of the temperature of the surrounding air, so that the actual reading indicates the difference of the temperatures of the two wires, and not on the absolute temperature of *w*. The difference between the temperatures of the two wires is obviously due to the current passing through *w*, and in this way the expansion of this wire enables the current to be measured.

Another interesting hot-wire voltmeter, known as a *cell-tester*, and introduced by Holden, is shown in Fig. 71. Since the E.M.F. given by a single secondary cell or accumulator varies from 2 to 2·5 volts, this instrument has been designed to measure small pressures. From the figure it will be observed that two fine wires, *w* and w_1, of the same material and size, are connected to a spring, S, fixed horizontally at the top of the instrument, and to two separate angle-pieces, C' and C'', fixed at the bottom of the instrument, and C'' is insulated. C' is connected by means of a conductor (shown dotted) to the terminal marked (T −). The spring S is supported by the angle-piece C,

which is connected directly to the terminal (T+). It is thus evident that only the wire w can be traversed by a current, the second wire w_1 being introduced to compensate for variations of the temperature of the surrounding air. Since both wires are stretched tightly between the spring S and the angle-pieces C' and C'', any sag in the two wires resulting from expansion due to variations of temperatures externally, will be taken up by the spring S, and the needle of the instrument will not be affected. But when the wire w is heated by the passage of a current through it, it expands more than w_1, and a certain amount of sag results. This is taken up by the hair-spring $s\,s$, and the bar b connected to the wire w, and the needle n is free to rotate a certain amount. Since the spring S is prevented from taking up any of this sag, in consequence of the tension of the wire w_1, it is clear that the controlling force of the instrument is supplied by the spring S. The arrangement of the hair-spring $s\,s$ and the needle n is such that the needle tends to rotate. But this is not possible under normal conditions, and the deflection of the needle is a measure of the difference of the temperatures of the wires, and therefore of the current passing along w. The current passes from terminal to terminal along the spring S and wire w. The needle may be adjusted to zero by means of a small thumb-screw.

The chief of the hot-wire voltmeters is that of Cardew's, shown in Fig. 72. In this instrument a long length (13ft.) of fine platinum-silver wire —0·0025 of an inch, or 2½mils. in diameter—is used. This wire is fixed at one end to a small fixed brass block, b, from which it is led round a grooved insulated pulley fixed at the other end of the brass tube. It then returns, and passes round a small insulated pulley, c, and back again to pass round a second grooved insulated pulley at the end of the tube, finally terminating at the brass block b'. These blocks are insulated from the case by pieces of vulcanised fibre, and are also connected to the two terminals of the instrument by pieces of copper wire, as shown. The spindle carrying the two pulleys at the end of the brass tube is pivoted in jewelled holes, so that the friction is reduced to a minimum, and it is necessary that the wire should pass round these two pulleys in such a way that they rotate in the same direction when the sag is taken up by the movement of the pulley C, which does not rotate. The pulley C, it will be observed, is attached to a brass strip, which is connected by a fine platinum-silver wire to the spiral spring S. This spring keeps the wires stretched tightly, and the tension of the spring may be varied by means of the adjusting screw Sc. When a difference of potential is maintained between the terminals of the instrument, a current traverses the platinum-silver wire, and since the resistance of this wire does not vary greatly, the current is proportional to the pressure maintained at the terminals. The current raises the temperature of the wire, which expands, and since the wire is very thin, the temperature corresponding to the current passing is quickly attained and very little heat is lost. The elongation produced is taken up by the spring S, which pulls down the wire (passing round the double-grooved wheel W) connected to the pulley C, and the wheel W turns on its spindle, which also carries a toothed wheel geared into a small pinion. Attached to the spindle carrying this pinion, but in front of the instrument, is the pointer capable of moving over a dial graduated in volts, and the gearing is so arranged that for a small elongation of the wire there is considerable movement of the pointer. A moment's consideration will suffice to show that the movement of the pulley C is due to the expansion of only half the total length of the wire used. The same result would be produced if only half the total length of fine wire were used; but there is the advantage that by using the greater length of wire the section may be smaller (for the same spring S), so that the fine wire heats and cools more rapidly than a thicker one, and the voltmeter is more dead-beat in its action.

In addition to the advantage of being able to measure the pressures of alternating currents as well as those of continuous currents, this instrument possesses the advantage of having no heating error, inasmuch as the heating effect of the current is the property utilised. It, however, absorbs a good deal of energy, and cannot be used for measuring small differences of potential.

(*To be continued.*)

SANITARY WORK.—II.

WATER-WASTE PREVENTERS.

FLUSHING appliances for water-closets, urinals, housemaids' slop-sinks, &c., can be obtained in almost endless variety, and it is therefore necessary to exercise a certain amount of discrimination in their selection.

In most towns the water company make it

Fig. 12.

Fig. 13.

compulsory that the flushing apparatus to a water-closet shall take the form of what is known as a "water-waste preventing cistern," and frequently will only permit certain approved patterns to be used. The discharing capacity of the waste-preventer is also generally limited to two gallons on each occasion that the closet is flushed with water.

As a general rule the waste-preventing cistern is placed directly above the closet at a height of 7 or 8ft. from the floor. The 1½in. diameter lead flushing pipe should be connected to the flushing arm of the closet by means of a stout indiarubber cone, and well secured with copper wire. Illustrations of the indiarubber cones or connectors used for this purpose are seen in Figs. 12 and 13.

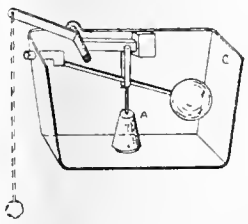

Fig. 14.

The former being known as a "straight" cone, and the latter as a "bulged" cone.

Waste-preventing cisterns are broadly divisible into two classes—viz., those which depend for their action on the opening or closing of one or more valves, and those which are entirely valveless. The contents of the latter description are usually arranged so as to be discharged by siphonic action on pulling a handle.

Before referring more particularly to the *siphonic action* flushing cisterns or water-waste preventers, which are now so largely used, the class of flushing cistern in which the supply of water to the closet or other fitment is regulated by one or more valves will first be noticed.

Fig. 14 is an illustration of what is known as a "single-valve waste-preventing cistern." On pulling the handle, the dead-weight valve A is raised so that the water within the cistern rushes

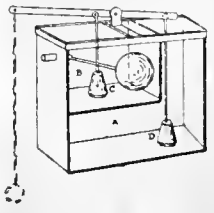

Fig. 15.

down the flushing-pipe and flushes the closet-basin. It will also be observed that by the same action of the lever the ball-valve is closed, so that should the cistern handle be held or fastened down, only the contents of the cistern (generally about two gallons) can be discharged, and no more water will be supplied until the handle is released and the dead-weight valve closed.

For the purpose of emptying cisterns of this description, and so obtaining the maximum flush which they provide, it is absolutely necessary to hold down the handle during the whole time. The result is that in the majority of cases where this type of waste preventer is used, the closet basin is insufficiently flushed, as the volume of water passing during the short time the handle is held is quite inadequate to properly remove the faeces and paper from the drains. Such an economical use of water may be advantageous to the water company, provided the cisterns continue in good working order; but, on the other hand, should the apparatus be in any way defective, a very serious waste may take place without being noticed or remedied for a considerable time. For instance, if the valve does not sit tightly upon its seating, a small stream of water will be continually running through the flushing pipe, probably quite unobserved.

The flushing cistern shown in Fig. 15 is known as a "double-valve waste-preventer." The cistern is divided into two compartments, A and B, one of which is connected directly with the flushing pipe, whilst the other contains the ball-valve. An opening is arranged between the two chambers, which is governed by the dead-weight

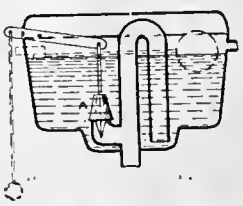

Fig. 16.

valve C. The water supply to the flushing-pipe is regulated by means of the valve D. When the cistern is not in use, both chambers of the waste-preventer are full of water. The apparatus is so arranged that when the handle is pulled the valve D is raised whilst that at C is tightly closed. So long as the handle is depressed, the water from the compartment B passes down the flushing-pipe to flush the closet-basin; but no further supply of water can pass from the chamber A until the handle is released. When this takes place the valve D is closed, and that at C is opened, so that the chamber B is again quickly filled with water. These waste-preventers are subject to the same disadvantages as those already mentioned in connection with single-valve waste-preventing cisterns.

It will be observed that neither the single or the double-valve waste-preventer shown can be

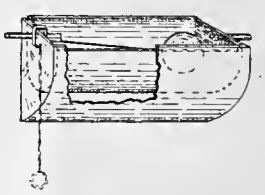

Fig. 17.

used with valve closets, as no "after-flush" is provided in order to recharge the basin with water when the closet valve is closed. Attempts have been made to overcome this difficulty by providing an additional small chamber or box at the bottom of the waste-preventing cistern, and which is known as a "trapping-box." The trapping-box is so designed as to retain a small quantity of water (about half a gallon) when the cistern is being discharged, and afterwards to allow the retained portion to slowly trickle down the flushing pipe and remain within the closet basin. Should, however, the handle be held up too long, the dribble of water intended for the after-flush runs away, and the closet basin is left quite dry.

Another form of valve waste-preventing cistern which provides a distinct after-flush is also sometimes used. In this instance the cistern is divided into *three* compartments, and arranged with *four* separate valves. In one compartment the ball-valve is placed; whilst the other two respectively contain the specified quantity of water required for the flush and after-flush. When the handle is raised, the water within the flushing compartment is discharged; but no further allowance of water can pass into the basin until the handle is returned to its normal position. The water retained within the after-flush compartment is then immediately discharged to provide the necessary

pool within the basin. Waste preventers of this latter description are, however, far too complicated for ordinary purposes, and are constantly liable to get out of order, besides being difficult to repair.

Many descriptions of water waste-preventing cisterns are provided with a valve so arranged as to set up siphonic action, and thus rapidly discharge the entire contents of the cistern without the necessity of holding down the handle

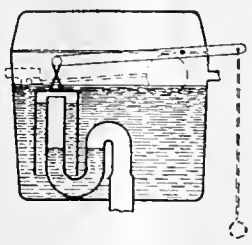

Fig. 18.

during the whole period of discharge. Fig. 16 is a sketch of a waste-preventing cistern of this class. When the handle is pulled, the dead-weight valve A is immediately raised, so that a quantity of water rapidly passes down the flushing pipe and at the same time withdraws the air from the discharging leg of the siphon. By this means siphonic action is directly set up within the siphon, and a full and complete flush is obtained. As in the case of all cisterns provided with valves, a great waste of water may take place, should the valve at any time become worn, or sit improperly upon its seating.

Numerous varieties of *valveless* water-waste preventing cisterns—good, bad, and indifferent—have been introduced from time to time, most of

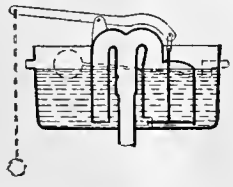

Fig. 19.

which utilise the principle of siphonic action in one way or another. For water-closets and housemaid's slop-sinks, this action is generally put in motion by simply pulling a lever or handle; but for urinals, &c., the waste-preventers are more frequently arranged to discharge automatically at regular intervals.

In addition to the various siphonic action water-waste preventers now in the market, there is another type of *valveless* waste-preventing cistern manufactured to which a brief reference may be made. These are known as "tipping," or "revolving water-waste preventers." The general principle of construction is indicated in Fig. 17. A small revolving basin or "tipping box" is accurately pivoted inside the ordinary cistern, which is filled with water by means of the usual ball-valve. On pulling the handle, the

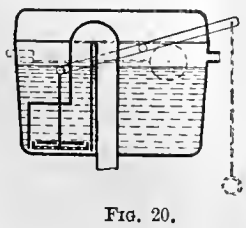

Fig. 20.

tipping box is overturned, so that the water is discharged into the outer cistern, and from thence into the flushing pipe.

Automatic revolving water-waste preventers may also be obtained, in which the tipping-box is so arranged that directly it is full the weight of water overturns it and the contents are immediately discharged. They may be fed by the smallest dribble of water. Revolving water waste-preventers are, however, not much used, as the noise and splashing of water renders them objectionable.

Fig. 18 shows a well-known form of *valveless siphonic-action* cistern or waste-preventer. It consists of a siphon provided with a trapped arm, the lever or handle being attached to the movable cap, as indicated in the sketch. By pulling the handle the cap is raised, together with the water contained within the annular space, which, falling in comparatively large volume down the vertical pipe, starts siphonic action and rapidly discharges the contents of the cistern.

Some water companies insist upon the crown or bend of the siphon being so arranged as to be *above* the level of the top of the cisten, so that any risk of the water wasting and dribbling away unobserved through the siphon itself may be entirely prevented. Under such circumstances, the waste-preventer just described cannot be used.

Figs. 19, 20, 21, 22, and 23 are typical illustrations of *valveless* water-waste preventing cisterns in which the crown of the siphon is placed *above* the level of the top of the cistern. In each case it will be seen that a quantity of water is in the first instance mechanically forced through the siphon in order to start the siphonic action. They are accordingly sometimes known as "displacer-started siphonic-action cisterns." The different means adopted for mechanically

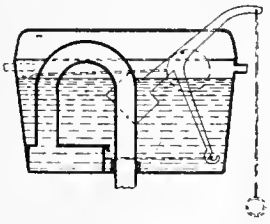

Fig. 21.

displacing the water, so as to bring the siphon into action, will be readily understood on reference to the illustrations. In Fig. 19, the act of pulling the handle lifts the plunger (or water displacer) attached thereto, and forces a quantity of water into the descending arm of the siphon, bringing it immediately into action.

A modification of the same mechanical movement is shown in Fig. 20. The water is first lifted over the crown of the siphon by means of a loose metal disc, and the siphonic action started.

Fig. 21 illustrates a water waste-preventer, in which the plunger is given a horizontal movement. This is connected to the handle by means of a cranked lever weighted at one end.

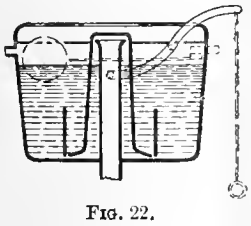

Fig. 22.

Pulling the handle, the plunger is thrust forward, driving the water before it into the siphon, and so setting it in action. The plunger remains in this position until the contents of the cistern are discharged, when it returns to its original position, being forced back by the weighted lever attached thereto.

The valveless, siphonic-action waste-preventer shown in Fig. 22 is illustrative of what is known as the "pull-and-let-go" type. When the handle is depressed, the movable cap of the siphon is raised; but the water within the annular space is not lifted, owing to the absence of any trap or seal on the outlet or discharging arm of the siphon. As a consequence, so long as the handle is held down, siphonic action cannot take place, nor can any water escape; but directly it is released the cap descends (in consequence of its weight) and forces the water before it into the discharging arm, thus setting up siphonic action.

Another arrangement is shown in Fig. 23. In this case the cap, when in its normal position, is raised to a certain level by means of a weighted lever. On pulling the handle the cap is forced downwards into the well in which it works, the water being at the same time driven into the long arm of the siphon in sufficient volume to start it.

When ordinary siphonic action water-waste preventing cisterns must of necessity be fixed near living or bedrooms, they are frequently found to be very objectionable on account of the loud gurgling noise which occurs at the conclusion of each siphonic discharge. This is due to the siphon drawing in both air and water towards the end of the action. Under such circumstances the closet cannot be used without

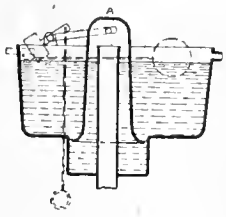

Fig. 23.

the fact being made perfectly audible to every person in the immediate vicinity. To remedy this defect, various contrivances have been designed. Amongst others that might be mentioned, the waste-preventer just illustrated (Fig. 23) can be obtained with a noiseless arrangement. A valve with a weight and float is attached to the cap or dome of the siphon at A. When the cap is pulled down in order to start the siphonic action, the weight keeps the valve closed; but when the water-level in the cistern falls below the float, the valve is opened, and air is admitted into the *top* of the siphon, thus preventing the noise which would otherwise be caused by drawing in air and water at the bottom.

Automatic flushing cisterns are usually provided to urinals, latrines, &c., and may be obtained in great variety. As regards the general principles of construction, they are practically the same as

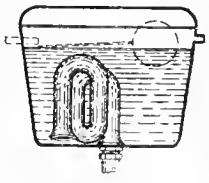

Fig. 24.

those of larger size, which are used for flushing drains. The action of the automatic siphonic flushing-cistern, shown in Fig. 2, has already been explained.

Fig. 24 is the sketch of another well-known automatic siphonic-action flushing-cistern. Essentially, it consists of a siphon with a trapped arm, so arranged that immediately the water-level attains a sufficient height, or head, above the crown of the siphon, the confined air is forced out and siphonic action set up. A reversible ball-valve must be used with this cistern; in fact, it is a safe general rule to provide a reversible ball-valve to all automatic siphonic-action flushing-cisterns.

Most water companies insist upon some form of

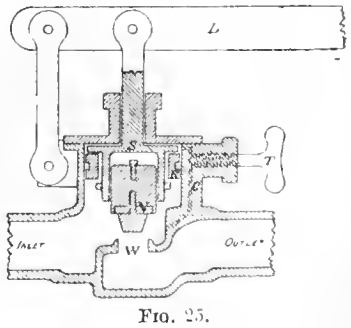

Fig. 25.

water-waste preventing cistern being used for flushing closets, &c.; but where this is not compulsory, a type of fitting known as a "waste-preventing closet-valve" is sometimes substituted. On lifting a handle, the valve (which is usually fixed on the flushing-pipe immediately under the closet-seat) is opened, and a certain quantity of

water allowed to pass for flushing purposes. So soon as the prescribed quantity of water has passed, the valve closes, even though the handle be kept raised.

Fig. 25 shows the general arrangement of Tylor's patent waste-preventing closet-valve. The plunger or valve V is so arranged as to be perfectly free to move up and down within the carrier or socket S, which is attached to the lever L by means of a short connecting-rod or spindle. The descent of the socket is capable of being controlled by the loose ring R. A small passage or channel C allows the water to flow from the under to the upper side of the ring, which can be regulated by means of the tap T.

The action of the valve is as follows:—On lifting the closet-handle, the socket S is correspondingly raised, whilst at the same time the valve V and the ring R also ascend by suction. If the handle is then released, the carrier or socket gradually commences to fall, the velocity of its descent being controlled by the quantity of water which is permitted to pass to the upper side of the ring R, through the channel C. Should the closet-handle be kept raised, then neither the

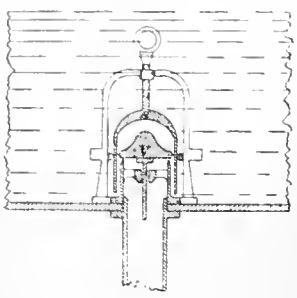

Fig. 26.

socket S nor the ring R can descend; but the valve V—being perfectly free—will slowly fall by means of its own weight and the pressure of water until it rests upon its seating W, thus cutting off the water-supply to the closet.

Another type of "water-waste preventing valve" is also sometimes used. It is intended to be fixed under water, and within the cistern supplying the closet. Fig. 26 is a sketch of a well-known patented form of "waste-preventing cistern-valve." The principle of construction is essentially the same as the waste-preventing closet-valve just described. When the closet-handle is raised, the carrier or socket S is lifted, and at the same time the loose plunger or valve V is carried upwards by suction, thus allowing the water in the cistern to escape down the flushing-pipe. On releasing the handle the socket descends, and the valve V returns to its seating. If the handle is kept raised, the carrier or socket is also held up, but the loose valve V gradually descends by its own weight and the pressure of water until it falls upon its seating. By this means the supply of water to the closet is shut off directly a certain quantity of water has passed.

USEFUL ITEMS FOR BUILDERS, PLASTERERS, PAINTERS, PAPER-HANGERS, &c.

(*Concluded from page 340.*)

66. To fix glass letters on shop-fronts: Make a thick solution of marine glue in wood naphtha, and apply this to the glass surface after having cleaned same.

67. Cement for fastening glass and metals together: Glass can be made to adhere to any other substances by means of a mixture of gum arabic and calomel (mercurous chloride). Digest best quality gum arabic in water until a mucilage as thick as treacle is made, and stir into it sufficient calomel to make a sticky mass, and mix up in a plate with a bone spatula. Make only just as much as is required for use. Allow the compound a day or two before use, but it may be used directly it is mixed. This cement hardens in a few hours.

68. The usual cement for affixing metal letters to glass shopfronts is prepared by melting together up to the heat of a waterboil, 15 parts fluid measure) of copal varnish, 5 parts (ditto) drying oil, 3 parts (by weight) of Venice turpentine, 2 parts (fluid measure) of oil of turpentine, and five parts of liquefied marine glue, and to the melted compound add 10 parts (by weight) by slaked lime.

69. A very secure and quick-drying cement for identical purpose is prepared by boiling 3 parts of boiled linseed oil with 1 part of white-lead and 2 parts of litharge (both in powder), and then adding 1 part of copal resin powdered, and continue the heating until the resin is melted.

70. A waterproof cement for the same purpose is prepared by melting 4 parts of glue in the least possible quantity of water, and then adding 1 part of Venice turpentine.

71. Glue for joining wood to stone or glass: Mix dry wood ashes (beech ashes preferable) with ordinary glue at boiling point until the mixture is of the consistency of thick syrup. Use while hot.

72. A cement for uniting transparent objects (such as glass letters in shop windows): Make a solution of acid chromate of lime in water, and use 1 part of the solution to 5 parts of softened gelatine. The chromated gelatine will harden to an insoluble cement when exposed to light.

73. Glue for fastening leather, leatherette, &c., to walls: Mix 20 fluid ounces of rye whisky with the same quantity of water, and then stir in 4½ ounces of powdered starch to make a thick paste: separately dissolve 1¼ ounce of good glue in an equal weight of water, and melt this by heat; then stir in 1¼ ounces of Venice turpentine in the glue solution, mix thoroughly, and then mix the glue and starch and compound together and well incorporate.

74. A cement for uniting guttapercha connections of electrical apparatus is made by melting together by heat 1 part of tar, 1 part of rosin, and 3 parts of guttapercha.

75. Another cement for the same use is made by dissolving 2 parts of common pitch with 1 part of guttapercha by heat. Make the mixture in a saucepan, and when fluid pour ont into cold water. When cold it is a black elastic solid, but readily softened by heat, and at 100° Fahr. it is a thin fluid. It may be used in either fluid or solid state—in the latter case, just as putty is used.

76. Cement for affixing leather to various materials: Dissolve 20 parts of guttapercha and 20 parts of black pitch in 3 parts of oil of turpentine.

77. A cement for the same purpose is made by dissolving guttapercha in bisulphide of carbon until it is of the consistency of treacle.

78. A ditto cement is made by melting together in two parts of linseed oil 16 parts of guttapercha, 4 parts of indiarubber, 2 parts of colophony, and 1 part of shellac.

79. Gasket for putting between manholes and other removable parts of steam boilers, hot-water apparatus, &c., is made by mixing the following ingredients to a stiff putty:—10 parts of graphite (or plumbago), 3 parts of whiting, 3 parts of litharge in sufficient linseed-oil varnish.

80. Cement for joining indiarubber connections of electrical apparatus: Dissolve in sufficient bisulphide of carbon 10 parts of indiarubber chopped up small, 1½ part of rosin, and 1 part of shellac.

81. To glue leather to iron: Melt equal parts of asphaltum and guttapercha. Apply hot, and put under pressure until dry.

82. Cement for hot-water and steam-pipes: Compound: 10 parts of white-lead ground in oil, 3 parts of black oxide of manganese, and 1 part of litharge.

83. Another cement for a similar use is prepared by mixing 6 parts of dried clay and 1 part of iron filings in boiled linseed oil, so as to make a paste.

84. A cement for repairing cast-iron tanks is prepared by melting at a low heat (so as to prevent the brimstone catching fire) 5 parts of brimstone, 2 parts of blacklead, and 2 parts of sifted cast-iron filings. Before applying this cement, warm the metal by laying a red-hot iron over it. The metal must be perfectly dry, so as not to generate steam, and then stop up the damaged part with the cement applied in a soft state by gently heating it in an iron ladle.

85. Cement for affixing leather, paper, &c., to iron girders, pillars, &c.: Make some carpenter's glue in the usual way, and then stir in pure tannin until the glue becomes ropy, and spread this on the cloth and metal. If the iron has a polished surface, first coat the smooth surface with a coating of white-lead; and when that has dried hard, give a coating of Russia glue dissolved in water, to which has been added a little vinegar.

86. To fasten copper in sandstone, rub up 4 parts of linseed oil and varnish, 7 parts of white-lead, 6 parts of litharge, 6 parts of bole, and 4 parts of broken glass.

87. To repair cracks in ovens, mix into a paste with water when about to use it a compound composed of 2 parts of litharge, 1 part of fine sand, and 1 part slaked lime.

88. To attach fibrous material to metal, soak good glue in water for 12 hours, and then dissolve the softened glue in hot vinegar, and add one-third of its volume of white-pine pitch, also hot.

89. A cement for gasfitters' use: melt 9 parts of rosin and 2 parts of beeswax, and then stir in 6 parts of red ochre or other red oxide of iron.

90. Cement for cracks in hot-water pipes: Mix 1oz. of powdered salammoniac with 100z. of iron borings, and ram them well into the crack or joint; or else mix 12lb. of iron filings, 2oz. of salammoniac, and 1oz. of sulphur, worked up in water.

91. To cement iron to stone: Mix together one part of iron filings and seven parts of plaster of Paris (by weight both ingredients) and make into a paste with water; use at once.

92. To repair cracks in iron grates, mix to a stiff paste five parts of wood ashes, five parts of clay, and two parts of burnt (quick) lime.

93. To cement iron railings, girders, &c.: Mix together six parts of sulphur, six parts of white-lead, and one part of borax; then, when wanted for use, moisten it with strong sulphuric acid, and place a thin layer of it between the pieces of iron which are to be joined. In five or six days the cemented pieces will be firmly attached.

94. To protect iron structures from rusting mix 1 part of quicklime with 5 parts of water, stir it up to allow the lime to settle; then pour off the clear water, and mix the lime with sufficient olive-oil to make a thick cream, and paint this over the iron surfaces to be protected.

95. To fix metal letters on glass mix 3 parts of copal varnish, 1 part of linseed-oil varnish, 1 part of oil of turpentine, and 1 part of liquefied glue; or else this compound, which is suitable for fastening metal letters on any material: melt together 15 parts of copal varnish, 5 parts of drying oil, 2 parts of oil of turpentine, 5 parts liquefied glue, made with the least possible quantity of water; when the mixture is well stirred put in 10 parts of fresh slaked lime that is perfectly dry.

96. To repair broken stone, prepare a powder and a liquid as follows: mix and grind 2 parts (by weight) of oxide of zinc, 2 parts of crushed limestone of a hard nature, and 1 part of crushed grit, and add ochre in suitable proportions to colour the mass. To prepare the fluid, make a saturated solution of zinc in commercial hydrochloric acid, and add thereto hydrochlorate of ammonia equal in weight to one-sixth of the dissolved zinc, and dilute the mixture with two-thirds of its bulk of water. To use the liquid, mix 1 part of the powder compound with 2½ parts of this liquid.

97. To cement steam pipes, make into a paste 8 parts of native or else precipitated sulphate of barium, 6 parts of graphite (or plumbago), 3 parts of slaked lime, and 1 part of boiled linseed-oil.

98. Putty for steam-pipes: Mix 2 parts of a good metallic paint, 1 part of litharge, and 3 parts of dry iron borings (or filings) with sufficient linseed-oil to make a stiff putty.

99. Putty for repairing broken stones (the heat will harden this cement). Reduce the following ingredients to powder. Mix all together in a mortar and make into a thick putty with water just before use: 10 parts of clay, 4 parts of fine iron filings, 2 parts of peroxide of manganese, 1 part of common salt (sodic chloride), and 1 part of borax.

100. A cement for a similar purpose that will resist a very high temperature is prepared by making into a paste with solution of silicate of potash and borax 1 part of sulphate of barium and 2 parts of clay.

101. Cement for water-pipes: Mix 5 parts of zinc white, 4 parts of pyrolusite, and 1 part of sodium silicate.

102. A waterproof glue is prepared by adding 4 parts of common rosin to 4 parts of hot glue, and stirring in 1 part of red ochre.

103. A glue for universal use is made by stirring dry powdered chalk with common glue.

104. To keep glue elastic, and free from cracking, add a little chloride of calcium to the glue made in the usual way; a little glycerine also has the same effect, but not too much must

be used, or the glue will attract moisture, and be non-adherent.

105. A putty for mahogany is prepared by melting 4 parts of beeswax and whiting in 1 part of Indian red, and 1 part of yellow ochre or shellac may be melted and coloured with these pigments, and used for the same purpose.

106. Common putty is made by mixing thoroughly dry whiting with raw linseed oil. A little dry white-lead may be added as well as ochre to colour the putty.

107. A good floor putty is prepared by melting 1 part of glue in 8 parts of water, and then stir in 1 part of litharge, 2 parts of plaster of Paris, 4 parts of curds (from curdled milk), and 2 parts of sawdust. If the floors are to be varnished, dissolve 1 part of glue in 6 parts of water, and then work in 2 parts of plaster of Paris, and 1 to 2 parts of litharge.

108. An imperishable putty is prepared by boiling 4 parts (by weight) of brown umber in 7 parts (by measure) of linseed-oil for two hours. Then melt in two parts of wax, and afterwards stir in 5½ parts of powdered chalk and 11 parts of white-lead, and thoroughly incorporate the whole.

109. Putties for cracks and joints: Mix 2 parts of glue in 1 part of water, and then stir in 7 parts of cement and 3 to 4 of sawdust; or else mix 1 part of powdered slaked lime with 2 to 5 parts of rye flour, and make into a putty with 1 part of linseed-oil varnish, and thin the mass with sufficient water to make it thin enough for use.

110. Russian glue is made by soaking 100 parts of good glue in 120 to 140 parts of water, and melting by heat, then adding 5 to 6 parts of nitric acid, and afterwards 6 parts of sulphate of lead in powder.

111. Glue for green or damp wood is prepared by soaking good glue in water until soft; then dissolve it in the smallest possible quantity of proof spirit by the aid of a gentle heat. In every pound of this mixture dissolve 3oz. of gum ammoniac, and while liquid add ½fl.oz. of rectified spirit of wine; stir well, and for use keep it liquid by standing the vessel in hot water.

112. Glue for veneers: Dissolve a good quantity glue in water, and to every pint of this solution add 5oz. best vinegar and ½oz. of isinglass.

113. A marine glue is prepared by dissolving 1oz. of unvulcanised indiarubber in 20fl.oz. of coal naphtha; then rub it smooth on a slab with a spatula or palette knife, and add at least enough to melt two parts shellac by weight to one part of this solution. Heat this compound to 250° Fahr. when using.

114. Glue for damp walls that are to be papered: Dissolve one part of asphaltum by heat, and add 1 part of rosin, and then stir in 2 parts of powdered whiting. Separately dissolve 2 parts of caoutchouc in 4 parts of oil of turpentine, to which 2 parts of bisulphide of carbon has been mixed. Then mix these two compounds (the rubber and glue solutions) by heating at a gentle warmth. Cleanse the wall by scraping, and then brush on the above compound on the damp places, and before the glue is dry put on plain paper, over which, when dry, put on the wall-paper.

115. To make common glue waterproof add a little tannic acid dissolved in water to the hot glue.

116. Paperhanger's paste: Mix powdered alum into the flour before mixing in the parts to the proportion of 13 of alum to every 666 of the flour. Instead of alum, powdered rosin may be mixed in the paste after having made it in the usual way. The rosin should be strewn in the paste while it is boiling hot, so as to cause the rosin to dissolve.

117. To fasten tapestry and textile hangings on walls, &c.: Make a paste of rye-flour, and then stir in good glue in the proportion of 1 part glue to 4 parts of flour originally taken. The glue should be melted in the usual way before being mixed with the paste. A few drops of carbolic acid or essential oil of cloves will prevent this compound decomposing or putrefying.

118. Modelling paste for architects and draughtsmen: Boil white paper to a pulp by boiling it in water for four to five hours. Then pour off the water, and pound the paper in a mortar; pour it through a sieve, and mix with some gum water or isinglass glue.

119. Red-lead cement is made by mixing red-lead with linseed oil to a paste, and is used by plumbers, gasfitters, and for metal pipes.

120. Plaster for insulating steam-pipes: Puddle some clay in water to a thin fluid mass, and then mix in felt, cork waste, chopped straw, or asbestos, so as to make a stiff compound, and plaster this on the pipes while moist. To prevent this compound cracking and falling off, mix infusorial cement with silicate of soda or of potash, so as to form a fluid of the consistency of paint, and then brush this over the insulating layer of clay, and when dry give a second or third application, and finally a coating of drying oil may be given to prevent efflorescence of the silicate.

H. C. S.

THE SURVEYORS' INSTITUTION.

At the ordinary general meeting of the above Institution on Monday evening last an interesting paper was read by Mr. Harley M. Grellier on "Tithe Rent-Charge Recovery," dealing especially with the changes which the Act of 1891 had made in the procedure under the Tithe Commutation Act of 1836. Under the older Act, tithes were, with certain exceptions, discharged, and for payment in kind or in the form of a voluntary composition, was substituted a rent-charge, fluctuating annually with the average prices of wheat, barley, and oats, calculated on the average of the seven previous years, in order to avoid too sudden fluctuations in good or bad seasons. This sum was payable in half-yearly portions, and was recoverable by distress and entry, it being expressly provided that no one should be personally liable for the payment, and that not more than two years' arrears should at any time be recoverable by distress. Although tithe rent-charge was regarded as an owner's liability, the tenant was given power to deduct from the rent the sum paid by him, as part of the consideration on which he held the land, and it became the custom for the tenant so to pay it direct. There were good reasons for this, for where the land was let tithe free, and the landlord neglected to pay it himself, the goods of the tenant were liable to seizure as the only tangible security of the tithe owner. The agitation in Wales, due to various political and other causes, hastened the passing of the Tithe Act of 1891, which introduced an entirely new method of procedure, and, starting with the fact that tithe rent-charge is a liability attached to the land, it provided that it should be payable by the landowner in every case, notwithstanding any contract or agreement to the contrary; and that where any sum due on account of rent charge is in arrear for not less than three months, the person entitled to it might apply to the County Court for an order for its recovery, either by distraint on the lands when they are in the occupancy of the owner, or the appointment of a receiver of the rents and profits in every other case, due notice and the opportunity of appearing and being heard being given. In cases of contracts entered in before 1891 for the tenant to pay the charge, he is bound to pay it, but to the landowner, and not direct to the tithe owner. In the case of lands of one owner situate in different parishes, the Court has power to apportion the charge on them according to their ratable value. The author then dealt exhaustively with the method of procedure under the Act for the recovery of tithe rent-charge which was three months overdue, the service of notices, the fees to be paid in the notice of opposing the application, and the hearing of the case, which, if the application be unopposed, may be decided without a hearing. After a receiver has been appointed by the Court—in the case of lands not in the occupancy of the owner—notice is given to the occupiers to give all particulars required as to their tenancies, and if they refuse to do so they may be compelled by summons to appear as witnesses, bringing the necessary books, papers, and documents in their possession. So much, said Mr. Grellier, depended upon the correct appreciation of the term "owner" as used in the Tithe Act, that it was well to consider its meaning very carefully. "Owners" were not only persons having a fee-simple interest in the land, but included every person in receipt or possession of rents or profits of lands or tithes without regard to their real amount of interest. Tenants for life, or lessees for lives or for a term originally exceeding fourteen years, holding at a rent less than two-thirds of the clear annual value of the premises, are owners, although the persons to whom they pay rent are joint-owners with them. The building lessee holding for a long term is an "owner," and in practice he alone may in most cases be treated as such by an applicant, for in the case of a joint-ownership, service on the owner in possession of the rack-rents is good service on the other owners, and proceedings might be taken against the "owner of the lands" in cases of difficulty, without any name being mentioned on the notice of application. The case of "Peed v. King" decided that the only rents the receiver can take were the rack rents payable by the actual occupiers of the premises. The last Act also introduced the principle of the remission of a certain portion of the tithe under certain circumstances, on the ground that the tithe rent-charge should never be permitted to exceed the profits on the land, the assessment of the land under schedule B of the Income-tax being taken as the gross annual profit, and the net profit being arrived at by deducting one-third to cover repairs, maintenance, and management.

Mr. Grellier proceeded to give many details of costs, tithe redemption, the calculation of the corn averages, cases which had been decided bearing upon the subject, and after a short discussion, in which Mr. J. H. Sabin, Mr. H. C. Newmarch, Mr. C. Gepps, Mr. H. Grimdall, and Mr. Jonas took part, the meeting adjourned.

The next meetings of the Institution will be at Manchester on the 20th and 21st prox.

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXXV.

Provision for expansion and contraction due to changes in temperature has to be made in most structures of considerable linear dimensions. The character of this provision and its extent depends on various conditions, being simple and of slight amount in some cases, and the reverse in others. All work in iron or steel must, however small its dimensions, vary in size with alterations in temperature. But in many instances the effect can be neglected. The natural elasticity of these materials will often suffice to fully compensate for such alterations, due to their yielding, by virtue of that elasticity, into varying curves or cambers, and returning again to normal conditions. This is the case in all arched structures, the effect of expansion being to increase the height of the arch or camber, by a difference corresponding with the increased length of the metal measured round the arc. So long as these extensions are well within the limit of natural elasticity of the material no harm can result. The Forth Bridge cantilevers, though they stand so high over the piers, contain no provision for vertical expansion, because it is taken up by the elasticity of the steel. It may happen in some instances that the increase in the height of an arch might interfere with the level of a roadway, or railway, though the expansions would in themselves be of no moment. For this reason partly, pivoted arches are regarded with favour by many engineers, and several bridges have been built on this principle, the arches being pivoted both at the springings and at the crown. Some large roofs have also been constructed on the same principle. When absolutely linear structures confined at both ends are concerned, then it is necessary to make some provision for expansion, the nature and amount of which will vary. In many cases it is sufficient to put one set of bolts through slot-holes, the slots moving along past the bolts, and the structure sliding on planed plates. The columns of the Kuinza Viaduct in the Alleghanies are free to move in this way. In large roofs, allowance has been made for the expansion of purlins in a similar way, one end of each purlin being attached to brackets on the main spans by means of slotted bolt-holes. In bridges, in some cases broad planed sliding surfaces only are used; but generally, when the movement amounts to an inch or two, rockers are employed; when to several inches, rollers; while when of greater amount, very special arrangements have to be devised, since all cases are not so simple as that of a girder sliding on a plain base.

All lattice bridges of any considerable length are fitted with expansion bearings of one of these types. One end only is fixed, and the other end is generally supported on rollers or rockers which sustain the weight of the free end, and on which it moves during expansion and contraction. There is not much essential difference in the general type on which these bearings are constructed, but the number and details vary widely. Figs. 244, 245, illustrate the fixed, and Figs. 246,

247, the expansion bearings for a bridge over the Nerbudda, belonging to the Indian State Railways.

At the fixed end, Figs. 244, 245, a plate, A, riveted to the bottom boom B receives a broad,

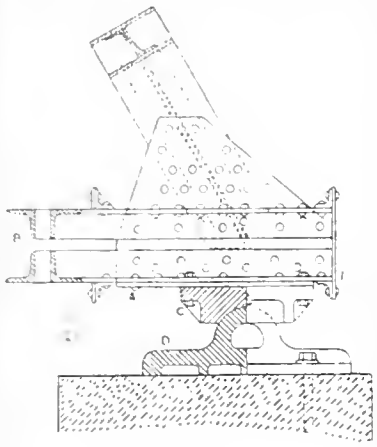

Fig. 244.

stout casting, C, which is recessed out to take a casting, D, bolted down to the pier. There is nothing beside the weight of the superstructure necessary to retain these in place. At the expansion end, Figs. 246, 247, the upper casting C

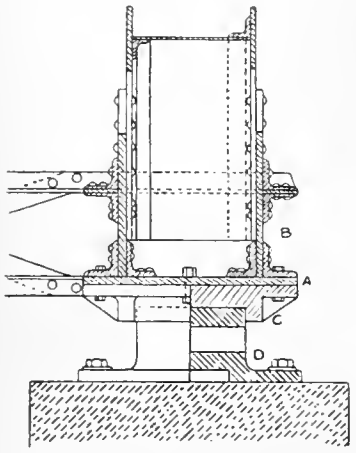

Fig. 245.

is similar, but the lower one D rests upon the live rollers E, which in turn rest upon the casting F, bolted to the pier. The rollers are merely placed between the top and bottom castings, being

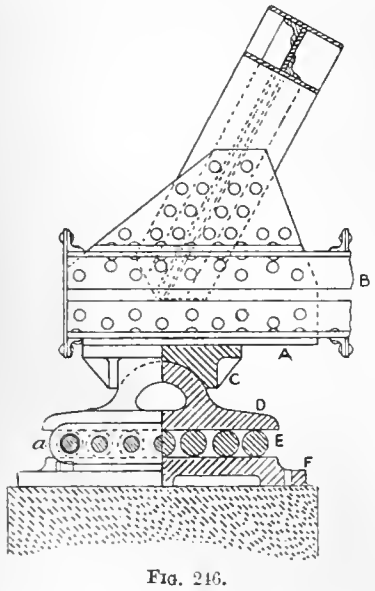

Fig. 246.

retained equidistantly by means of end cradles, *a a*. The semicircular fitting of the castings C and D prevents the varying deflections of the bridge from putting strain on the bearings.

As a rule, mild steel is used for rollers and rockers, cast steel for their bearing castings, and cast iron for the base, which is fastened to the masonry with bolts. To insure a good joint between the latter, sheet lead is sometimes interposed, 6lb. lead being a suitable thickness.

Much care has to be exercised in the fitting. The rollers are always turned, and sometimes ground in addition. The surfaces on which they move are planed, and the top bearing is planed to fit the bottom boom.

Figs. 248—251 illustrate the bearings of

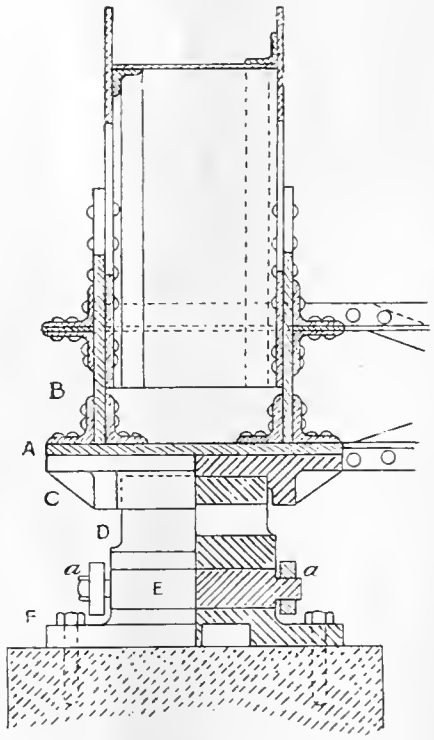

Fig. 247.

viaducts on the Manchester Ship Canal, the viaducts being built of lattice girders, each 156ft. long. Fig. 248 gives one view of the fixed bearings, and Figs. 249—251 views of the movable ones. The span being short, rockers are used instead of rollers for the latter. In Fig. 248 the top and bottom saddles A and B are of cast steel, and the pin C is of mild steel. The top saddle is attached with turned bolts to the bottom boom. In the rocker bearings, Figs. 249—251, cast, and mild steel are used similarly. The rockers are turned on their bearing faces. They are inclosed in a built-up frame, and retained in place by set-screws, the rollers and frame being seen detached in Fig. 251. There are side-guards on top and bottom saddles;—Figs. 249 and 250, to act as

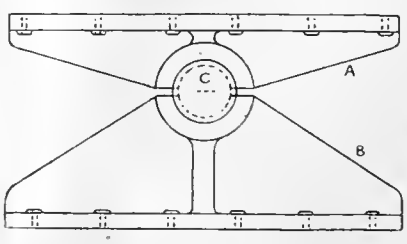

Fig. 248.

checks on the rollers sideways. The steel castings are strongly ribbed, Fig. 249; and those in Fig. 248 are ribbed similarly, in order to afford ample strength to resist crushing stresses. Figs. 252 and 253 show roller bearings which differ slightly from the preceding. The frame is united with bolts passing through distance-pieces, and the rollers are turned down in the centre. They are but light, being 3in. diam., for a single-line light railway bridge.

Probably no structure has ever been erected in which the effects of temperature had to be taken account of under such difficult conditions as the Forth Bridge. It was necessary to await a definite rise in temperature, in order to make some of the permanent connections. An allowance of no less than two feet was considered

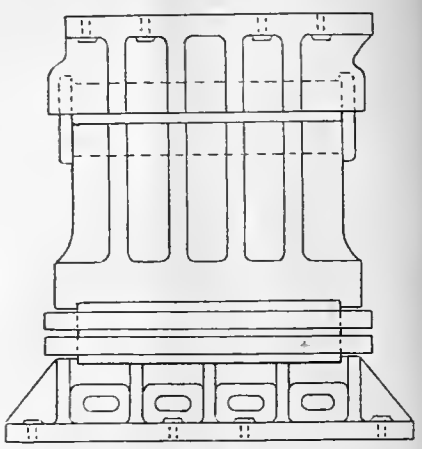

Fig. 249.

requisite to make between the cantilevers and central girders, and the nature of the connection between these rendered expansion rollers impracticable. These, in fact, were only employed in one portion of the bridge—namely, in the cantilever end piers. At the ends of these fixed cantilevers a movement of one foot is provided for. Elsewhere, the methods adopted were of an original character. In this bridge, too, the movements are of so complicated a nature that it

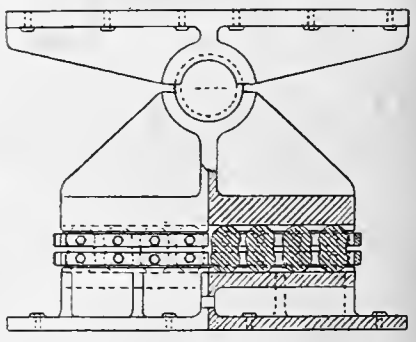

Fig. 250.

was necessary to make provision for them in more than one direction. Thus, the effect of the sun shining on one side of the bridge, and of a cold wind blowing on the other, would be to warp or curve it, and the same effect would follow from a strong wind blowing on one side of the bridge. Since the connection between the cantilever girders and the central girder cannot be rigid, it was necessary to contrive a pivoted joint for horizontal swing,

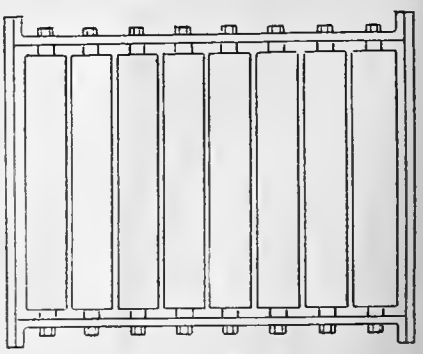

Fig. 251.

with the joint for longitudinal movement. The distance between Inchgarvie and Queensferry is 1,970ft., and between Inchgarvie and Fife 1,710ft. The maximum provision made between each of these is 24in., and is located at each end of the Inchgarvie cantilever. The distance was settled by experiment only, after many careful measurements taken at different times, and at

various temperatures; and this determined the length of the middle girders, so that there should be sufficient play between them and the cantilevers under the greatest heat of summer, with

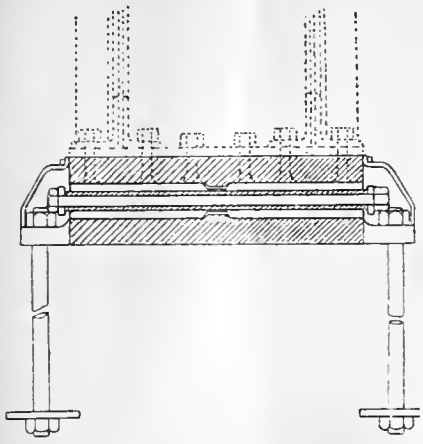

Fig. 252.

full sunshine. At the mean temperature, which is 51° Fahr., the bottom booms of the central girders stand about 1ft. away from the ends of the cantilevers.

The expansion connection is effected by means of rocking-posts (Fig. 254) and slide blocks (Fig.

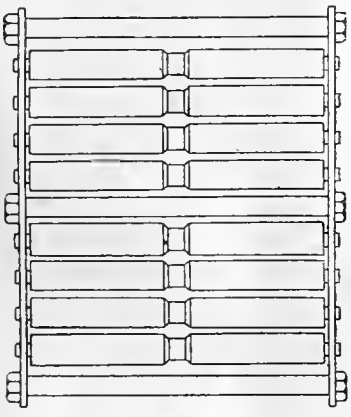

Fig. 253.

255), and expansion joints in the rails. The rocking-post (Fig. 254) forms a connection by ball and-socket joints, with the top boom B of the central girder, and bottom boom C of the cantilever, the top boom of the former projecting

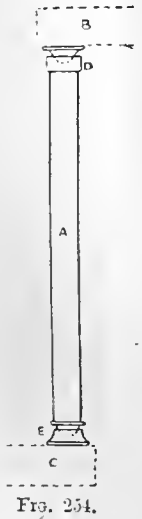

Fig. 254.

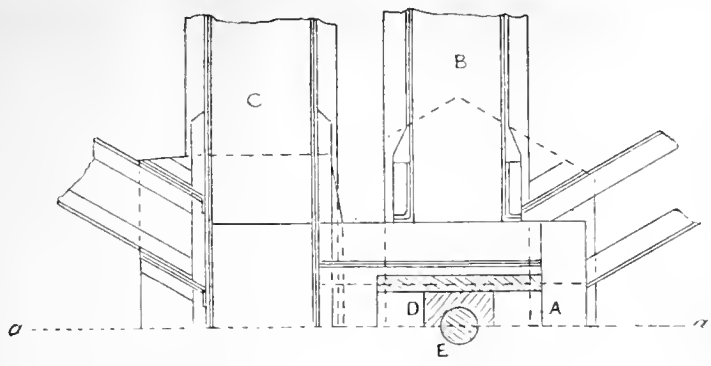
into the cantilever. At the normal temperature these posts are vertical, but move out of the perpendicular with thermometric changes. The ball-and-socket joints D, E, of 12in. radius, were selected by reason of their large bearing surface,



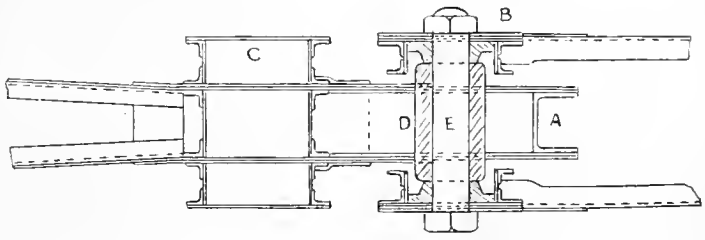


Fig. 255.

far in excess of that of suspending links. The posts A are built of steel plates and angles, and the balls and sockets are steel castings. The weight is thus transmitted from the top booms and rocking-posts to the bottom booms of the cantilevers, and side horizontal movement can

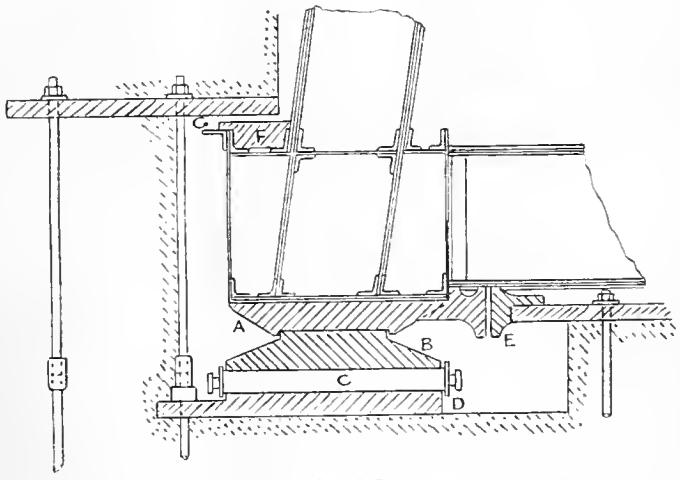

Fig. 257.

also take place. To maintain the booms in alignment, while yet allowing freedom to move lengthwise, and to pivot, a tongue or bracket A is carried (Fig. 255) from the cantilever C to the central girder B in the longitudinal centre of the bridge. The upper part of Fig. 255 illustrates this connection in half-plan view, *a a* being the longitudinal centre, and the lower half is a section taken perpendicularly to the former view. The tongue A passes from the last cross-girder of the cantilever into that of the girder, a similar construction occurring both

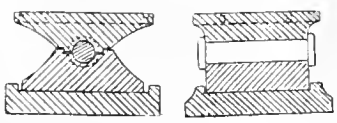

Fig. 256.

in top and bottom. It has a slotted hole with faced sides, in which slides a block, D, 15in. square, secured by a 9in. bolt, E, to the first cross-girder of the centre girder. A long expansion-rail joint over each junction of girder with cantilever is also made, being devised in such a way that the gauge is always preserved constant. Fig. 256 shows the pivot of the fixed end uniting girder and cantilever.

In the cantilever end piers longitudinal movement is provided for, as previously mentioned by rollers, and also side and vertical movements, Fig. 257. Here steel castings, A, are bolted to the bottom ends of the cantilever. These rest on the head of the roller bearing castings B, which are of the ordinary type, the rollers C moving in a frame between top and bottom plates B and D. To limit movement sideways, a projection with a flat face on the side of the cantilever castings, A, will come into contact with a projection on a plate, E, bolted to the masonry. To prevent possible rising of the cantilever due to gusts of wind, which might overstrain the metal, steel castings, F, are attached to them, to come into contact with overhanging castings, G, built into the masonry.

These examples cover most of the ground; but with differences in design different problems have to be solved. The Tower Bridge has a complicated system of roller bearings to carry the chains over the main columns, the Niagara Suspension Bridge has an automatic arrangement of lever and wedge to compensate for 8½in. of expansion. With increase in dimensions and complexity of form, the problems of compensating for the expansion of iron and steel structures demand more original solutions. Once on the Forth Bridge, a sudden fall in temperature taking place during the making of a permanent connection, about thirty rivets were shorn off, with a report like a 38-ton gun. Sometimes artificial heat had to be applied to girders to permit of riveting up parts. J. H.

The proposed Thames-side line from Marlow to Henley-on-Thames, promoted by the Great Western Railway Company, will not be proceeded with.

COPYING PROCESSES FOR REPRODUCING AND DUPLICATING DRAWINGS, PLANS, &c.

THE old familiar process of copying a plan by tracing it on tracing-paper is hardly consistent with the present go-ahead times. By means of chemical and photographic processes a much more rapid means of reproducing a plan is ready to hand. If the plan be one that is washed-in with various water-colours, a photographic method of reproduction is the only one to use. If the plan be one that is drawn in ink which contains a salt of iron and copper (such as most writing-inks do), then the blue or brown process of reproduction may be followed. Both these processes depend for the result on the chemical reaction that takes place between the iron or copper salt in the ink and the ferrocyanide of potassium with which the paper has been treated which is to take the copy.

Other methods of copying, such as the cyclostyle, hectograph, &c., are suitable for many cases that crop up in an architect's office. The following description will put the reader in possession of all necessary details for carrying out any of the copying processes in vogue.

PHOTO-CHEMICAL PROCESSES.

The following processes depend for their success on certain chemical reactions which occur in the treated paper when subjected to the influence of light:—

No. 1.—Prepare two compounds (*a* and *b*) as follows:—Compound (*a*): 15 parts of curd soap, 15 parts of alum, 20 parts of glue, 5 parts of albumen (white of egg), 5 parts of spirits of wine 60° strength, 250 parts of water, 1 part of glacial acetic acid. Preparation: Cut up the curd soap (this is a white hard soap made from tallow and soda salts), and dissolve it by gently heating in about twice its weight of water, separately soak the glue in its own weight of water until it is soft (about 12 hours), and then gently heat it and mix it with the soap solution; stir well until the mixture froths and is homogeneous. Mix the acetic acid with the spirit and the albumen in the remainder of the water, dissolve the alum; finally mix all together. Compound (*b*): 25 parts of burnt umber ground up in spirits of wine, 10 parts of lampblack, 5 parts of glue, 5 parts of bichromate of potash, 250 parts of water. To prepare the paper that is to take copies of drawings, first dip it in compound (*a*), and then, after drying, in compound (*b*), when it will be sensitive to light, and should be preserved in the dark. This paper will be the negative paper. For preparing the positive paper, treat it in the above manner without the aid of burnt umber, and only lampblack or any other suitable coloured pigment which will not be reacted on by the chemicals used. To take a copy, put the drawing of which a copy is to be obtained, in a photographic printing-frame, and lay a sheet of the negative paper over it, and expose the frame to the sun's rays for about two minutes (in cloudy weather a longer exposure is necessary). After exposing the negative paper, put in water to develop it, when a facsimile of the drawing will appear on it in white lines on a black ground, or as a negative or reverse picture. Dry the negative paper thus printed and place it in the glass of a printing-frame, and then lay a sheet of the positive paper on it close up to the frame, and expose to light as before, when the positive paper will be printed on, and the drawing will be developed by placing the positive sheet of paper in water, whence the black colouring matter is dissolved off, and the drawing appears.

No. 2.—To reproduce drawings made in black and white:—The reproductions may be made on paper or on linen by twice coating material with the following compound:—5fl.oz. of water, 135gr. of chloride of iron, 70gr. of citric acid, 217gr. of gum arabic. Place the material coated with the compound under the drawing to be copied, with the prepared surface to the drawing, and expose to strong sunlight for five or fifteen minutes, according to the thickness of the paper on which the drawing is made; then dip the copy in a solution of yellow prussiate of potash or of nitrate of silver to be developed, and then wash it in a solution bath of water which has been slightly acidified with sulphuric or hydrochloric acid.

No. 3.—To produce copies in black lines on white ground. Sensitising bath prepare as follows:—In 47oz. of distilled water dissolve 1oz. of tartaric acid, 5oz. of sulphate iron purified crystals, 10oz. of perchloride of iron (45° Be.), 3oz. of common salt (sodic chloride), 25oz. of gum. For the developing bath use a solution of red or yellow prussiate of potash (i.e., ferricyanide or ferrocyanide of potassium). It does not matter whether this solution be alkaline, acid, or neutral. After removal from this bath, wash the paper in water to free it from excess of prussiate, and then dip in a solution of acetic, hydrochloric, or sulphuric acid. To take copies of the drawings, sensitise sheets of paper by dipping them in the sensitising bath and then drying them in the dark. Then put this sensitised paper in the photographic printing frame, and lay over it the drawing which it is desired to copy, and expose the frame to sun or strong light. Then remove the sensitised paper, and dip it in the prussiate solution to develop the printing, and afterwards pass it through water, and finally dip it in the acidified water, and dry. The parts of the sensitised paper which did not receive the light will take a dark-green colour; but the other parts do not change. After washing, however, the lines which have been printed on the sensitised paper will be of a deep indigo or black colour.

No. 4.—To change blue printing on a white ground to black proceed as follows: Make a solution of potash by dissolving 1oz. of common potash in 25oz. of water, and dip the blue-printed proof in this solution, when the blue figures will assume a rusty-brown colour by conversion into iron oxide; then dip this proof in a solution composed of 1oz. of tannic acid and 20oz. of water. The brownish oxide of iron will be changed to a black colour by the tannic acid, and this is fixed by washing the print in pure water.

No. 5.—Sensitise paper as follows: Make a solution of bichromate of potash, and dissolve in it some gum or white of egg; and then mix in the solution some lampblack or other inert pigment, such as water, and brush this over the sheets of well-sized paper as evenly as possible, doing this in a dark room or by lamplight, and dry the paper in the dark. On a sheet of thin sensitised paper lay the drawing (which, if not done on transparent paper or tracing-paper should be oiled and dried so as to render it translucent), and expose the drawing to the light in a photographic printing-frame. Remove the drawing from the sensitised paper, either in a dark room or else by lamplight, and wash the sensitised paper with water, when a negative of the drawing remains, as the portions of the coating which have been acted on by light are insoluble in the water. By preparing a negative like this a large number of positives may be taken.

No. 6.—To take copies of drawings, plans, &c., that have been done in printing-ink: Wet a piece of stout paper in water and lay it on the printed matter it is desired to copy, and then rub the back of this paper with an agate burnisher or ivory handle of a knife, when a negative of whatever is done in the printer's ink will be obtained. If the ink does not readily yield a copy, moisten it with spirits of wine, or spirits of wine in which a little essential oil of lavender has been mixed. Lay a piece of blotting-paper beneath the printed one.

No. 7.—Sensitise the paper to be used for copying in the following solution:—1½ pint of distilled water, 1oz. of sulphate of iron, 1oz. of sesquichloride of iron, 1oz. of gelatine, 1oz. of tartaric acid. After sensitising the paper, keep it in a dark receptacle, not rolled. For use, lay the drawing which is to be copied—the paper on which same is drawn should be transparent—on the sheet of sensitised paper, and then expose same to light, when the parts of the sensitised paper which are influenced by the light will lose their greenish-yellow colour. For a developing solution, mix 1fl.oz. of alcohol, 9½oz. of gallic acid, 50fl.oz. of water, and dip the exposed drawing in the fluid, when the greenish-yellow lines turn black at once. Rinse in clean water, and dry.

CYANOTYPE COPYING PROCESSES.

Blue-print process: Sensitise the paper with the following solution:—10fl.oz. of distilled water, 1oz. of soluble citrate of iron (or else double citrate of iron and ammonia), 1oz. of red prussiate of potash. Mix these ingredients when required for use, and brush it over the surface of the paper to be sensitised as uniformly as possible. The sensitised paper should be kept in the dark out of the reach of light until it is required for use, the process of which is as follows. Cover a drawing-board with two or three thicknesses of blanket, and upon this place the sensitised paper, with the sensitised side uppermost: then lay the drawing to be copied, which should be on tracing or other transparent paper, on the sensitised sheet of paper. Lay a piece of glass over the drawing, and press it firmly and evenly down, so as to make every part of the drawing and sensitised paper be and remain in contact. These operations should be carried out in a dark-room; then expose the whole to clear sunlight from 4 to 6 minutes in summer, 6 to 10 in winter, and, in the absence of sunlight, for 30 minutes under a clear sky. Then remove the drawing from the sensitised paper, and pour water over the latter from one to two minutes, so as to thoroughly saturate it, and then hang it up to dry, when the yellowish-bronze colour will become darker, and the lines of the drawing still darker; the sensitised surface becomes of a blue tint, with the lines of the drawing in vivid contrast. Instead of the above sensitising solution, the following mixtures can be kept ready prepared, and mixed when wanted for use:—Solution (*a*): Dissolve 1oz. of citrate of iron and ammonia in 4oz. of distilled water; keep this in a stoppered bottle. Solution (*b*): Dissolve 1oz. of potassic ferrocyanide (red prussiate) in 4oz. of distilled water, and keep in stoppered bottles. When wanted for use in sensitising the copying paper, mix equal quantities of (*a*) and (*b*), and either float a sheet of paper in a bath of the mixture, or else brush or sponge it over evenly. Blue prints obtained by the above process may be changed to brown or green by the following method. To connect blue prints with green ones, make the following solutions. Solution (*a*): A crystal of nitrate of silver as large as a pea, 8oz. of distilled water. Solution (*b*): 1fl.oz. hydrochloric acid, 8fl.oz. water. Solution (*c*): Potassic iodide solution (1oz. potassic iodide, 8oz. of water) saturated solution of bichloride of mercury water. To prepare this solution add as much of the potassic iodide solution to the bichloride of mercury one until the red precipitate is just redissolved, then reduce the resulting solution with four times its bulk of water. Solution (*d*): 1dr. of iodide of potassium, 16oz. of water. Method of usage: Dip the blue print in a bath of solution so as to bleach it until the blue lines turn either a pale yellow or else slate colour; then wash the print thoroughly in water and dip it in solution (*b*). This will restore the blue printing. Next, without washing, put the print into solution (*c*), when the printed lines will be of a green colour; but the "whites" of a yellow colour. Then put the print in (*b*) again, without washing. Next pour solution (*d*) over the print to purify the white, and give the green image a bluer tint. Do not let the print remain in this solution too long, or it will become blue again.

H. C. S.

(*To be continued.*)

CHIPS.

The War Department estimates contain a vote of £66,000 for barracks and other buildings at Pendennis, near Falmouth.

The foundation-stone of a new Wesleyan chapel was laid in the High-street, Ramsey, Hunts, last week. The building will be Gothic in style, and the contract for erection has been taken by Mr. Wade, of St. Neot's, at £1,920.

A new block of buildings is about to be erected at Llandrindod Wells for the London and Provincial Bank, Limited. The directors have instructed Messrs. Wilson and Moxham, architects, Swansea, to prepare the designs.

The North-Eastern Railway Company are about to widen the Leeds and Wetherby Railway, eleven miles in extent, and to construct a short junction line at Wetherby about half a mile in length. This will involve about 200,000 cubic yards of earthwork and the building of no fewer than 30 bridges. Tenders are now being invited.

An Order in Council has been made for the sale of Addington Park, on the ground that it is "expensive to maintain and otherwise undesirable to maintain as an Archiepiscopal residence." With the proceeds it is proposed to provide a house for the Archbishop within or near the city of Canterbury.

The Whitechapel Picture Exhibition, to be opened on Tuesday next, is expected to be very attractive this year. Among the many works by the late Sir John Millais, which are to be transferred from Burlington House to St. Jude's Schools are "Chill October," "The Old Garden," "Lilacs," "A Message from the Sea," and "Lord Salisbury," and we are informed that the Queen has lent the portrait of the child Princess Marie of Edinburgh, now Crown Princess of Roumania. The exhibition closes on April 17.

Our Illustrations.

WOLVERHAMPTON LIBRARY COMPETITION: SELECTED DESIGN.

The two accompanying double-page plates in illustration of the first premiated design in this competition were reproduced from the original drawings by Mr. Henry T. Hare, A.R.I.B.A., the author of this plan, chosen by Mr. Alfred Waterhouse, R.A., the referee. It is proposed to face the building with red-brick and buff terracotta dressings. The floors are to be fireproof. The news-room and magazine-room are intended to be warmed on the "plenum" system, and the other rooms and entrance-hall by radiators. The curved outline of the site and its special surroundings offered no little difficulty in designing a satisfactory building, and the exceptionally large areas stipulated for in the conditions were at variance with the money restrictions imposed upon the competitors. The competition was a limited one, and the nine architects who submitted designs appear as follows in the official report:—Mr. H. T. Hare, A.R.I.B.A.; Mr. J. M. Brydon, F.R.I.B.A.; Mr. Maurice B. Adams, F.R.I.B.A.; Mr. W. H. Bidlake, Birmingham; Mr. W. Henman, Birmingham; Mr. W. Martin, Birmingham; Mr. F. W. Simon, Edinburgh; Mr. F. T. Beck, Wolverhampton; and Mr. G. H. Stanger, Wolverhampton.

FARM BUILDINGS AT COPPED HALL, EPPING, ESSEX.

These buildings, the property of Mr. Ernest J. Wythes, J.P., recently inclosed for the home farm at Copped Hall, occupy a central position for the working of the farm on high ground, conveniently placed for roads and water, and within a few hundred yards of the mansion. The home farm consists of some 600 acres of heavy clay land (mostly grass), and the new buildings, which have been planned for dairying and breeding purposes, cover an area of 25,000sq.ft., and are capable of housing 120 to 150 head of cattle, the accommodation consisting of 56 standings for tied cattle, 19 boxes for in-calvers, calves, and bulls, and covered yards to hold about 35 head of cattle. There are also two mixing floors (with chaff floors over), two granaries, with space for about 400 quarters of corn, various storehouses, cart and implement sheds, nag-horse stables (two stalls and one box), and coachhouse and piggeries. Detached from the main building, and at a convenient distance from the cowhouses, there is the separator house, also men's mess-room, fowl-houses, sick-box, more piggeries, boiling-house, meal-store and slaughter-house, the whole being substantially built of red brick, roofed with Staffordshire tiles, with the exception of the covered yards, where the open-boarded system has been adopted, the boards being creasoted, grooved, and placed ¾in. apart. The plans and views will show the arrangement and style of the buildings. Entering from the stackyard on the north side through a wide archway under the granary, are the mixing floors on either side, with chaff-shoot and steps to floors above and sliding doors leading to the feeding gangways, which run down the centre of the long ranges of cowhouses, the gangway at the upper end continuing round to the piggeries and range of boxes on the south side of the building. It will be noticed that the position of the mixing floors is convenient for the stack-yards and granary, as well as for feeding, and it may be pointed out that the open space in the centre of the buildings makes the covered yards particularly "light and airy without being draughty"—this is, of course, a matter of great importance to owners of cattle. In the making of covered yards this is overlooked, and that is why they are so often carried out unsatisfactorily. The floors of all the cowhouses, boxes, and gangways are laid with granite concrete and grooved, and the whole of the drainage is conducted into a liquid-manure tank under the cartshed at the lower end of the buildings, from whence a chain-pump delivers it into carts for distribution on the land. The drainage was made easy by the natural fall of the ground, which amounts in the length of the building to upwards of 12ft. The floors of the various cowhouses, boxes, &c., are placed in different levels to suit the fall of ground, and steps in the buildings are happily avoided altogether by sloping the gangways, &c. The upper cowhouses have iron fittings filled in with oak, carrying a shell-shaped drinking-trough for each beast, the water supply being by gravitation from large pond near. The mangers to these houses are of stoneware, the fronts being faced with brown and white glazed bricks, with oak capping; other mangers and troughs throughout the buildings are of concrete. Loading and unloading corn, &c., is made easy by double-lift hand-hoists, and the hoists being in the centre of the floors under the archways, the work can be carried on in all weathers. It should be mentioned that the cart-horses are kept in a separate set of buildings elsewhere on the farm, where also the cutting of chaff, grinding, &c., is carried out by steam power, the latter being used also for electric-lighting purposes. The agent is Mr. P. W. Dashwood, and the clerk of works is Mr. Geo. W. Johnson, who acted as architect. The farm steward is Mr. J. B. Ormond.

NATIONAL PRIZE DESIGN FOR STAINED GLASS WINDOWS.

The subjects of "Lancelot" and "Guinevere" are chosen for this work now being executed. The intention in "Sir Lancelot" is to express remorse for his love of Guinevere. In the background, the Vision of the Holy Grail appears. In "Queen Guinevere" it is endeavoured to express the extreme contrast, by her regal and gay attire, with the solemn character of the monastic surroundings which are suggestive of her future. These cartoons were awarded a National Book Prize last year to their author, Mr. Henry Ospovat, of Kensington.

THE ROYAL FREE HOSPITAL.

The Royal Free Hospital, Gray's Inn-road, W.C., is an institution in every respect free, and it is situated just where a hospital of the kind is most needed. The locality is one of the poorest and most densely populated in the Metropolis, containing 61 per cent. of the poorest classes, and 297 persons to the acre. Since its foundation in 1828, the Royal Free Hospital has relieved the destitute sick to the number of 2,221,880. Of course, the hospital soon required more room, and in the year 1842 it was removed from Greville-street to the site it still occupies in the Gray's Inn-road. Having no endowment, the governors were forced to be content with some old barracks in the former occupation of the Light Horse Volunteers. A welcome addition was made, however, by the Freemasons of England on the death of the Duke of Sussex, their late Grand Master. They erected the "Sussex" wing to his memory, placing a statue of his Royal Highness in front. This wing was opened in 1856, and six years later the freehold of the hospital was purchased, chiefly through the zeal and ability of the then chairman of the hospital committee—the late well-known philanthropist, George Moore. Fifty beds were subsequently added, when another wing, the "Victoria," was built in 1876, out of a large sum bequeathed by the late Rev. John Gautier Milne. In addition, a large out-patient department (including waiting-rooms for men and women, a dispensary, and a covered way communicating with the rest of the building) was also erected. Owing to the receipt of considerable legacies, further accommodation was provided next year—the nurses' quarters, isolated wards for patients, a large lecture-room, private rooms for the medical staff and the students, a museum, *post-mortem* theatre, mortuary, and a number of store-rooms and other essential adjuncts to the hospital. By this the bed accommodation was brought up to 160, and the hospital equipped throughout on the very best lines for the comfort of patients and nurses alike. So far, we have spoken mainly of the new wings. All that remains of the old barracks are the casualty rooms, dispensary, drug-stores, laboratory, the resident medical officers' quarters, and the steward's, housekeeper's, and servants' rooms. The committee decided three or four years ago to rebuild the whole of the front at a cost of £20,000, by Mr. W. Harvey, F.R.I.B.A., the architect of the hospital, and this has now been completed, as seen in the accompanying view, lent us by the architect. The centre quadrangle has some well-grown trees in it, and on a pleasant summer day convalescent patients may be seen taking a welcome airing on the seats in the shade. As for the wards, they are more than usually large and airy, while the quantity of flowers displayed on the tables in the centre give them a most home-like and charming appearance, soothing, indeed, to weary patients longing to be at liberty. There are also plenty of pictures and ornaments, all of which contribute to the same end. The nursing staff is large and capable. This leads us to refer to one extremely important point in connection with the management of the Royal Free Hospital—its association with the London School of Medicine for Women. We believe this is the only hospital in England whose doors are open to lady students. Here these ladies are enabled to obtain actual clinical experience of the greatest value; and the outcome has been the placing of many of them upon the Medical Register; others have taken the very highest honours at the London University. Over 2,000 poor sick persons are annually treated, not to speak of the advice and medicine administered to nearly 25,000 out-patients—all gratuitously—at an annual cost of about £11,500 per annum, of which only some £2,500 is assured.

CHARTERHOUSE SQUARE.

We give herewith the general plan, &c., which we promised on page 301, when we fully described and partly illustrated Mr. Walter H. Bourne's careful and useful drawing of this famous old foundation.

CHIPS.

A Local Government Board inquiry will be held at the Council House, Bristol, to-day (Friday), in reference to an application by the corporation of that city to borrow £43,000 for the extensions decided upon at the Stapleton Lunatic Asylum.

At a vestry meeting held at Bury St. Edmund's last week, it was reported that the roof of St. Peter's district church was very insecure, and needed restoring, while the organ is beyond repair. It was decided to raise funds for a restoration fund.

Mr. Lionel Cust, director of the National Portrait Gallery, will to-morrow (Saturday) afternoon, at 3 p.m., deliver the first two lectures at the Royal Institution on "Portraits as Historical Documents; Portraits as Monuments."

The contract for the construction of the extension of the City and South London Railway from Stockwell to Clapham Common is said to have been placed. This extension, which is to be completed in fifteen months, with the opening of the company's line to Moorgate-street, now being rapidly pushed on, will, it is confidently expected, open a new era of prosperity for the company.

In the Chancery Division on Tuesday, Mr. Justice Stirling gave judgment in an action, "Ailhusen v. the Ealing and South Harrow Railway Company," in which the plaintiff, the owner of a mansion-house known as Twyford Abbey, sought to compel the defendants—who had given notice to treat for the purchase of a small portion of a private road forming the approach to the house for the purposes of their railway—to purchase the whole of the property. His Lordship refused the plaintiff's motion for an injunction, holding that the land which the defendants sought to acquire would not pass under conveyance as part of the plaintiff's house.

BOOKS RECEIVED.

Norwich Cathedral is succinctly described and excellently illustrated in the handy volume just published as one of Bell's Cathedral Series of monographs on the English minsters (London: Geo. Bell and Sons). The book on Norwich is written by Mr. C. H. B. Quennell, and contains forty illustrations from drawings by Mr. S. K. Greenslade, and photographs, and also a clearly engraved plan. A history of the fabric is given, it being shown that the cathedral occupies the site of no earlier church, and that to-day, in plan and general bulk of detail, it is as characteristically Norman as when left finished by Eborard, the second bishop. Its distinctive features, the long nave, the grand apsidal termination encircled by a processional path, the segmental chapels to north and south of the apse, the centrally-placed bishop's chair and westward position of the throne are dwelt upon. The Close gates are described and pictured, and supplemental chapters deal with the sees of the East-Anglian bishops and the city itself. Everyone interested in our church architecture—and what educated man or woman is not?—ought to possess this cheap and well got-up series of handbooks.——*The Cathedral Church of Peterborough*, by the Rev. W. D. Sweeting, M.A. (London: George Bell and Sons), is another of the excellent handbooks published in Bell's Cathedral Series, of which we have noticed many. It is only necessary to add to our former notices that this handbook is compiled from the best and latest sources, such as Gunton's "History of Peterborough," Craddock's "History," the monographs of Professor Paley, Mr. Poole, and Canon Davys. The work is divided into six chapters, which deal with the history of the cathedral church of St. Peter, the exterior, the interior, the Minster precincts and City, History of the Monastery and of the Diocese. There are nearly 50 illustrations, many of these being clear reproductions of photographs by the Photochrom Company, Ltd., and Messrs. S. B. Bolas and Co. Other illustrations are from sketches by Messrs. H. P. Clifford, W. H. Lord, and A. R. Allbrow. The views of the apse and new buildings, the triple-gabled west front, and the interior are excellent. Reference is made to Mr. Pearson's restoration of the north gable, and to the controversy which raged so furiously some time ago. To all students and visitors this handbook will be a valuable guide.——*Spons' Architects' and Builders' Price-Book*, 1898, edited by W. Young, architect (London: E. and F. N. Spon, Ltd., Strand), retains its useful alphabetical arrangement, and has been carefully revised and brought up to date by the insertion of a chapter on electricity, with a complete specification and estimates of electric-lighting installations; also notes on lightning conductors, electric bells, and memoranda on concrete fireproof floors, &c. The notes and memoranda on ancient lights, architects' charges, floors, girders, measurements of work, stones, approximate cost of buildings, besides those of each trade, make this book, as we have said before, a textbook of general use, as well as a price-book.——We have received a third edition of *Willis's Workmen's Compensation Act*, 1897 (London: Butterworth and Sons, 7, Fleet-street). This reliable handbook, by Mr. W. Addington Willis, LL.B., is supplied with copious notes, and has an appendix giving the Employers' Liability Act of 1880. A new feature in the edition is an analysis of a proposed scheme to be certified under the Act of last session, and a form of application for a certificate.——The last quarterly issue of the *Essex Review* (Chelmsford: E. Durrant and Co.), contains illustrated articles on "The Hawys of Saffron Walden," by Algernon R. Goddard, and on "Essex Brasses," by Millar Christy and W. W. Porteous.

A group of labourers' dwellings at Liverpool, which have been erected for the accommodation of those who have been dispossessed of houses by the action of the Insanitary Property Committee of that city, are now ready for occupation, the rents ranging from 2s. 6d. to 3s. 6d. a week, the corporation paying rates and taxes.

The building trade throughout North Staffordshire is in a flourishing condition, and there is every prospect of a continuance of the same, cottage property for artisans being in great request. At Burslem bricklayers report a small percentage out of work, but joiners are well employed. In Hanley all branches are busy, with none out of employment. A similar remark applies to all the other pottery towns.

PROFESSIONAL AND TRADE SOCIETIES.

York Architectural Society.—At the meeting on Friday evening of this body, Mr. C. H. Channon, of Malton, delivered a lecture on "Old Malton Priory," illustrated by measured drawings, and showed a conjectural restoration, developed from actual data, describing what the building would be like in its original and pristine grandeur. The church, he said, is interesting as being the only one of the Gilbertine Order remaining in which public worship is still held. It was founded in 1150 by Eustace FitzJohn. The Gilbertines sheltered Thomas à Becket during his flight from the King's wrath. Of the twenty-six Gilbertine monasteries suppressed by Henry VIII., twelve were in Lincolnshire, the home of the Order, five in Yorkshire, three in Cambridgeshire, and the rest distributed singly in the Midland counties. Everyone of these, with the exception of that at Malton, has entirely disappeared, and thus this little Yorkshire town possesses a church unique in character, and valuable as a national monument. Mr. George Benson occupied the chair. At the close of the lecture, Mr. A. Pollard proposed, and Mr. A. B. Burleigh seconded, a vote of thanks to Mr. Channon.

The widening of Cherry-street at a cost of £12,300 has been agreed to by the city council of Birmingham.

A new organ for the Presbyterian Church, Bristol, has just been completed by Messrs. Hele and Co., of Exeter and Plymouth. Special services in connection with the opening of the organ have just been held.

A new church of St. Silas, which has for some time been in course of erection on a commanding site in Preston New-road, Blackburn, will be ready for opening after Easter.

The Lower Mosley-street Schools, Manchester, built in 1836, are about to be demolished, the site being required for the new Great Midland Hotel. A new and larger building has been erected on the other side of Lower Mosley-street at a cost of £5,700, and is on the point of completion.

The tomb of the Duke of Clarence and Avondale, in the Albert Chapel at Windsor Castle, is now being completed. A recumbent statue of the Duke is to be placed upon the lid of the Mexican onyx sarcophagus containing the coffin, and the Royal burial place will be surrounded by bronze railings.

Professor Charles Eliot Norton will retire from the Department of Fine Arts in Harvard University at the end of the present academic year. Professor Norton has had, for the last thirty years, a very great influence upon American artistic ideas. His courses of lectures at Harvard University have been extremely popular, attracting usually more than four hundred registered attendants.

The urban district council of Sheerness have applied to the Local Government Board to sanction a loan of £13,700 for the construction of a new iron pier in place of the wooden structure which was built in 1833 and partially destroyed in the gale of Nov. 29.

At Edmonton County-court, on Friday, an action was brought by a bricklayer, named Gardner, of Westmacott-street, Camberwell, against Knight and Son, builders, Tottenham, to recover damages under the Employers' Liability Act, for injuries sustained through negligence of defendants' servant whilst the plaintiff was employed by them in carrying out internal alterations at the Crown and Shears public-house, Sparrow-court, Minories, E.C. A verdict was returned for plaintiff for £50 and costs.

The Bill for the construction of the City and Brixton Electric Railway, which the City and South London Company have agreed to work in perpetuity, came, on Friday, before a special committee of the House of Commons. It was practically unopposed, and was passed by the committee subject to the insertion of clauses to be arranged with the St. Saviour's District Board of Works. The proposal is to provide stations at Brixton Hill, Lorne-road, Kennington Oval, Kennington Cross, St. George's-circus, and King William-street; and the City and South London Company will have connections at the Oval and at the Borough. Sir Benjamin Baker is the engineer.

A new hospital is about to be built by Lord Forester near the railway-station at Wenlock, on a site of four acres. Mr. A. Balfour is the architect.

A meeting of the Conway and Colwyn Bay Water Board was held on Friday to consider the claim of the engineer, Mr. T. B. Farrington, C.E., for £2,000 for services rendered. The board offered £1,600, which was declined, and the matter remains in abeyance for a month.

COMPETITIONS.

Altrincham, Cheshire, Public Offices.—In competition for this building, to cost £4,000, 26 architects sent in designs. The council requested Mr. John Ely, F.R.I.B.A., president of the Manchester Society of Architects, to act as assessor, and this award was before their meeting on the 18th inst., when it was found that the first place was given to the design "Vox Populi," by Messrs. Chas. A. Hindle, A.R.I.B.A., and H. Davenport, of Monton, near Manchester. The second place is taken by "Altrincham," by Mr. J. Macnamara, of Altrincham. Before opening the assessor's award, the council passed a resolution deciding to adopt the design placed first. This is an excellent procedure, and would give confidence to competitors if more generally adopted. The designs are to be exhibited in public.

CHIPS.

A Free Church and lecture-hall are about to be built in St. John's-road, Tunbridge Wells, from plans by Mr. Galey, of that town.

A destructive fire occurred on Friday night in an extensive house carpentry yard in Ayr, and the whole premises and stock of timber were burnt out. The loss is estimated at £5,000.

In aid of the effort which is being made to fill with statues the niches which adorn the beautiful west front of Beverley Minster, Professor Woodberry, of New York University, has forwarded a cheque for £35, the cost of two statues, as a contribution from the Historical Society of Beverly, Massachusetts, of which the professor is the president.

The official view with regard to the desire of the Museums Committee that they should be consulted in connection with the changes at South Kensington is that the demand is inadmissible, as the plans must be left to be settled by experts. It is probable that it will be some time before they are framed, and the building operations may extend over two or three years.

The London School Board discussed at their last meeting a proposal of the School Management Committee to set apart £100,000 in the coming year for the purpose of improving old schools. An amendment was proposed to refer the matter to the Works and Finance Committees to bring up the whole scheme, with an estimate of the total cost; but after discussion this was rejected, and the original motion was adopted.

Mr. E. Druce, who superintended the building of the Admiralty Pier at Dover on behalf of the Government and was in charge of the structure until it was handed over to the Dover Harbour Board several years ago, died suddenly on Tuesday at his residence in Victoria Park, Dover.

The fine organ of St. James's Church, Piccadilly, originally built by Renatus Harris for the Chapel Royal, Whitehall, and given to St. James's Church by William and Mary in 1695, has been for some time under repair by Messrs. Bishop and Sons; it was reopened on Tuesday evening by Sir Walter Parratt.

The prizes offered by the Corporation of the City for the best designs for a medal to commemorate her Majesty's Diamond Jubilee have just been awarded:—First prize, £20, to Messrs. Spink and Son, Gracechurch-street and Piccadilly; second prize, £15, to Mr. J. Gamble, 24, Rich-terrace, South Kensington; and third prize, £10, to Mr. A. B. Sykes, 16, Perry-hill, Catford. There were 16 designs sent in, and 14 were accepted for competition.

The Deritend Branch Free Library at Birmingham, which has been partially reconstructed and extended, was reopened on Saturday afternoon by the Lord Mayor. The old building was ill-lighted and ill-ventilated, and the accommodation was very inadequate; but now a lengthened, light, and commodious news-room and library have been provided. The total cost of the alterations was £1,500. Mr. J. A. Cossins, of Birmingham, was the architect for the enlargement.

The Plumstead Vestry are about to commence the sewerage scheme for Shooter's Hill district, and also to construct an underground convenience for both sexes by Plumstead Railway Station, in accordance with plans prepared by their surveyor, Mr. W. C. Gow.

New offices for the school board of Newport, Mon., have just been built in Charles-street in that town. The buildings, which also include a pupil teacher's centre, are English Renaissance in style, and are faced in red brickwork, with red Mansfield stone for dressings. Messrs. Conyers, Kirby, and Son, of Newport, are the architects, and Mr. J. Linton, is the contractor. The outlay has been about £6,000.

Building Intelligence.

Armley, Leeds.—A Methodist New Connexion Chapel in Hall-lane, Armley, was opened last week. The total cost of the chapel and the adjoining Sunday-school, which has been open since September last, has been £3,850. The site of the buildings covers an area of 925 square yards. The style adopted is a plain treatment of Gothic. The chief external features are a tracery window in the front gable and a square tower with octagonal spire. The chapel, which consists of nave and side aisles, is 52ft. long by 39ft. wide, a deep recess behind the pulpil forms the organ and choir-chamber, and over the vestibule is a small end gallery. A clerestory runs the whole length of the nave, supported by iron columns and wrought-iron stanchions, filled with wood framing, and leaded lights. Between the columns are plastered, moulded arches. The woodwork is of yellow pine, varnished, the pulpit and communion railings being of English oak. The chapel provides accommodation for 410 persons. The school, situated behind the chapel, consists of a central hall, 52ft. long by 28ft. wide, out of which five classrooms open. The minister's vestry and a caretaker's house are placed between the chapel and the school. In the basement is a room for cooking. The architect is Mr. W. S. Braithwaite, of South Parade, Leeds.

Birmingham.—A new theatre is about to be provided for Birmingham, on the site now occupied by the circus in Corporation-street, from plans by Mr. Frank Matcham, of London. The Corporation-street frontage will be devoted to eight shops, with either residential chambers or offices above. The property on the Dalton-street side will be utilised as warehouses and business premises. The stage, at the James Watt-street end of the site, will be 70ft. wide by 45ft. deep, with dressing-rooms, scene-dock, dynamo-room, &c. The pit, which will be on the floor level, will provide accommodation for 800 persons, with 150 stalls in front. The dress-circle and stalls will be reached by a vestibule and staircase in marble and mosaic, opening out at the corner of Corporation-street and Ryder-street. A novelty will be noted in the placing of the five private boxes at the extreme back of the circle, though there will almost of necessity be a couple of stage boxes in the accepted position. The dress-circle will seat 275 persons. A lounge and promenade will extend from the ends of the circle to the stage boxes on either side, fronted with alcoves. The refreshment buffet will be reached through a foyer, and beyond will be erected a conservatory, arranged as a winter garden. In the upper circle, and in the gallery above, the accommodation will be on proportionate lines, and refreshment rooms and cloak-rooms will be provided for each section of the audience. The scheme of decoration will be Moorish throughout. The cost of the buildings is estimated at £50,000 or £60,000.

Clerkenwell.—On Friday evening the Lord Mayor paid a state visit to the building in St. John-street-road, Clerkenwell, known as the Northampton Institute. The foundation-stone was laid on July 9, 1894, and the gymnasium, swimming-bath, large public hall, library, reading room, and workshops are now in occupation. The site is 1¼ acres in extent, and is triangular in shape, the apex of the triangle resting upon Northampton-square and the base upon St. John-street-road. The block of buildings in St. John-street-road contains the main entrance in the centre, on the north the large hall, and on the south a four-story building, chiefly consisting of rooms devoted to the social and recreative work of the institute. The northern side of the triangle, extending from St. John-street-road to Northampton-square, along Lower Charles-street, consists of the buildings which contain the bath and the gymnasium, each of which is 120ft. long. The former has dressing-rooms beneath, and the latter has over one end of it a three-story building devoted to educational work. The southern side of the triangle, in Ashby-street, contains a five-story building devoted to educational purposes. These buildings inclose a courtyard, from which the inner rooms and corridors derive their light. The various floors are reached by three staircases placed at the angles of the triangle formed by the courtyard. Over the main entrance there is a tower supporting a bracket clock, and containing in the belfry a heavy peal of bells forming the chimes and hour-bell of the clock. The architect for the building was Mr. E. W. Mountford, of Buckingham-street, Strand, and the cost has been about £80,000.

Cockfield Hall.—The works in the partial rebuilding and enlargement of Cockfield Hall, Yoxford, East Suffolk, the seat of Sir Ralph Blois, Bart., which have taken upwards of two years and a half in execution, have just been completed. The new entrance hall is open from the ground floor to the first-floor ceiling, and has an arcaded gallery at the first-floor level. On the ground floor the hall is subdivided by an arcade of three wide arches, access to the first floor being by a wide staircase, elaborately treated and carved. The reception-rooms all open into the hall, and are fitted up in harmony therewith. The ancient Tudor wing remains intact, the portions pulled down being comparatively modern additions, of no architectural interest. The mansion has been redecorated throughout. The work has been executed from the designs, and under the superintence, of Mr. E. F. Bisshopp, of Ipswich, architect and diocesan surveyor. Mr. Alfred Brown, of Braintree, was the contractor.

Edinburgh.—The range of new conservatories which has been erected at the Royal Botanic Gardens, Edinburgh, was opened on Sunday for the first time. The range of glass buildings has a frontage of 340ft., and the main building, which is on the west side, is open from end to end for that length. At right angles to it, on its east face, are four conservatories, 64ft. in length by 24ft. in breadth; and rising over the central house is a dome with annexe, around which the other buildings are grouped. The first of these buildings on the south is devoted to the culture and exhibition of stove plants, the second to orchids, the third to economic plants, and the fourth to succulents and plants from dry regions. A new system has been adopted in the Botanic Garden conservatories for the last year or two—viz., to set the plant or shrub in the earth and not confine its roots within the limits of a pot or tub. The plants grow much larger, send out fresher foliage more frequently than under the old plan, and give to the houses a more furnished appearance. The cost of the erection of the new greenhouses has been over £2,000.

Forest Hill, S.E.—Work is about to be begun upon the Horniman Free Museum, Lordship-lane, which its founder, Mr. Frederick J. Horniman, M.P., intends to present as a free gift to the inhabitants of the district. The building will consist of two galleries, each upwards of 100ft. long, lighted from the top. In addition, there will be a lecture-hall, having a seating capacity for 300 persons. Altogether the museum, including the administrative block, will be some 300ft. in length; its front will be constructed entirely in stone, and there will be a clock tower over 100ft. in height. The galleries will be divided into various courts, each devoted to a separate class of the objects of which the museum proper consists. Thus there will be a pre-historical court, an Egyptian court, an Indian court, a colonial court, a Japanese court, and so fourth, while there will be special departments for the zoological and entomological specimens as well as for the library. Fifteen acres of land surrounding the dwelling in which the collection is now housed will be converted into a public park and recreation ground, while Surrey Mount, an existing mansion therein, is to be fitted up as a free library and clubhouse. Mr. C. Harrison Townsend is the architect of the new museum.

Leeds.—A Home and Schools for Blind and Deaf Children is being erected by the Leeds School Board in Blenheim-walk, off Woodhouse-lane. The building, the plans of which have been prepared by Mr. W. S. Braithwaite, of Leeds, will cover an area of 1,200 square yards. The style is a free treatment of Gothic. The structure will be three stories high, with the addition of a good part basement lighted from wide areas, and a sub-basement for heating and ventilating arrangements. Each department will be separate in its working for scholastic purposes. The accommodation provided is for 100 boarders and 100 day scholars. The building will be faced with pressed brick, with sandstone dressings, except the main entrance, which will be of Morley stone. The roofs will be covered with Westmoreland slates. The building, together with the site, will cost £28,000.

Stranraer, N.B.—The new United Presbyterian Church was opened on Wednesday week. It has been rebuilt on the site of one erected in 1840 in London-road, of the plain square box type then in vogue. The new building is designed in Late Decorated style. The walls are of dark-blue dressed whinstone, with hewn work of a cream-white stone from Prudham Quarry, Northumberland. The roofs are covered with sea-green slates, finished with red-ridge tiles, and the roof of the stair-turret is covered with dark-red tiles. The main gable faces the street, the principal entrance being in the centre by a wide double doorway, with moulded arch, and tympanum filled with sunk panelling. On each side are mullioned windows. Over the main entrance is a five-light window, the upper part filled with rich tracery; and in the upper part of the gable is a moulded niche over a carved corbel. On the western side of the main gable the gallery staircase is carried up in an octagonal tower, ending in a steep conical roof covered with red tiles. The hall and other rooms form an angle to the south and west of the church, and are similar in architectural treatment. The church is divided into nave and side aisles by stone piers and arches, the piers also carrying the galleries, which are placed behind them at the sides, and supported on steel girders. The roof construction is exposed and of dressed timber, the ceilings all wood lined, and pulpit recess is formed at south end of church with stone columns and a moulded arch over it, and the upper part has a traceried three-light window. Sittings are provided for 530 persons; the hall seats about 300, while the session house can also be opened into it when required. There are also provided ladies' room, vestry, kitchen, and heating-room, with cloakroom and lavatory accommodation. The gas-lighting is by coronæ suspended from the ceiling and brackets on the lower side walls, all designed in hammered iron and copper. The church has been fortunate in gifts of stained-glass windows. The pulpit window has been designed and executed by Messrs. Stephen Adam and Son, Glasgow; the large five-light window by Mr. Joseph Miller, Glasgow; while a four-light memorial window is from the same studio. The total cost of the church, exclusive of the gifts mentioned, will be about £4,000. The architect is Mr. John B. Wilson, A.R.I.B.A. and I.A., Glasgow, and the work has been executed under his supervision.

CHIPS.

Dr. Charles Waldstein, Fellow of King's College, Cambridge, was re-elected on Wednesday to the Professorship of Fine Art on the Foundation of Mr. Felix Slade, for a second period of three years.

On Thursday in last week, under the direction of the Local Government Board, an inquiry was conducted by Colonel Coke, M.I.C.E., at Barnet, into an application made by the urban district council to borrow £4,102 for sewerage purposes.

The sum of £6,093 has been raised for the building fund of the west front and Victoria Porch proposed to be added to Manchester Cathedral, from the designs of Mr. Basil Champneys. Of this sum Sir William Cunliffe Brooks has contributed £2,000. This special fund is in addition to the £50,000 which was raised mainly by Sir J. W. Maclure for the restoration of the cathedral.

A public hall to seat 450 people is now in course of erection at Pitsea, Essex. The architect is Mr. Arthur T. A. Bowyer, of 90, Leadenhall-street, London, and the builder is Mr. Joseph Bayliss, of Forest Gate, E.

The Pennsylvania Railway station at Jersey City, opposite New York, was burnt on Monday morning. The buildings covered four acres, and included station buildings five stories in height, and a huge iron construction covered with a glass roof. The flames also destroyed the pier adjoining, where there was a landing-stage for four lines of ferry boats.

Mr. G. A. R. Fitzgerald and Colonel Boughey, C.S.I., Light Railway Commissioners, sitting at the Hampstead Vestry-hall, Haverstock-hill, on Saturday, concluded a three days' public inquiry into a scheme for connecting Finchley and Hendon with Hampstead by means of a light railway, otherwise an electrical tramway, along the Finchley-road, starting from Canfield-gardens, South Hampstead, near three railway stations. The scheme was opposed by the Hampstead Vestry, a committee of Hampstead residents, the London County Council, and the Finchley Urban District Council, but was supported by the Hendon Urban District Council. The engineers were Sir Douglas Fox and Mr. Wragg. The commissioners said that the necessity for the light railway had not been proved, and they therefore declined to grant an order for its construction.

Engineering Notes.

Scarborough.—The new sea wall for the Marine Drive has been constructed as far south as Coffee Pot Rock, a distance of about 400 yards from the existing Royal Albert Drive, and there are already manufactured blocks for 250 additional yards. The date fixed for the completion of the contract is August, 1899, and both Mr. J. E. Everett, the resident engineer, who looks after the interests of the corporation in the matter, and also the contractors (Messrs. Cooke and Co., Battersea), are of opinion that the work will be completed by that time. £10,000 has already been paid on account of the contract (£69,270), so that, allowing for retention money, more than a sixth of the labour has been performed.

Swansea Docks.—The Marchioness of Worcester recently laid the memorial-stone of a dock extension at Swansea. The Prince of Wales Dock has been opened only 15 years, but three years ago it was found inadequate to meet the rapid growth of shipping in the port. Beyond carrying out extensions of other docks, it was decided to extend this particular dock so as to increase its wharfage space by 50 per cent. This addition has now been completed by Sir John Jackson, contractor, at a cost of about £70,000. The whole quay frontage on the north side of the enlarged dock has been let to the Great Western Railway Company and to the Rhondda and Swansea Bay Railway Company for the shipment of coal, the former company occupying the western, and the latter the two eastern coal tips, with frontages of 260ft. and 400ft. respectively.

CHIPS.

The urban district council of Shanklin, I.W., have elected Mr. Ernest Charles Cooper, son of one of the members, as surveyor, at a commencing salary of £120.

The Workington Docks and Railways Bill, which involved an expenditure of half-a-million of money, has been withdrawn from the present session of Parliament.

Alterations are being made to Sedgfield Asylum, Co. Durham, embracing the ventilation, which will now be carried out on the Boyle system.

Messrs. Harry Hems and Sons, sculptors, of Exeter, have received instructions from a Guernsey Committee to prepare and erect a massive monument of grey granite. The memorial will be placed upon the rocks at Guernsey, overlooking the spot where the recent disaster to the *Channel Queen* occurred, and upon its sides will be recorded in metal letters the story of the wreck, and the names of all those who perished.

On Tuesday morning a fire broke out in a timber-yard belonging to Mr. Matthews, builder, of Nantwich. Five stacks of timber, principally pitch-pine and Californian red wood, valued at £1,500, were entirely destroyed. The fire is supposed to have been the work of an incendiary, or of some tramp, who took shelter in the timber-yard, which is isolated.

The East Sussex County Council have received a report from a committee recommending the acquisition as a site for a new county lunatic asylum of about 400 acres at the Park Farm, Amberstone, in the parish of Hellingly. The report was adopted.

The House of Lords' Committee, presided over by Lord Rookwood, resumed its inquiry on Thursday into the proposal made by the Midland Railway Company in their omnibus bill to take power for widening their line between Leeds and Bradford for a distance of 2¾ miles. The clause was passed.

Colonel A. J. Hepper, D.S.O., R.E., held an inquiry at Conway on Tuesday touching an application by the town council to the Local Government Board for approval to a loan of £1,500 for the purposes of municipal buildings, and £310 for gas-works purposes.

Mr. G. S. Elliott laid on Wednesday the foundation-stone of a new infirmary for Islington at Highgate Hill, which is about to be erected at an estimated cost of £250,000. The new infirmary is to be built on the site of the Highgate Small-pox Hospital.

A London syndicate contemplates spending a large sum of money in erecting sea-defence works and developing the southern end of Cleethorpes. The scheme includes the laying-out of winter gardens, and a recreation-ground with a 50ft. front road. Terms have been offered to the landowners interested, and negotiations have been entered into between the syndicate and the Cleethorpes District Council.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—R. C. and I. M.—Tangye.—D. S. R.—J. P.—J. M. and Co.—F. Bartlett.

Intercommunication.

QUESTIONS.

[11922.]—**Cleaning Headstones.**—Could any reader tell me the best method of cleaning headstones that have gone black? I have been told some people use an acid in cleaning; if so, could reader give me the name of the acid and how to apply it?—Stonemason.

REPLIES.

[11916.]—**Dry and Wet Rot.**—There is no remedy for dry-rot; the only way to get rid of it is to cut out all the affected parts and provide ventilation, with freedom from damp, to all the woodwork. Wet rot does not spread like dry rot, and the removal of the cause of dampness which produced it will also remove the infection. It may be prevented by preparing the wood in some way by injection of creosote or other patent preparations—Louis Erwold.

[11916.]—**Dry and Wet Rot.**—The only remedy is to cut out the affected parts, and substitute new work. Several preventive solutions have been given in the Building News.—H. W.

[11919.]—**Hygeian Rock Building Composition.**—The manufacturers of Hygeian Rock Composition claim that by building a wall as they advise, 9in. walls are equal in strength to 18in. walls, and, therefore, where strength is required, it would be best to put the composition into the middle of the wall about ½in. thick.—Louis Erwold.

[11919.]—**Hygeian Rock Building Composition.**—This composition can be applied to walls very easily. Let the existing wall be a 9in. or 14in. wall, which it is desired to protect from damp; build up an inner or outside casing of 4½in., after raking out the joints of the old wall, and then pour the composition in at intervals after three courses of the casing are built. Mr. White, I believe, has patented a wall lining which can be applied to any damp wall. The inside joints of wall are all raked out, and a frame is put up for fixing special-made locked tiles. As these tiles are fixed the hot composition is poured in between; when it has cooled the tiles adhere firmly to the wall, and form an impervious lining. As the tiles are rough or honeycombed on the surface, their face can be cemented or plastered. The mode of doing this is described in a pamphlet that can be obtained of the patentee. For new walls that are being built it is necessary to allow a ¾in. or ⅞in. cavity between the two thicknesses. The joints should be raked out so that the composition may "key" in. It should be poured into the cavity every three or four courses. For tanks it is desirable to apply the composition between a 4½ brick inside lining erected after the main walls are built, after raking out joints. Send for particulars to Mr. W. White, Abergavenny.—G. H. G.

[11919.]—**Hygeian Rock Building Composition.**—The Hygeian Rock should be applied in between two walls in new work, but may be applied internally to existing buildings. If querist (G. Williams) will write to White, Great Western Works, Abergavenny, he will send him pamphlet giving full particulars on every point.—Surveyor.

[11920.]—**Hollow-Wall Ties.**—I should advise "Damp Proof" to use wrought-iron galvanised or cast-iron wall ties, many of which are in the market. These are generally made with forked ends to give a better hold in the brick joint. Glazed stoneware ties are made by Doulton and other makers perforated, but the cavity ought to be cleared out as the work proceeds. The ties should be inserted every three or five courses in height, and be placed about 2ft. 6in. apart. The cavity should be about 2½in.—G. H. H.

[11920.]—**Hollow-Wall Ties.**—I have found that a strong galvanised wrought-iron tie is most serviceable, and that 2½in. is quite enough space to leave between the two walls. It is best to place the ties about 3ft. apart horizontally, and 9in. vertically, every other row being shifted 18in. along horizontally so as to make vertical lines of ties 18in. apart. More ties should be provided for the angles of buildings, so as to make them stronger.—Louis Erwold.

[11920.]—**Hollow-Wall Ties.**—Replying to "Damp-Proof," I advise him not to use wall-ties in hollow walls. They are most objectionable, and a lodgment of mortar upon the ties would defeat his purpose. Write to White, Great Western Works, Abergavenny, and get one of his pamphlets.—Architect.

[11921.]—**Facing Bricks.**—"L. O." may use best marl stocks, Fareham reds, or Suffolk white bricks. These bricks are to be built with a flat parallel ruled joint, or tuck-pointed afterwards. Many facing bricks are to be had of good quality. The Hartshill Brick and Tile Co., Stoke-on-Trent, or R. M. Whiting, Faversham, Kent, or T. Lawrence's hand-made facings supply excellent facing bricks.—G. H. G.

A memorandum by the Indian Government shows that 800 miles of new railway have been opened during the present financial year; 1,500 miles will be opened next year.

Extensive damage was occasioned on Tuesday morning by a fire which broke out in the timber-yard in Wenlock-street, City-road, belonging to Messrs. Esdaile and Co., sawmills proprietors. A building of two and three floors, about 100ft. by 50ft., was burnt out.

The Wandsworth Guardians, having received the necessary sanction to expend a sum not exceeding £11,409 for the purposes of a nurses' home, have decided to take steps to have the home erected at the infirmary forthwith.

Sir George Meyrick, the ground landlord of Bournemouth, has entered into a provisional agreement with a speculative syndicate to make over to them the Eastern cliffs, the narrow beach, and the foreshore. It is proposed to construct on the beach a wide drive, a footpath, and behind these to erect a row of houses about a mile long, to effect which it will be necessary to cut back the cliffs very largely, and to convert this seaside resort into a second Margate.

A new Jubilee clock has been placed in Kilham parish church tower by Messrs. Potts and Son, Leeds. Messrs. Potts are also making new clocks for Hedon, Flamborough, North Ferriby, and Whitby Abbey churches.

A terrible disaster occurred at noon on Friday at Edinburgh, the scene being the Waverley hotel building which is at present being erected by Messrs. G. and R. Cousin, of Alloa, builders, for the North British Railway Company at the corner of Princes-street. A huge scaffolding had been erected 60ft. high from the beams on the first floor, and a crane and donkey engine had been put on the top of the structure. Without any warning, the whole concern collapsed with a mighty crash into the centre of the building, carrying with it 15 workmen. Four men were killed and three others very seriously injured.

At a special meeting of the town council at Leicester on Wednesday week, the chairman of the Finance Committee announced that the council had voted £160,000 for street improvements during the past 28 months; had devoted £230,000 more during the same time to the acquisition of parks, lunatic asylum, cemetery, and baths, and had spent £183,000 on the extension of the gas and electric-lighting plant, making an aggregate of £573,000. At the same meeting special committees were appointed to consider the expediency of acquiring the Leicester tramways and erecting a block of two-story buildings for the housing of the aged poor at rentals not involving any charge upon the rates. It was also decided to spend £6,200 on the maintenance of the Municipal Technical and Art Schools.

PARLIAMENTARY NOTES.

New Government Offices: Proposed Expenditure of £2,500,000.—An important statement as to the required new Public Buildings in London was made on Thursday night in last week by Mr. Akers Douglas, First Commissioner of Works, before a Committee of the House. At present, he said, many of the Government Departments were scattered about Westminster, in houses temporarily rented for the purpose. For instance, the War Office occupied eleven separate buildings, all old and insanitary, and widely scattered, and the Board of Trade eight or nine buildings, while the Home Office and the Education Department were similarly situated. It was evident that the state of things was inconsistent with good administration. It was equally inconsistent with economy, for no less than £16,000 per annum was expended in the rent of these temporary buildings, and land of a still larger rental value was lying unused. The Government had determined to put an end to such a state of things, and they therefore proposed to introduce a Bill sanctioning the necessary expenditure for the acquisition of sites for suitable buildings, and for their erection. They asked first for a sum of £475,000 for the building of the War Office on the Carrington House site, which was amply large enough for this purpose. It contained an area of 75,000sq.ft. They further asked for a sum of £60,000 for the erection of buildings on the Parliament-street site, and another £100,000 for the completion of the purchase of that site. The scheme carried with it the widening of Parliament-street. In addition to this, they also proposed to place in the Bill the money still required for the completion of the Admiralty. As it now stood, £125,000 was wanted to complete that building according to the original plan and estimates; but owing to the very large increase of the Navy in recent years, it was necessary to provide for the corresponding increase of the staff at the Admiralty. They, therefore, asked, in addition, for £150,000 to provide for this extension. They already possessed the necessary site upon which the extension should be placed. A further sum of £300,000 was required for additional Post Office buildings. It was proposed to obtain for this accommodation the building now occupied by the Savings Bank Department in Queen Victoria-street. The building was barely large enough for the present work of that department, and was quite unequal to any expansion which would shortly be required. A fresh site for housing that Department had been obtained at West Kensington. Lastly, they asked for £800,000 for the completion of the buildings at South Kensington connected with science and art. The settlement of this question had been demanded by this House and by the public for many years past. In 1891 a decision was come to to proceed with the building to complete the accommodation for the Art Museum, and for housing the administrative Departments of Science and Art. Plans were accordingly prepared by Mr. Aston Webb, and accepted, for a building to occupy the land on the south side of the Museum, facing Cromwell-road. But the resources at the disposal of the Chancellor of the Exchequer on both sides of the House, unfortunately, did not permit of the grant of the necessary funds, and the scheme had since then been in abeyance. Since that scheme was formulated, it was in contemplation to move to the Education Office the Secretariat of the Science and Art Department; and, further, in accordance with the recommendation of the Select Committee of last year on the South Kensington Museum, it had been decided to remove the official residences and certain other temporary buildings, which were a source of danger from fire. With this additional space at disposal, it was now possible to provide on the eastern side of Exhibition-road the necessary accommodation for both Art and Science. It is, therefore, intended to build an addition to the building proposed in 1891, which would complete the frontage on both the Cromwell-road and Exhibition-road sides, and which would amply meet the requirements of both branches of Art and Science for many years to come. These items brought the total up to the large sum of £2,550,000; but there would ultimately be a very considerable set-off to this figure—of probably over a million—by the release and disposal of the War Office buildings and sites in Pall Mall and those of the Board of Trade in Whitehall. After some discussion, the resolution was adopted by 265 votes to 15.

South Kensington Museum. — Mr. Bartley asked the First Commissioner of Works on Monday whether any further plans had been made for the completion of the South Kensington Museum, and, if so, by whom; and whether he would have copies placed in the tea-room before they were finally accepted. Mr. Akers-Douglas: Mr. Aston Webb, who in 1891 prepared the plans for additions to the museum, will be instructed to draw up revised plans, and hon. members will have an opportunity of inspecting them before they are finally accepted. Lord Balcarres asked the First Commissioner of Works whether, in connection with his statement about new buildings for the South Kensington Museum, it was to be understood that the science collections now housed on the west side of Exhibition-road were to be moved to the new buildings to be erected on the east side of Exhibition-road; whether it was also proposed to move the Indian and Oriental collections to the new galleries; and what was proposed to be done with the large extent of land upon the west side of Exhibition-road, and the buildings now occupied by the science collections? Mr. Akers-Douglas: With regard to the first and second paragraphs, the answer is in the affirmative; and with regard to the third paragraph, I can only say that it is a matter which will receive the attention of the Government when the new buildings it is proposed to erect approach completion.

CHIPS.

About six acres of ground have been acquired by the North British Railway Company adjoining their passenger station at Possilpark, in the northern district of Glasgow, and it is intended to construct a large goods station there. The plans provide for station sidings, including goods shed and double loading bank, with offices.

A special dedicatory service was held on the 24th inst. at Garforth church, Yorks, by the Rev. Canon Hope, upon which occasion a memorial stained-glass window was unveiled. The window has been erected to the memory of Mr. A. S. R. Archer, of Garforth, by his widow, and it contains subjects of the Ascension and Resurrection of Our Lord, besides smaller pictures connected with these final events. The work is from the studio of Messrs. Powell Brothers, of Park-square, Leeds.

The Expanded Metal Co., Ltd., has just received an important order for a large quantity of expanded steel to be used in an extensive area of concrete warehouse floors in Manchester, according to one of their patented designs, a construction that constitutes an improvement upon the Monier system.

The Bill for the National Registration of Plumbers was introduced into the House of Commons by Mr. Lees Knowles, on Thursday night in last week, and was read a first time.

Sir William Fraser, formerly Deputy Keeper of the Records of Scotland, and a well-known antiquary and genealogist, who died last week, has, by his will, left to the University of Edinburgh £25,000 for the foundation of a Chair, to be called the Sir William Fraser Professorship of Ancient History and Paleography; £10,000 for the purpose of the library; and one-half of the residue of his estate, which is expected to amount to between £9,000 and £10,000, for general requirements, bursaries, research, publications, &c.

A monument to the late "Red Prince," Frederick Charles of Prussia, was unveiled on Sunday in Metz. The bronze statue of the Prince, of heroic size, stands on an octagonal pedestal more than 20ft. high.

Colonel C. H. Luard, an inspector of the Local Government Board, held a long inquiry at Ossett, on Friday, concerning the application of the corporation for sanction to a loan of £4,200 for the purchase of property as a town hall site. In 1896 it was proposed to build upon another site, but the Local Government Board objected. It was elicited that the corporation was equally divided upon the purchase, which was carried by the casting vote of the mayor.

The Duke of Norfolk, on Saturday, laid the foundation-stone of the Roman Catholic Hall and Club, Westminster Bridge-road, which is to be erected and fitted as a social and recreative institute, in connection with St. George's Cathedal, Southwark. The ground floor of the building will consist of a spacious hall for the purposes of public meetings, lectures, and entertainments; the first floor will become the quarters of the men's club, and the second floor will provide a home for the juniors' club.

The new wing to the Marlborough College sanatorium, Marlborough, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The North Warwickshire Water Bill, an unopposed measure which has been read a second time in the Commons, came, on Friday, before Mr. J. W. Lowther, chairman of Ways and Means. Its object is to supply water to the parish of Foleshill and adjacent places in North Warwickshire, at an estimated outlay of £21,620. The preamble was proved by Mr. Joseph Quick, engineer. The Bill successfully passed through Committee, and was reported for third reading.

A stained window, given by Miss Wright, of Whitworth Park, Manchester, to Alford Church, was unveiled yesterday (Thursday) by the Bishop of Lincoln. It is in the south aisle, in what was formerly the Lady-chapel. The subject is the Annunciation. The window is by Messrs. Heaton, Butler, and Bayne.

LEGAL INTELLIGENCE.

The Unseen Wire and the Architect's Silk Hat.—Huntly-Gordon v. the Standard Time, Company (Limited).—In this case, heard on Friday, by Mr. Justice Stirling, in the Chancery Division the plaintiff, Mr. Herbert Huntly-Gordon, an architect, sought an injunction restraining the defendant company from fixing any wires or cables to his premises in Cheapside, and he claimed damages for an alleged trespass. Mr. Jenkins, Q.C., for the plaintiff, said the Standard Time Company's business was for synchronising clocks in London, and those of the various clock and watchmakers by means of electrical connection made with the Observatory at Greenwich. The plaintiff had acquired 60, Cheapside, and on December 18, 1896, he went on to the roof, which was very high. Without knowing anything of the presence of a wire he ran violently against one and fell. By three feet he missed a well 50ft. deep. Had he fallen into it, he might have been killed. His hat was damaged. His case was that the defendants had put up the wire without leave. Correspondence was read, in which the defendants offered the plaintiff liberty to go into any hatmaker's to make a purchase, and in this way replace his damaged property. This plaintiff refused, and he brought his action by way of protest against what he alleged to be the high-handed proceedings of the defendant company. Mr. Justice Stirling, in giving judgment, said he should assess damages for trespass merely. As the wire had been removed, there was no further need for the injunction, and the sum of two guineas, paid into court, was sufficient recompense to the plaintiff. The costs would have to be borne by the defendants up to January 22, and subsequent to that date, when the offer of compensation was made, the plaintiff would have to pay the costs.

The Use of Subways. — London County Council v. London Hydraulic Company.—This appeal, heard on Friday, was made by the defendant company from a decision of Mr. Justice Wrightand Mr. Justice Kennedy, sitting as a Divisional Court, deciding that the company were liable to pay charges at the higher scale in respect of their use of certain subways under Queen Victoria-street, Victoria Embankment, Northumberland-avenue, Shaftesbury-avenue, Charing Cross-road, Southwark-street, and Rosebery-avenue. In the action, the County Council sought to recover from the company £185 5s. in respect of their water-pipes placed in these subways. The question was whether the defendant company was a "water" company, for if it was, as the company contended, then the charge for the use of the subway would only be £32. The County Council had statutory power to fix the scale of fees and charges to be paid by any company using any of these subways, and a scale of charges was accordingly drawn up. One table consisted of the charges to be made on water and gas companies having power to break up streets, and the other of the charges for companies, bodies, and persons other than water or gas companies, with similar power. The latter was the higher scale. The company was constituted under the Wharves and Warehouses Steam Power and Hydraulic Pressure Company's Act, 1871, for applying motive power by hydraulic pressure to waterside and land cranes used for working lock-gates and other machinery: but, unlike any other water company, they were bound to return all water, after it had been used by them, to the river again. The Court dismissed the appeal, being of opinion that the Hydraulic Company was not a "water" company, and was liable, therefore, to pay as a company other than a water or gas company having power to break up streets.

Re Francis Morton and Co., Limited, in Liquidation.—The Pearson and Knowles Coal and Iron Company's petition for the compulsory winding-up of this company came before the Vice-Chancellor of the Chancery of Lancashire last Monday morning, and on the application of the petitioning creditor it was adjourned for a week. Creditors representing an aggregate of debts of £10,633 have instructed solicitors to oppose the petition, and they will be represented on the hearing. So far, the receiver and liquidator says he has no intimation from any creditor of his intention to support the petition. There are still a number of creditors who have not intimated their views one way or the other, and we should think most of them will agree with us, that it is time the company was wound up by somebody!

"Duroline" not Watertight.—In the Queen's Bench Division, on Friday, before Mr. Justice Matthew and a special jury, Mr. Arthur Firth, proprietor of a hydropathic establishment near Little Orme's Head, brought an action against the New Wire Wove Roofing Company, Limited, for damages by reason that some "Duroline" which the defendants had supplied was not equal to warranty, and not fit for the purpose for which it was supplied—the roofing of two tennis-courts. The defence was, first, a formal denial that the warranty was given, or, alternatively, that if it was given, it was true. Another defence was, that the

reason of the failure of the material was that the roof, as constructed by the plaintiff's architect, was insufficient for the purpose, as it vibrated and opened the joints. The reply to this on the part of the plaintiff was that the roof had been seen and approved by the defendants' representative before the work was entered upon. In the result the jury returned a verdict in favour of the plaintiff for £350. Judgment was given accordingly, with costs.

Builders' Duties and Responsibilities.—Bennett v. Castle and Son.—In the Court of Appeal, last week, Lord Justice A. L. Smith, Lord Justice Chitty, and Lord Justice Collins gave judgment in this application by the defendants for judgment or a new trial in an action tried before Mr. Justice Lawrance and a common jury. The action was brought to recover damages for personal injuries owing to the alleged negligence of the defendants' servants. The defendants were contractors who were engaged in doing certain work at a private house from the end of September, 1896, until November 24, 1896, when the accident happened. After each day's work was over, the ladders were fastened together and laid on and at the side of the path leading to the back door of the house. The plaintiff was a baker who delivered bread at the house in question, and between 6 and 7 p.m., on November 24, 1896, the night being very dark, he walked up the path and delivered the bread, and when returning he stumbled against the ladders and fell, and was injured. The defendants' case was that, at first, the ladders were placed each night on the lawn; but the occupier of the house objected, and directed the defendants' men to place them on the path in question. The ladders were accordingly placed there, and the defendants contended that if there was any negligence at all, they were not liable. The jury were asked whether the ladders were placed there by the permission or by the order of the occupier of the house, and they answered, by the permission of the occupier, and they found a verdict for the plaintiff for £50 damages. The Court dismissed the application. Lord Justice A. L. Smith said that it was contended that the defendants' men, in putting the ladders on the path, acted as the servants of the occupier of the house, and not as the servants of the defendants. He could not agree with that contention. The answer of the jury disposed of it. The jury were asked if the ladders were placed on the path by the permission or by the orders of the occupier of the house, and they said that the ladders were placed there by the permission of the occupier. That meant that the ladders were not placed there by the orders of the occupier. That finding negatived the suggestion that the defendants' men, in putting the ladders on the path, were acting as the servants of the occupier of the house. There was evidence to justify that finding, and there was no ground for disturbing the verdict. Lord Justice Chitty and Lord Justice Collins concurred.

The Tower Bridge Approach.—Mr. Under-Sheriff Burchell and a special jury heard, at Red Lion-square, last week, the case of "Williamson and Joseph (Limited) v. the London County Council," a claim for about £8,300 as compensation for the leasehold interest in premises in Coxon-place, Horselydown, and for injury to the business of electrical engineers, which the claimants carried on therein. At the request of the parties the Under-Sheriff referred to arbitration the question of the value of the fixed plant, machinery, and tenants' improvements and the cost of removal and replacement of stock, stores, and loose plant. The questions left for the jury were, therefore, the improved rental value of the premises in question and the injury to the business. Among the experts who gave evidence for the claimants were Mr. Edward Stimson (Messrs. Stimson and Sons), Mr. Francis J. Bisley (Messrs. F. J. Bisley and Sons), Mr. Frederick Snee (Messrs. Bradshaw, Brown, and Co.), and Mr. Henry Shirley Price (Messrs. Wheatley, Kirk, Price, and Goulty). It was stated that the nearest suitable premises were at Highbury, and that in consequence of the great activity in the engineering trade, it would be impossible for the claimants to replace their machinery in less than three or four months. Sir William Marriott offered on behalf of the London County Council to allow the claimants to transfer the whole of their plant to the new premises. Mr. Dickens, Q.C., said that offer should have been made earlier in the proceedings; it was practically useless now. The case was adjourned till Wednesday, when the case for the County Council was opened by Sir William Marriott, who contended that £100 would amply compensate the claimants for any improved rental value which there might be in the premises for the remainder of the term, and that £250 in addition would cover any loss of business during removal from Coxon-place to Highbury. The experts who gave evidence for the Council included Mr. James F. Field (president of the Auctioneers' Institute), Mr. Adrew Young (valuer to the County Council), Mr. William Eve (Messrs. William Eve and Sons), Mr. Henry Stock, and Professor Henry Robinson (of King's College). The Under-Sheriff, in summing up, reminded the jury that the greater part of the claim had been referred to arbitration, and that they had only to assess the value of the leasehold interest and the injury to the business. The jury awarded £350 in respect of the leasehold interest and £1,100 in respect of probable loss of trade, making a total compensation of £1,450. The Under-Sheriff stated that he had appointed Mr. E. Terry Horsey (Fuller, Horsey, Sons, and Cassell) as umpire in regard to those items of the claim which are to be referred to arbitration—namely, the value of the fixed plant, machinery, and tenants' improvements, and the cost of removal and replacement of stock, stores, and loose plant. The arbitrators will be—for the claimants, Mr. Shirley Price; and for the London County Council, Professor Henry Robinson, and the amount of their award will be added to the sum of £1,450 awarded by the jury.

Neglecting to Abate Nuisance.—At the North London Police-court, before Mr. Cluer on Monday, 7th inst., Mr. W. H. Pocklington was summoned at the instance of the Islington Vestry for neglecting to abate a nuisance at No. 52, Canonbury Park South, under the Public Health Act, 1891. Considerable correspondence had passed between the vestry and the owner's architect, and a sanitary notice had been served by the vestry. Certain alleged nuisances mentioned on same had been remedied, others ignored, and the point now at issue was with respect to the sanitary condition of certain drains. The vestry's solicitor called the sanitary inspector, the superintendent of the Public Health Department, and the medical officer, Dr. A. E. Harris, to show that the drains, which all run outside the house, had been tested with a scent-test and found defective. The owner's solicitor, Mr. A. H. Hammond, called Mr. P. H. Adams, A.R.I.B.A., of 65, Leadenhall-street, E.C. to prove that he had tested the drain on three separate occasions and had found no defect. Mr. Gale, builder, of Hornsey-road, N., also gave evidence to a similar effect. Mr. O. C. Hills, A.R.I.B.A., of 147, Bow-road, E., also stated that he had tested the drains that morning and found no defect. The magistrate then adjourned the case, and announced his intention of visiting the premises on the 8th inst. and witnessing the test himself. This was accordingly done; but the test proved incoclusive, and it was arranged to again apply the test on Tuesday, the 15th inst, before the parties. This was carried out, and the magistrate could find no trace of the scent, and gave judgment for the defendant in court with £10 10s. costs.

Stedman v. Stedman.—In the Probate Division last week before the President, Sir F. Jeune, a petition was presented by the wife, Mrs. Helen Stedman, praying for the dissolution of her marriage with Charles Mason Stedman, an architect and surveyor, on the ground of cruelty and misconduct. There was no defence. Mrs. Helen Stedman said she was married to the respondent on April 15, 1874, at St. Barnabas' Church, Kensington, and they afterwards resided in the neighbourhoods of Clapham and Streatham. They lived happily together for some years, but eventually the repondent became addicted to drink, which habit unfortunately increased. In 1888 her father died, and she then came in for a substantial sum of money, but from that time the respondent had given up his profession, and had practically done nothing since. When the respondent was under the influence of drink he acted very cruelly towards her, and eventually hearing that the respondent was living with another woman she gave instructions for the present suit. She had received letters from him apologising for his cruelty to her. Evidence as to cruelty and adultery having been given by other witnesses, Sir F. Jeune granted a decree nisi with costs, and he also gave the petitioner the custody of the children.

At a general meeting of the Royal Society of British Artists, held on Monday, the following were elected members:—H. P. Clifford, William Kneen, Giffard H. Lenfestey, H. Childe Pocock, H. Kerr Rooke, and Henry Stannard. Mr. Carew Martin has been appointed to the post of Keeper.

A scaffold, over 50ft. in height, in course of erection at the new school of art buildings in Renfrew-street, Glasgow, was blown down on Friday by the force of the gale. A number of workmen were on the scaffold at various heights, but all escaped with slight bruises, with the exception of a joiner, Hugh M'Turk, who was engaged near the top of the structure. M'Turk fell on his head and sustained serious injuries, necessitating his removal to the Royal Infirmary.

A new lighthouse is being built for the Trinity Board on St. Mary's Island, off Carrey Point, Northumberland, and when finished in August next, the illumination of the present lighthouse at Tynemouth Castle (3¼ miles south) will be discontinued, and the building itself removed. The new lighthouse is circular on plan, white in colour, and 120ft. in height from base to vane. It will carry a white flashing light visible for 17 miles. Mr. J. L. Miller, of Tynemouth, is the builder.

WATER SUPPLY AND SANITARY MATTERS.

Arbroath Water Supply.—The works for the extension of the underground water supply of Arbroath have been at a standstill for many months in consequence of a difference with the contractors, Messrs. Paterson and Son (Limited), Glasgow, as to matters in connection with the carrying out of the work. The points at issue were recently referred to Mr. Mansergh, C.E., London, as arbiter, who, instead of an award, gave a report with a view to parties coming to an amicable arrangement. On Tuesday, at a meeting of the Water Committee of the Police Commission, Mr. M'Culloch, C.E., the engineer of the works, reported that he had arranged with the contractors to proceed with the work, and that the western portion of it would at once be resumed. The brickwork of the adit is to be strengthened by being made 14in. thick instead of 9in. so far as necessary through the soil which has been disturbed.

London Water Supply.—At Monday's sitting of the Royal Commission which is inquiring into this subject, Sir John Lubbock, M.P., was further examined. He admitted that the great majority of the water committee of the London County Council were favourable to a policy of purchase. He thought it would probably be a wise course to go far afield for a fresh supply; but it involved very intricate questions. He did not think it would be impossible for the companies to go to Wales for water. He contended that it was undesirable that an enormous work such as that involved in the administration of the water supply should devolve on the London County Council in addition to their present responsibilities. He calculated that the transfer of the undertakings of the water companies to the County Council would involve the ratepayers in a deficiency of £40,000 a year in addition to any expenditure that would be necessary for an additional supply. It was not entirely on financial grounds that he objected to the transfer of the water undertakings, as it was most important that there should be a watch kept over the purity of the water. Mr. Whitmore, M.P., the next witness, expressed the opinion that it was not in the public interest that large industrial undertakings such as those of the water companies should be owned and managed by the London County Council, so long as the Council remained a political body. The witness was still under examination when the commission adjourned.

Manchester.—The Rivers Committee of the Manchester Corporation, at a meeting held on Friday, discussed the "biological" system of treating the sewage at Davyhulme, which was recommended by a sub-committee. The calculations of a city surveyor, who has been instructed to prepare plans for proposed new works at Davyhulme, is that an outlay of £127,000 will be required for an area of 35 acres. The Committee decided to begin experiments on an area of four acres only, and a resolution was passed asking the Mersey and Irwell Joint Committee to sanction an extension of time which will enable the Corporation to carry out the works.

CHIPS.

The Haslingden Corporation have decided to acquire and lay out land at Rough as a cemetery at an estimated cost of £7,700, including site and chapels.

Mr. D. H. W. Powell, surveyor to the urban district council of Kingswood, near Bristol, has been appointed to a similar office under the district council for Witney.

A new organ was opened on Friday last in the parish church of Alveston. The instrument has been built by Messrs. Nicholson and Co., of Worcester.

The Duchess of Montrose will visit Cheltenham College on Friday, April 1, and unveil a statue of the Queen presented to the college chapel by Old Cheltonians.

A bronze statue of Sir William Gray, subscribed for by the inhabitants of West Hartlepool, has been placed on a pedestal facing the municipal buildings. The Earl of Durham will publicly unveil it to-morrow (Saturday).

In the case of Arthur Hollick, of Birmingham, builder, the order of discharge from bankruptcy has been suspended for two years, ending Feb. 17, 1900.

In the Dumbarton Dean of Guild Court on Monday plans were passed for an extension to the present County Buildings. The extension is to contain offices, meeting-hall, and committee-rooms, and will be built at an estimated cost of £4,000.

Major Cardew, an inspector from the Board of Trade, held an inquiry at the town-hall, Halifax, on Friday, with respect to an application from the corporation for sanction to borrow the sum of £20,000 for tramway purposes, chiefly to meet the cost of the proposed depot in Gibbet-street. Mr. Wilmshurst, the engineer, explained the proposals.

Our Office Table.

A Parliamentary Paper has been issued this week containing reports from Her Majesty's representatives abroad as to the statutory provisions existing in foreign countries for the preservation of historical buildings. In May, 1896, Lord Salisbury addressed a Circular Note to the British Ministers abroad, stating that the Royal Society of Antiquaries of London had appointed a committee to ascertain what steps could be taken to prevent the destruction, either by demolition or restoration, of historical buildings in this country. It appeared that in France there is an "Ancient Monuments Act," under which some seventeen hundred abbeys, castles, cathedrals, and other historical buildings were said to be scheduled, and cannot be touched without the consent of the Ministère des Beaux-Arts. Similar provisions are stated to exist in Switzerland and Austria. The society were anxious to know what Statutable provisions exist in various countries with regard to this matter, and how they work. Reports have been received from all the principal capitals, and they are included in the Paper just issued.

The report of the Fire Brigade Committee, laid before the London County Council on Tuesday, stated that the new firefloat which Messrs. Yarrow and Co. have undertaken to supply for £8,000, will be 100ft. in length, the beam 18ft., and the draught about 1ft. 7in., and it is estimated the speed will be from nine to ten knots. The fire-pumps will consist of four powerful Worthington duplex pumps, each capable of discharging 500 gallons per minute, any one or more of which pumps may be started as occasion requires, and worked at full power. These pumps will deliver into a discharge pipe connected with a water-tower in the forward part of the craft, and from which a series of branches will be carried with shut-off valves connected with any required number of fire hoses in action. On the top of this large air vessel will be mounted a water-tower ladder, the two sides of which will be formed by water pipes delivering at its topmost end and through two 2in. nozzles. The direction of these nozzles can be varied according to the instructions of the fireman at the top of the ladder by lifting, depressing, or swinging the water ladder from the deck.

A lecture on "The Workmen's Compensation Act, 1897," so far as it affects the employer and the insurance companies, was read on the 17th inst. before the Insurance Association of Manchester, by Mr. Charles H. Green, assistant secretary to the Sun Life Assurance Society, London. The lecturer pointed out that, by the present Act, our legislators had laid down, for the first time in this country, the doctrine that a workman in certain specified industries had a legal claim upon his trade for accidental injuries arising out of his employment, except such as were caused by his own wilful misconduct. Its provisions would come into force on the 1st of July next, when every employer would find himself saddled with new and great responsibilities, and the only advisable source of relief was offered by an indemnity from an insurance office. In order to fix a rate that should be satisfactory to all parties, it would be necessary to consider the number of workpeople killed and permanently disabled annually, the number and duration of the disablement costs, and the wages paid, and at present the data to go upon were very deficient. A committee of representatives of accident offices had been for some time past engaged in preparing a table of rates, which it was hoped would meet with the approval of all the interested parties. In the absence of direct statistics, and hampered by the indefiniteness of the compensation to be paid, their labours were not enviable; but the majority of the offices appeared to be working loyally together for the common good, and that it was hoped that a combination would be maintained which would be of incalculable value in the ultimate determination of the true rate for each particular risk, thus furthering the interests of the employers, and at the same time tending to establish the business of the companies on a sound basis.

Last week's business at the Mart, Tokenhouse-yard, was exceptionally good, considering the nearness of Easter, the total realisations reaching £207,783, against £66,578 for the corresponding week of last year. City properties readily found buyers, the principal transactions being the sale of a freehold with an area of 2,100ft. in Gracechurch-street at £12 per foot, and shop premises in the main Finsbury-pavement at £10 per foot. The sale of the week, so far as the provinces are concerned, was the disposal of the Golden Cock estate, Leeds, by Messrs. Hepper and Sons, for £32,600. The estate, which covers an area of 1,776 square yards, and which is let at a total rent of £850, consists of the fully-licensed inn, the Golden Cock, four shops in Kirkgate, and warehouses, cottages, workshops, and stables in Fish-street. The purchasers were the Leeds Estate Company, who have now acquired the whole of the buildings and land extending from Kirkgate to Lowerhead-row, with the exception of parts of the frontage to Briggate and Vicar-lane. The company intend making two new streets, several new arcades, and over two hundred shops. The carrying out of the whole project will involve an expenditure of half a million sterling.

The committee on Science and Arts of the Franklin Institute, of Philadelphia, has issued a report, giving an account of some experiments, which show that cast iron undergoes, with age, a remarkable change, increasing in tensile strength, often to a very great extent, as if certain internal strains, tending to cause brittleness, were gradually relieved. It has long been known that old castings were, as a rule, superior in tenacity to new ones, and this increased strength of old cast iron has often been attributed to the better quality of the old metal; but the metallurgy of iron is so well understood now that it is not likely that any valuable secrets of mixing metal have been so recently forgotten, and it is now evident that age alone accounts for the difference. The committee of the Franklin Institute, acting on these surmises, devised a series of experiments, to ascertain not only whether time produced such effects upon cast iron, but whether they were the same with all varieties of metal, and in addition, to study the conditions under which such effects were produced or hastened. The most important discovery made in this way was that the effect of age could be produced in a short time on cast iron by vibration, or repeated shocks, such as those which small articles receive by being rolled about together in the "tumbling-barrel" used in foundries for smoothing the rough edges of small castings, and that this effect might be an increase of a hundred per cent. in the tensile strength of the piece to be tested. So far, no important practical application of the new discovery has been made, but some Pennsylvania engineers have taken the precaution, in making specifications for iron castings, to stipulate that test-bars, from which the quality of the metal is to be ascertained, shall not be subjected to shock in a tumbling-barrel, or to mechanical vibrations of any kind, before testing.

Messrs. Hayward Brothers and Eckstein, Ltd., engineers and ironfounders, of Union Ironworks, Union-street, Borough, S.E., have issued a useful section of their catalogue on their improved circular and straight iron staircases. This firm's iron staircases hold a high place in the estimation of architects. We have designs of every kind of circular and straight staircases, in which the tread, riser, and spandrel are in one, giving increased strength and stiffness over the plan of making them in three pieces. The circular ones are made in seven different sizes, from 3ft. 6in. diameter to 6ft., and for right or left hand. In specifying, it is only necessary to state height from floor to floor, diameter, and if right or left hand, or give page of catalogue, &c. A great variety of tread and riser patterns is given, from plain close ribbed pattern to open scroll design. Some are made for hardwood cubes (square trellis pattern). Any of these patterns ought to be stated. Some of the patterns have a dado screen solid and plain or open scroll patterns. The balusters and newels are also shown in a variety of effective designs, from plain fluted or twisted bars to elaborate baluster designs or openwork panels. These iron staircases are very moderate in price, ranging from 19s. per foot rise for 4ft. 6in. diameter. The straight iron staircases are shown in several pages. They are often used from drawing-room windows to the garden, for hospital wards from the convalescent balconies, and for fire escapes. The illustrations show fire-escape staircases from the Boys' Home, Marylebone, a factory at Clerkenwell, and for floors from a warehouse. Hayward's sashes made in wrought and cast iron are shown, with sections of window-bars; also casements and frames, with sections of frames; wrought-iron doors to meet the requirements of the London Building Act for party-walls, &c.; steel-lined fireproof doors, and various kinds of ornamental wrought ironwork carried out by this firm.

The Treasury Department of the United States has prepared a list of buildings now in process of construction for their Government, which shows that there are nineteen buildings in course of erection, but still unfinished, which were put in hand, by the order authorising their construction, before the end of 1889. It is expected that, under the new system which has just been inaugurated, the public building-work will go on at a more rapid rate than this. Besides these nineteen lingering structures, the Government has fifty-nine buildings still immature, although varying in age, the cost of which, when completed, will amount to 18,439,154dol. The largest building now under way is the Chicago Post-Office, for which four million dollars have been appropriated; but the Washington Post-Office, which is to cost a little over three million dollars, is not far behind. The Mint at Philadelphia will cost two millions. The other buildings are comparatively small structures, costing half a million or less.

MEETINGS FOR THE ENSUING WEEK.

Saturday (to-morrow.)—Edinburgh Architectural Association. Visit to Museum of Science and Art. 3 p.m.

Monday.—Society of Arts. "The Thermo-Chemistry of the Bessemer Process," Cantor Lecture No. 3, by Professor W. N. Hartley, F.R.S. 8 p.m.

Tuesday.—Society of Arts. "English Art in Illuminated MSS.," by Sir E. Maunde Thompson, K.C.B. 8 p.m.
Institution of Civil Engineers. "Extraordinary Floods in Southern India," by E. W. Stoney. 8 p.m.
Auctioneers' Institute. "London Traffic Problems and their Solution," by Douglas Young, F.S.I. 8 p.m.

Wednesday.—Society of Arts. "Telegraphy Across Space," by Prof. Silvanus P. Thompson, F.R.S. 8 p.m.

Thursday.—Society of Arts. "The Earthquake in Assam," by H. Lattman-Johnson, I.C.S. 4.30 p.m.

THE ARCHITECTURAL ASSOCIATION.

APRIL 2nd, SPRING VISIT to new Public Baths, Pitfield-street, Shoreditch, Messrs. Spalding and Cross and Mr. H. T. Hare, Architects. Meet at works 2.30 p.m. A visit will afterwards be paid to the adjoining Free Public Library, Mr. H. T. Hare, Architect.
Nearest route by omnibus to Shoreditch Old Church, or by tram viâ Old-street, St. Luke's.

E. HOWLEY SIM } Hon. Secs.
G. B. CARVILL }

CHIPS.

A new water supply for Bonnybridge, near Falkirk, N.B., was formally inaugurated on Friday. The supply has been obtained from the Falkirk and Larbert Water Trustees, and the works have been carried out under the direction of Mr. W. W. Neilson, C.E.

The Lords Committee have sanctioned the proposals of the London, Brighton, and South-Coast Railway for making a fourth road into Victoria Station.

The Edinburgh Architectural Society met on Wednesday in last week, Mr. A. Lorne Campbell, the vice-president, in the chair, to hear a paper on "Church Decoration," by Mr. T. Kershaw Bonnar. Mr. Ramsay Traquair was intrusted with the criticism, which led to a discussion.

A fire which resulted in the total destruction of the Steam Joinery Works, near the Berw Bridge, Pontypridd, occurred on Friday night.

Mr. E. W. Code, of the Tiverton borough surveyor's office, has been appointed district engineer under the Ceylon Public Works Department, and has been the recipient of a testimonial from the town council.

The church of the Holy Nativity, Knowle, Bristol, has been enriched by the insertion of a stained-glass window in one of the lights of the north side, the subject treated being the Adoration of the Magi, and the presentation of their gifts of gold, frankincense, and myrrh.

The Admiralty estimated expenditure to the end of the current financial year—under the Naval Works Act of last session shows a total of £971,192, and among the largest individual items are £167,000 for inclosure and defence of Gibraltar Harbour, £145,000 for Gibraltar Dockyard extension, £185,000 and £81,000 for the dockyard extensions at Keyham and Hong Kong, and £40,000 for the Naval Cadets' College at Dartmouth.

LIST OF COMPETITIONS OPEN.

Godalming—Municipal Buildings (£6,000 limit)	£52 10s. merged	J. H. Norris, Borough Surveyor, Godalming	Mar. 26
Winchester—Public Baths	£25, £15	Walter Bailey, Town Clerk, Guildhall, Winchester	,, 31
Cricklade—Water-Supply Scheme	£21, £10 10s.	Harry Bevin, Clerk R.D.C., Union Offices, Wootton Bassett	April 30
Belper—Sewage Disposal Schemes	50 Guineas, 25 Guineas	Joseph Pym, Clerk, Belper	May 1
Tipton—Laying Out Park (£400 limit)	£25 (merged), £10	John W. Waring, Clerk, Public Offices, Tipton	,, 25
Trowbridge—Technical School (£5,500 limit—Mr. E. W. Mountford, F.R.I.B.A., Assessor)	£40 (and 5 per cent. com.), £30, £20	H. Ledbury, Sec., Castle-street, Trowbridge, Wilts	,, 28
East Ham—Public Offices, Library & Technical Institute, Fire-Engine Station, Public Baths, and Offices (cost about £55,000)	£105 (merged), £52 10.	C. E. Wilson, Clerk U.D.C., Public Offices, East Ham, E.	June 24
Formby—Sewerage of a Portion of the Township	£100, £50, £25	J. H. Havelock Sutton, Surveyor, Piercefield-road, Formby	July 1
Warrington—Police Station, Court House, &c.	£100, £50, £25	J. Lyon Whittle, Clerk, Town Hall, Warrington	,, 2
Stockholm—City Railway Stations and Junctions	£656, £438, £219	Consulate General, 27, Great Winchester-street, E.C.	Aug. 31
West Bangour, Linlithgowshire—Lunatic Asylum (limited to Scotch Architects)	£250, £200, £150, £100	A. Ferrier, Clerk, Parish Council Chambers, Castle-terr., Edinburgh	—

LIST OF TENDERS OPEN.

BUILDINGS.

Egremont—Police Station and Courtroom	Chester County Council	Reginald Potts, Clerk of the Peace, Chester	Mar. 26
Aberlour—Farm Steading at Orphanage		C. C. Doig, Architect, Elgin	,, 26
Lightcliffe—Stable and Coach-house		Raymond Berry, Architect, Arcade Chambers, Halifax	,, 26
Morley—Bakery, Mitchell-street	Industrial Co-operative Society	Geo. B. Clegg, Architect, 2, Peel-street, Morley	,, 26
Aughrim—Six Cottages		Edward Ellison, Rathdrum	,, 26
Markinch—Three Houses, Woodside		David Storrar, Architect, Cupar Fife	,, 26
Bedwelty—Vagrants' Wards	Guardians	J. A. Shepard, Clerk, Town Hall, The Circle, Tredegar	,, 26
Bradford—Rebuilding Unitarian Sunday School		Empsall and Clarkson, Architects, 7, Exchange, Bradford	,, 26
Llandrindrod Wells—Additions to the Bridge Hotel		M. Bruce Vaughan, F.R.I.B.A., Cardiff	,, 26
Aberfan—Pair of Houses	C. W. Jones	Wm. Dowdeswell, Architect, Treharris	,, 26
Lockwood—Offices, Showroom, and Erecting Shops, Prospect Ironworks		J. Berry, Architect, 9, Queen-street, Huddersfield	,, 26
Cupar Fife—Two Houses and Carrier's Office, West End		David Storrar, Architect, Cupar Fife	,, 26
Leeds—Premises, City-square	Standard Life Assurance Company	Archibald Neill, Architect, 18, Cookridge-street, Leeds	,, 26
Ballyboe—House		Philip M'Laughlin, 3, Kennedy-place, Londonderry	,, 26
Kirkby Lonsdale—Two Houses, New-road		John Kassell, Architect, Kirkby Lonsdale	,, 26
Coventry—Stabling and Dwelling-House, Abbot's-lane	Gas Committee	Geo. Winstanley, Engineer, Gasworks, Coventry	,, 26
Elgin—Residence, Duff-avenue		Charles C. Doig, Architect, Elgin	,, 26
Halifax—Boiler-House, Albert Mills		John Drake and Son, Architects, Winterbank, Queensbury	,, 26
Strichen—Alterations on Farm Steading at Auchrynie	J. Chalmers	Fred. Pirie, Architect, Cartlehaugh, N.B.	,, 26
Uppingham—House		Willink and Thicknesse, Architects, 14, Castle-street, Liverpool	,, 26
Castleford—Memorial U.M.F.C. Church, Whitwood Mere		Arthur Hartley, Architect, Carlton Chambers, Castleford	,, 26
Kingston-on-Thames—Alterations to Female Infirmary, and Underground Carriers, Steam Heating, &c., at Workhouse	Kingston Union Guardians	Jas. Edgell (Solicitor), Clerk, Union Offices, Kingston-on-Thames	,, 28
Thornhill—Dwelling-House at Edge Top		C. H. Marriott and Son, Architects, West Park-street, Dewsbury	,, 28
Bradford—Rebuilding Unitarian Sunday-School, Chapel-lane		Empsall and Clarkson, Architects, 7, Exchange, Bradford	,, 28
Halifax—Cemetery Chapel, Stoney Royd	Parka Committee	Edward R. S. Escott, C.E., Borough Engineer, Town Hall, Halifax	,, 28
Batley—Two Houses, Taylor-street		J. H. Brearley, Architect, Hanover-street, Batley	,, 28
Keighley—Eleven Houses in Ethel and Barley Streets		W. H. and A. Sugden, Architects, Cavendish-street, Keighley	,, 28
Gloucester—Cottage Homes, Tuffley Court Estate	Guardians of Gloucester Union	W. B. Wood, A.R.I.B.A., 12, Queen-street, Gloucester	,, 28
Holme—Additions to Curwen Woods		John F. Curwen, F.R.I.B.A., 26, Highgate, Kendal	,, 28
Holyhead—Alterations to Tabernacle Congregational Chapel, Newry-street		R. Roberts, 12, Newry-street, Holyhead	,, 28
Dunstable—Swimming-Bath at Ashton Grammar School		Frank Kelly, C.E., A.S.I., Architect, Albion-street, Dunstable	,, 28
Bromley, E.—Alterations and Additions at Asylum, Devons-rd.	Managers Bromley Sick Asylum	Robert Foskett, Clerk, Bromley, Middlesex, E.	,, 29
North Woolwich—Fire Brigade Station	London County Council	C. J. Stewart, Clerk, Spring-gardens, S.W.	,, 29
Halifax—Pair of Villas, Green Royd Estate		George Buckley and Son, Architects, Tower Chambers, Halifax	,, 29
Blackpool—Houses, Stables, and Workshops	Corporation	J. Wolstenholme, Borough Engineer, Market-street, Blackpool	,, 29
Grangemouth—Block of Houses, New-street	Grangemouth Building Society	J. P. M'Kenzie, Solicitor, Grangemouth	,, 29
Roath—Passenger Station	Great Western Railway Co.	G. K. Mills, Secretary, Paddington Station, London, W.	,, 29
Hollins—Warehouse	Lancashire and Yorkshire Ry. Co.	W. Bayley, Secretary, Hunt's Bank, Manchester	,, 29
Blackpool—Houses, Stables, and Workshop	Corporation	J. Wolstenholme, Borough Engineer, Blackpool	,, 29
Burley-in-Wharfedale—High School		Ed. C. Brooke, Architect, 6, Huddersfield-road, Brighouse	,, 30
Pocklington—Police Station	East Riding County Council	A. Beaumont, County Surveyor, Beverley	,, 30
Hull—Additions, Constable-street School	School Board	D. Jno. O'Donoghue, Clerk, Town Hall, Hull	,, 30
Leamington—Wing, Warneford Hospital		J. Warren, Secretary, Leamington	,, 30
Shirebrook, Mansfield—Four Shops and Dwelling Houses, &c.	Vickers and Atkinsou	R. F. Vallance, F.R.I.B.A., Archt., White Hart Chmbrs., Mansfield	,, 30
Ripponden—Five Houses	Co-operative Society	W. Clement Williams, Architect, 29, Southgate, Halifax	,, 30
Halifax—Wesleyan Chapel, Pellon-lane		Utley, Hebblethwaite, and Utley, Archts., Waterhouse-st., Halifax	,, 30
Ely—Alterations at Workhouse	Ely Union Guardians	C. B. Claxton, Clerk, Downham-lane, Ely	,, 30
Hammersmith—Extension of Electric Lighting Station	Hammersmith Vestry	W. P. Cockburn, Vestry Clerk, Town Hall, Hammersmith	,, 30
Auldearn—Church Restoration		John Robertson, Architect, Inverness	,, 30
Coventry—Cookery Kitchen, Spon-street Schools	School Board	George and Isaac Steane, Architects, 22, Little Park-st., Coventry	,, 30
Barkisland—Mill	B. Taylor and Co.	A. Clement Williams, Architect, 29, Southgate, Halifax	,, 30
Horton—Fifty-Eight Houses, St. Margaret's-road		A. Sharp, Architects, Albany Buildings, Bradford	,, 31
Penstone—Farmhouse	Rt. Hon. Sir T. D. Acland, Bart.	E. H. Harbottle, F.R.I.B.A., County Chambers, Exeter	,, 31
Skircoat—Villa, Albert Promenade		Chas. F. L. Horsfall & Son, Architects, Lord-st. Chambers, Halifax	,, 31
Bolton—Fever Hospital Extensions	Corporation	R. G. Hinnell, Town Clerk, Town Hall, Bolton	,, 31
Clayton—Two Through Houses, and House and Shop		Sam Spencer, Architect, 344, Great Horton-road, Bradford	,, 31
Thornbury—Store and Two Houses	Bradford Industrial Society, Ltd.	The Society's Offices, 65, Sunbridge-road, Bradford	,, 31
Marsden—Additions to Lingard's Wood Bottom Schools		John Kirk and Sons, Architects, Huddersfield	,, 31
Barmoor—Twelve Workmen's Houses	Blaydon Industrial Society	Wm. Allen, Architect, 16, Ryton Village	,, 31
Abercynon—Welsh Congregational Chapel		A. G. Evans, Architect, Pontypridd	,, 31
Wakefield—Alterations to Offices, Board-Room, &c.	West Rdg. of Yorkshire Rivers Bd.	Trevor Edwards, Clerk, Rivers Board Offices, Wakefield	,, 31
Thorverton—Six Cottages at Broadclyst		E. H. Harbottle, F.R.I.B.A., County Chambers, Exeter	,, 31
Morley—Tall Brick Chimney, Peel Mills	W. and E. Jackson	Buttery and Birds, Architects, Queen-street, Morley	,, 31
Bridlington Quay—Additions to Holy Trinity Church		J. V. Kingsley, Marshall-street, Bridlington Quay	,, 31
Skipton—Cottage Hospital at Skipton		C. A. Maidman, Architect, 13, South Charlotte-street, Edinburgh	,, 31
East Finchley—Mortuary Chapel at Cemetery	Vestry of St. Mary, Islington	W. F. Dewey, Vestry Clerk, Upper-street, Islington	,, 31
Clayton—Three Houses and Two Shops		Sam Spencer, Architect, 344, Great Horton-road, Bradford	,, 31
Killinchy, Ireland—Lecture Hall		Chas. A. Aickin, Architect, 20, Rosemary-street, Belfast	,, 31
Carlisle—Fire-Brigade Station	Corporation	H. C. Marks, A.M.I.C.E., City Engineer, 36, Fisher-street, Carlisle	,, 31
Thorverton—Two Cottages at Rudway		E. H. Harbottle, F.R.I.B.A., County Chambers, Exeter	,, 31
Llanfihangel—Additions to Board School		D. J. Lougher, Architect, Pontypool	April 1
Ushaw Moor—Thirty-Five Houses	North-Eastern Dwellings Co., Ltd.	R. Lofthouse and Sons, Architects, 62, Albert-road, Middlesbrough	,, 1
Old Windsor—New Infirmary Buildings, &c., at Workhouse	Guardians	Philip Lovegrove, Clerk, 32, Park-street, Windsor	,, 2
Lancaster—Rebuilding Nag's Head Hotel and Three Shops	Wm. Bell	J. Parkinson, Architect, 67, Church-street, Lancaster	,, 2
Ballybrown—Additions to R.C. Church	Rev. R. Kirby, P.P.	W. E. Corbett, Architect, 8, Glentworth-street, Limerick	,, 2
Bradford—Store Shed and Workmen's Cabin, Hammerton-street Destructor Works	Corporation	George McGuire, Town Clerk, Bradford	,, 4
Leyton—Extension of Electricity Station	Urban District Council	R. Vincent, Clerk, Town Hall, Leyton	,, 4
Clacton-on-Sea—Passmore Edwards Holiday Home for Children		Charles Bell, F.R.I.B.A., Architect, 3, Salter's Hall-court, E.C.	,, 4
Barry—Additions, Romilly Board Schools	School Board	W. H. Lewis, Clerk, Barry	,, 4
Halifax—Rebuilding White Horse Inn, Southgate	Samuel Webster and Sons	Jackson and Fox, Architects, 22, George-street, Halifax	,, 4
Llangollen—Head Master's House, County School		H. Teather, Architect, Andrew's Buildings, Queen-street, Cardiff	,, 4
Ardrossan—School	School Board	Jas. Cook, Clerk, Ardrossan, N.B.	,, 4
Daventry—Six Cottages, Warwick-street	Co-operative Society	R. York, Secretary, High-street, Daventry	,, 4
Bedwelty—Argoel School	School Board	C. Dauncey, Clerk, Tredegar	,, 4
Fordinbridge—Nursing Home		Fred. Bath, F.R.I.B.A., Crown Chambers, Salisbury	,, 5
Droitwich—Gasworks Buildings and Plant	Corporation	S. John Tombs, Town Clerk, Town Hall, Droitwich	,, 5
Sleaford—Foundation Works for Asylum at Ranceby	Kesteven County Council	Thos. H. Holdich, Clerk to Committee of Visitors, Sleaford	,, 5
Lancaster—Rebuilding Liverpool Bank		John F. Curwen, F.R.I.B.A., 26, Highgate, Kendal	,, 5
Bishop Auckland—Cottage Hospital	Urban District Council	Dr. McCullagh, Bishop Auckland	,, 5
Newton-le-Willows—Lock-Up Station	Joint Committee	J. S. Story, County Surveyor, St. Mary's Gate, Derby	,, 6
Morecambe—Two Houses and House and Shop		John Knipe's, Boulton-square, Morecambe	,, 6
Aldershot—Isolation Hospital	Urban District Council	W. E. Foster, Clerk, Aldershot	,, 6
Llanbadarn, Fawr—Restoration of Roof of Church Tower		W. A. Miller, Cambrian-street, Aberystwith	,, 6

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2256.
FRIDAY, APRIL 1, 1898.

SAFETY OF STAGING.

THE terrible crane disaster at Edinburgh we briefly mentioned last week will draw attention to the strength and rigidity of these structures in a gale of wind. It is not often we have to record accidents of this kind. The three-legged timber structures upon which cranes are put are usually well built of squared timber, and braced at certain stages, and are of not so great a height from the platform as to appear to give any ground for alarm as to their being overturned or blown down. The platform may offer some surface to the wind; but as this is horizontal, little danger from such a cause is apprehended. The ill-fated Edinburgh scaffolding was erected at the Waverley Station in connection with the new North British Railway Company's hotel at this station. The scaffolding, which was 62ft. in height, was erected on a part of the building in progress, which was then four stories high. While a large steam crane was being fitted up on the platform, and a part of it was being raised, the wooden structure, without warning, collapsed during a fierce gust of wind from the south-west. The men working on the platform were precipitated upon the building below, and three were killed and thirteen injured. The legs of the scaffold rested, we are informed, on the fifth floor of the new building, on the level of the North Bridge.

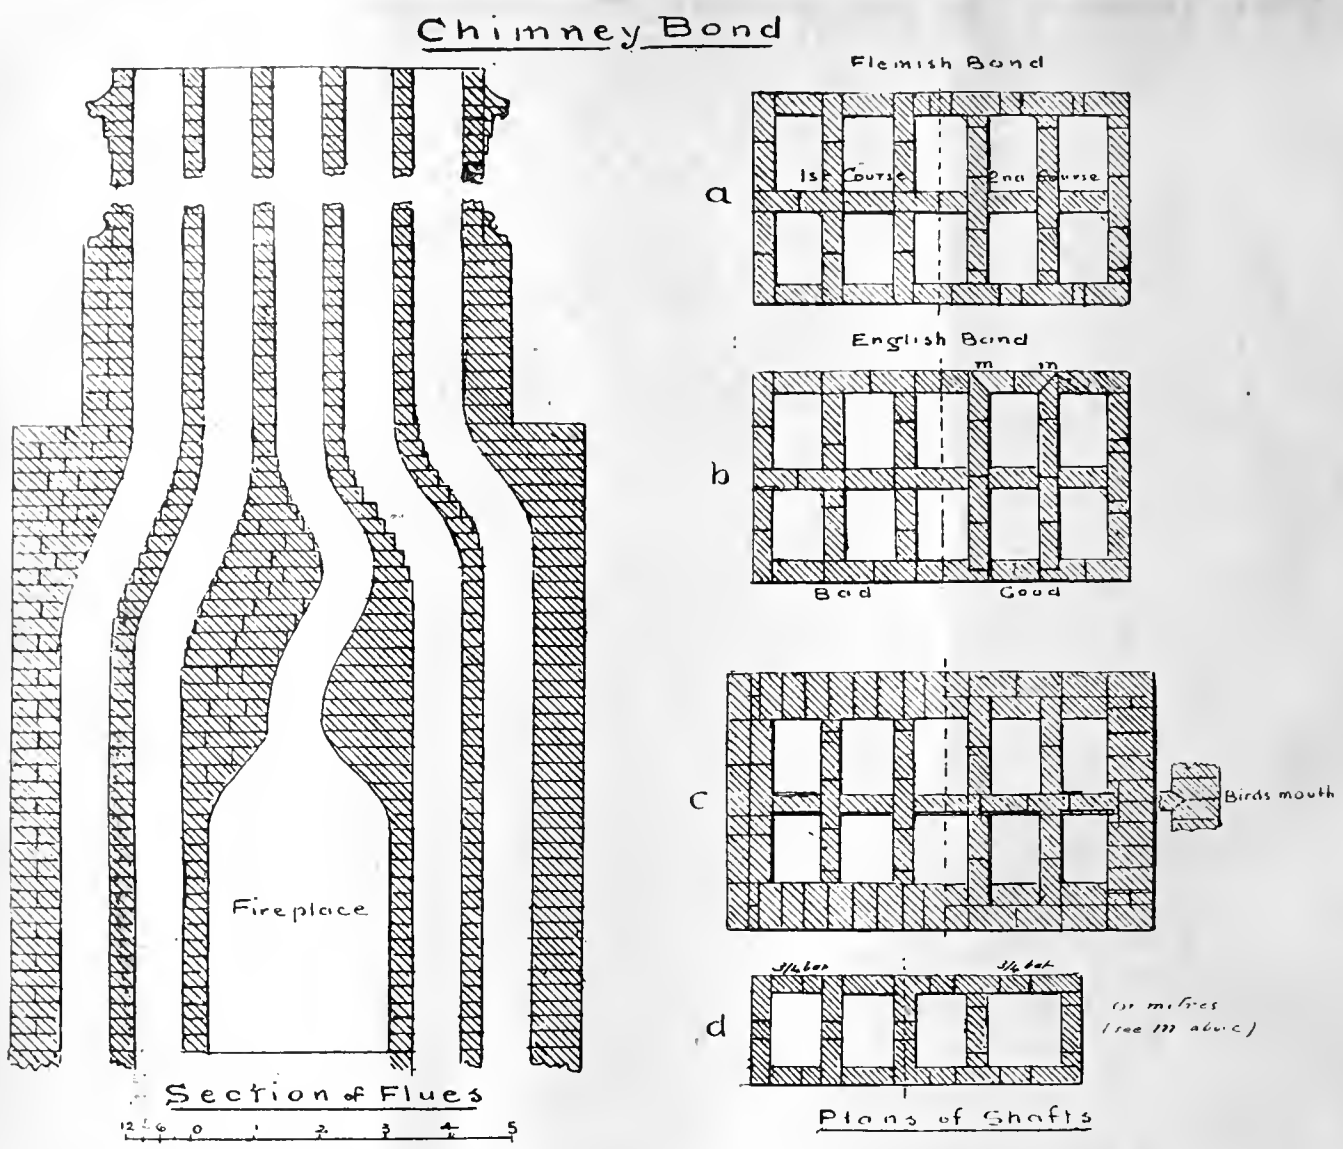
From the evidence and facts which are to hand, it would be impossible to come to any conclusion as to the exact cause of the fall. The wind, of course, exercised a very powerful overturning force, which must have strained seriously the support, or supports, on the leeward side of the structure, and we may practically say the moment of the force of the wind, which is computed to have been blowing with a velocity of 50 miles an hour, must be measured by the height of the staging—a considerable leverage. The effect of this force would be to throw the weight of the staging and crane on those supports or legs of the structure which were on the side opposite to the direction of the wind, and to intensify the pressure on them. The timber balks composing these legs of the structure would consequently be severely stressed, and any weak bracing would be taxed to a great extent. According to one witness, when the gust of wind came he saw the scaffolding bend bodily, and then there was a loud crash, and the mass came down. Another witness says, the huge staging began to "screw round" towards the east before it fell to pieces. The structure moved as one mass off the plumb, and remained virtually intact until it reached an angle of about 45°, when it collapsed. The boiler, in which steam was up, was thrown on to the top of a great block of completed masonry, above the foundation of the staging. We do not know precisely how the foundations were formed, or on what the staging rested. These may have been faulty. But we are inclined to believe that, from the height of the scaffold and the number of stages or cross braces which were used, the screwing or twisting action described was caused by a weakness in the bracing. If the evidence of this twisting can be established, it would appear to support the theory that the lateral bracing was not equal to the duty of rigidly connecting the uprights or legs throughout their height. The structure, as usually the case, consisted of three piers arranged in a triangular shape, and connected by cross-bracing. It was built of stout timberwork, and rested on iron beams laid on the walls, and it is stated that the supports were raised on the top of the piers which had supported the earlier crane scaffold. The bases were firmly secured, it is stated, by means of chains, and on the platform ten tons of material had been laid down, so as to counterbalance the weight of the steam crane of like weight, and which had a lifting power of three tons. The jib at the time of the catastrophe was projecting outwards, and a man was engaged at the time in fastening the tie-rod which was to raise the beam. There was, therefore, a considerable top-load on the platform, including crane, boiler, and counterweight, and this might have had some effect in producing the twisting motion, and thereby in dislocating the braces and causing collapse. A correspondent sends us a sketch of the structure, from which we gather that the framed timbers were bolted together. It would have added much to the safety of the structure exposed to gales if it had been supported by oblique guys firmly anchored to the ground or buildings. The scantlings of the timber might have been sufficient for the greatest stress put upon them if these had been rigidly connected by the cross-braces. In the mean time, we await the inquiry with interest.

SOCIETY OF BRITISH ARTISTS.

A GREAT deal in this exhibition we may pass over as of little originality or merit. In the central gallery half a dozen large canvases occupy important positions, their merits being less apparent. Tom Robertson's large, hazy landscape painted in a grey key of colour, "The Valley of the Tay" (4), has a breadth and atmosphere that recommend it to the attention, and near it is a full-length portrait of a lady seated, rather flatly painted in the face, in a delicate heliotrope walking costume, that is not devoid of those qualities of character painting and harmony so often missed, by S. H. Sime. At the same end of gallery is a picturesque coast view well known to tourists of the north-eastern coast, "Robin Hood's Bay," by W. E. Tindall (10), and two or three other works by the same hand show a poetic realisation of landscape. But on this wall the most charmingly painted of the seascapes is Terrick Williams' "Morning: Whitby." Mr. Williams has scarcely dono anything better than this fleet of trawlers and fishing boats seen through a misty sunlight. The sun is piercing through a hazy atmosphere, and subtle gradation of colour and reflection appear, and we have, in fact, a delicate symphony of silver grey. "Evening Glow, Brixham" (150), and "A Summer Sea" (194) are other studies of light and atmosphere worthy of Clara Montalba. Fresh colour and skilful handling are seen in Alfred S. Edwards's Scotch coast scene, "Home from the Fishing" (21), a large wave is seen breaking as it tumbles in to the shore. Robert Morley is another felicitous painter; "The Falling Tide" (49) and his "Highlanders," a dog group (303), are excellent studies in their respective subjects. A few small pictures are hung over the fireplace. "Pets" (52), by T. Watt Café, is well composed. Two Italian girls under a portico, one feeding pigeons and the other holding a vase, are refined in drawing and brilliant in the colour. Arthur Meade's "Across the Common" (71) is a large landscape. The evening effect is happily rendered, and Montague Smyth has chosen a similar theme, a flock of sheep being led through a country road—a pleasing study of waning light. Painted with true sympathy is A. E. Borthwick's "Little Match Girl" (77)—a poor wan-faced child sitting in a dark recess, with a flickering light in her hand, offering her wares. A large landscape, "Herald of Spring" (85), by Frank Spenlove-Spenlove, deservos notice. The white blossom of the trees and landscape are handled with much freedom, and the management of the white masses of the bloom is successful. A spring landscape is not the easiest to paint, owing to the delicacy of the tints. Two clever figure subjects by J. Sanderson Wells relieve the tameness of this part of the exhibition. "Gaslight Study" (87), a lady seated, in a pale canary satin, is decidedly one of the best works of the kind; and his "Gleaning" (110) is a delightful piece of outdoor realism. The two stooping gleaners are drawn with simple grace, and there is a happy arrangement of line and colour in the sloping, golden-hued stubble-field, and the grouping of the figures, that reminds us of the work of that painter of French peasant life, Clausen. A restful evening effect is E. Borough Johnson's "At Close of Day" (101), in which the figure of a labourer carrying a scythe is appropriate. A clever, broadly-treated face is Mr. Graham Robertson's "The Jade Necklet" (101). At one corner of the room is a pleasing portrait study of two young girls, daughters of S. Lamas Dore, J.P. (121); the colour is delicate, and the chrysanthemum background pretty. The painter is G. Hillyard Swinstead, a promising painter in this branch of art. Of course, we have a few of the "pot-boiler" class, like "Teasing Rover," very large. The composition "Children of the Foam" (149), that occupies the centre place on the long wall, is decorative and allegorical. It represents two sea-nymphs on a rock in a rough, foamy sea feeding and caressing a flock of seagulls which hover round. The painter, A. D. McCormick, has conceived a design of originality and power, French in motive and colour; but the tone is cold, and the flesh tints marble-like. Two other large canvases may be mentioned—Greville Morris's landscape "The Fold" (135), a moonlight effect, and H. P. Hain Friswell's view "Dolgarrog, North Wales" (159). The hazy atmosphere is well realised. Magnitude counts for a good deal with some landscapists. Montague Smyth's "Eventide" is also a clever piece of reflected light and shadow, and the work of Haynes King, "Cinderella in Rustic Life" (140), of Wm. Strutt's "The First Sight of the Cross" (168), and of Robert Morley's "Ready" (174), are of interest, especially the last.

In the south-east gallery Hal Hurst has a portrait of Mrs. C. Thompson (181) seated, in a delicate white evening dress, and a little further J. W. T. Manuel—"Mlle. Lavallière"—shows a stylish full-length figure of a Parisian lady in a dull red walking costume, trimmed with grey fur. The high collar obscures the lower part of the face—very aggravating if it is not intended to be a caricature. The President, Sir Wyke Bayliss, sends two fine interiors in his wonted style, in which all the glory of marble and stained glass and sculpture is manifested: "Louvain Cathedral" (208) is a splendid piece of draughtsmanship and colour. In the next gallery, his interior of Milan Cathedral we have seen before. Here the painter has full scope for his imagery and poetic fervour, and this pseudo-Gothic fane in all its splendour of sculptured pillars and colour is fully realised. C. E. Ritchie's study, "Black and White," a full-length portrait of a lady in black reading, on a white ground, relieved by delicate sprays and birds, has a French-Japanese motive.

R. Ponsonby Staple's "Leather Hunting" is a large, commonplace view of a cricket-field during a match. Arthur Briscoe, in "Rest" (260) has a pleasing study of a reposing girl in an orchard, graceful and vigorous, and there is freshness and atmosphere in Robert Goodman's large picture, "Drear October" (289), and in Percy R. Croft's "Along the Quay." Beyond these there is little to notice.



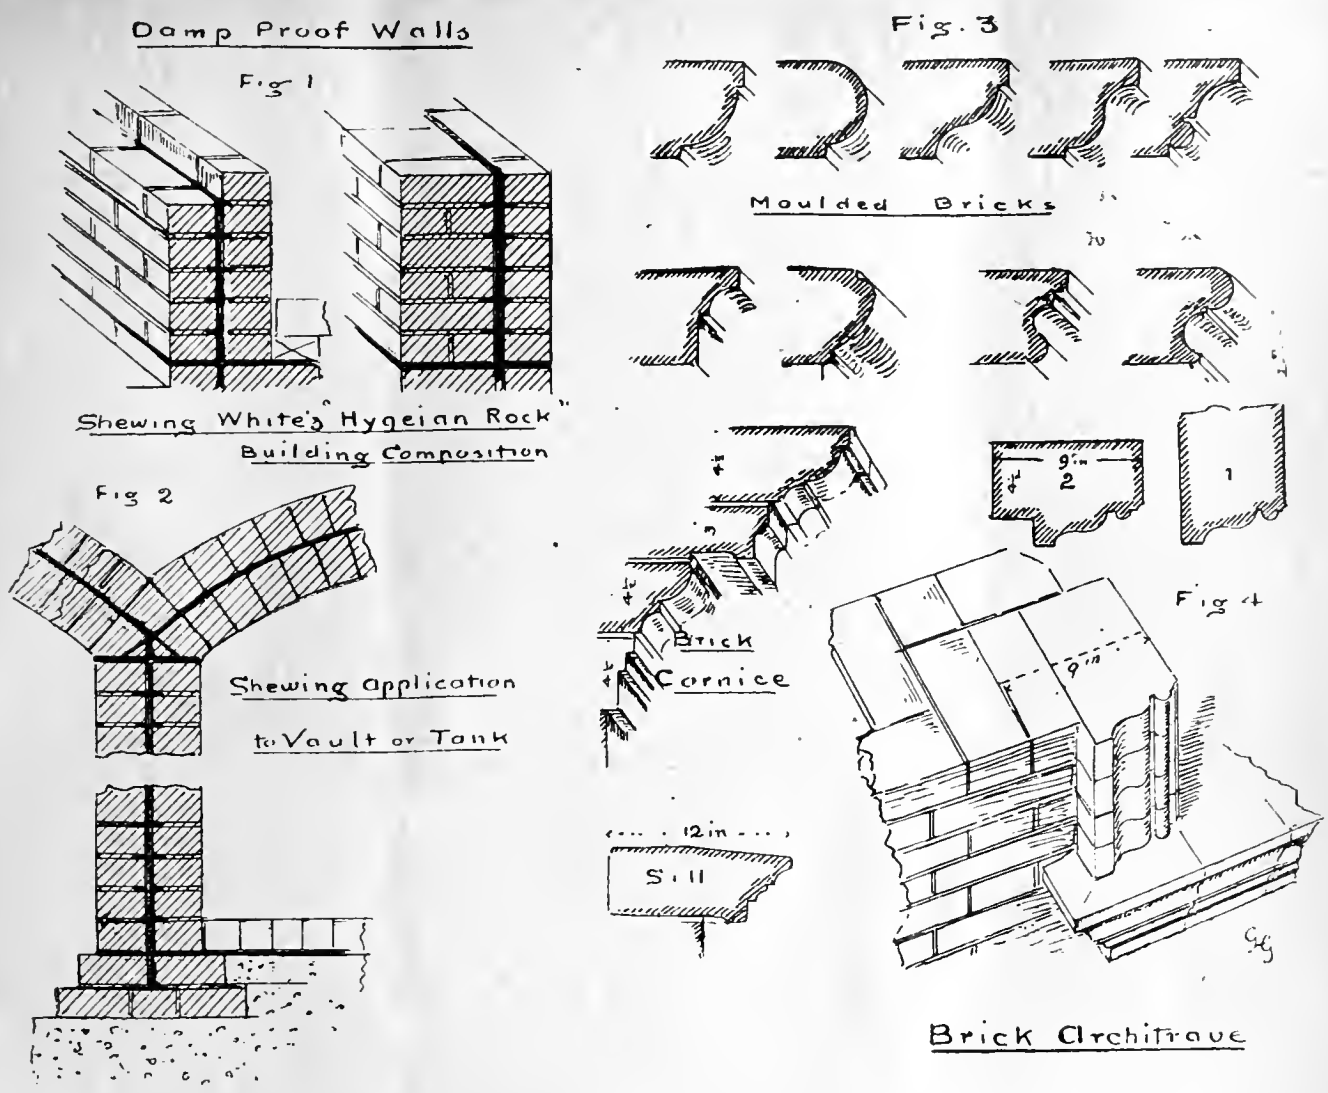
Several clever drawings and sketches in water-colour are to be seen in the North-West and N.E. Galleries. Leopold Rivers' work is always good; his "Moonlight," with its gleaming river (313), is pleasing. James Tower's "Calm Eveuing" (312) and Robert Horner's solid work (318) may be mentioned, also "Eventide," by F. Spenlove-Spenlove (323). Dora Woodhouse sends a nice drawing of the "Interior of St. Bartholo mew's" (328), and Miss Clara Taylor another view. Minnie Brown has a broadly-treated figure subject, "Evening"—a girl carrying a bundle of wood—admirable as a study of real life and landscape; and Geo. C. Haité has a bright study of "Farmlands" (354), and a brilliant sketch of a "Market Place" (357), both broadly handled. Two drawings, picturesquely treated, are sent by W. Harding Smith, "The Cobb Gate, Lyme Regis" (333) and "The Council Chamber in the Rath-Haus, Goslar" (403), showing some Late Gothic panel-work. Percy Dixon has a powerful picture, "Among the Tumbled Fragments of the Hills" (356). A clever piece of impressionism after Melville is Hans Hansen's "Scarboro' Regatta Day," a view of a throng of sightseers on the Pavilion. Cecil Aldin's "An Elopement," a pair tearing away in galloping speed in a carriage and four over a rough tract of country covered with snow, is vigorous. The drawing and movement of the belaboured horses are clever; and there are a few nice sketches on the screen by W. Tatton Winter (470), Janet Boothroyd (476), R. Ponsonby Staples (482), Harry P. Clifford (483), Harry Goodwin (49), John M. Bromley (507), H. Sylvester Stannard (518), and two symbolical subjects by R. Machell rather too ambitious. The chalk drawings in the vestibule by J. W. T. Manuel, O. Eckhardt, and Sidney H. Sime are clever from a comic or music-hall point of view. We have here the realism of the stage and the music-hall. The work of Sidney H. Sime is often vivacious, as that of Manuel is eccentric. Many of the sketches are burlesques. "The Unacceptable Sacrifice'" (544), "A Foul," "Nude" (549), "Pianoforte Recital," "Au Café" (554), "A Shadowy Dance," "Sloane Street," "A Wicked World," "At the Casino," "Chanteuse Eccentrique" (593), "Confetti et Serpentins," are clever but eccentric.

MODEL SPECIFICATIONS.—VI.

BRICKWORK—(*continued*).

THE construction of chimneys is an important branch of the bricklayer's craft, though it is often inadequately described. It is needless to say the footings should be formed of a sufficient number of courses, and be built upon a bed of concrete, so as to distribute the weight of the breasts. When the building is of several stories, the weight of the chimney-breasts and stacks are considerable, and would tend to subside or drag down the wall if a good spreading foundation was not provided. The "throat" of chimney, or the lower end of the flue, should be small and well "gathered over," each brick projecting about 1⅛in. beyond the course below, and the narrowest part of throat should be over the centre of fireplace. Flues are generally made 9in. by 14in., though for small grates 9in. square is sufficient. For kitchens of large houses, a flue 14in. square is usually built. In our section we show the arrangement of the flues of an ordinary town house, five flues being shown. Care is necessary in avoiding any sharp angle; but the flue should change its direction. A straight flue would be always smoking, and letting the rain and snow down. We show this necessary bend by the curved centre flue, which is supposed to be from the fireplace in the top story. The London Building Act (section 64) states: "Chimneys and flues having proper soot-doors of not less than 40sq.in. may be constructed at any angle; but in no other case shall any flue be inclined at a less angle than 45° to the horizon, and every angle shall be properly rounded." This is an important rule, and should be mentioned in the specification. The "withes" of chimney should be carefully executed, and be air-tight to prevent one flue destroying the draught of the adjacent one. It is impossible to make good bond; the use of bats cannot be avoided. But the specification should insist that they are to be well built, of well burnt bricks and the joints broken, and the withes should be well plastered or pargetted with a superior mortar.

Pasley, an authority on brickwork, recommends the bonds of chimneys to be executed with cement or with the best description of mortar mixed with tile dust, that "withes" should be plastered with it instead of common "pargetting" of lime and cow's dung. Coal ashes in the mortar are recommended. Fireplaces should be proportioned or built with reference to the bond or to the size of grate. In apartments



the fireplace may be four bricks or 3ft. wide, the jambs one and a half brick deep; in height the same, 3ft., not less. The depth is never less than 13½in. or one and a half brick, nor greater than two bricks. We show different kinds of chimneys in plans *a*, *b*, *c*, and *d*, in English and Flemish bond, and where the "closers" and half-headers come. In the bend (see *b*) mitred bricks as at *m m* may be used, or the bricks between flues let into the stretchers as shown. One brick external wall ought to be used as shewn at *c*. In the single shaft plan *d* the 14in. square flue takes the kitchen fireplace.

On a previous page (369) we gave a few sections of hollow walls. We now supplement them by the method already noticed of building two brick casings with 1in. or 2in. cavity, into which is run a specially-prepared liquid composition (White's "Hygeian Rock" building composition), which can be poured into the cavity as the work proceeds, every three or four courses. The sections show a 9in. and a 14in. brick wall, with the composition filling up the cavity, extending from the damp-course, and also entering into the joints on each side, which are raked out as the wall is carried up (as shown in Fig. 1). The same vertical damp-lining forms also a valuable flitch-like plate increasing the rigidity of the wall, dispensing with the need of iron ties, and adding considerably, as we can testify by experiments at Islington some years ago, to the strength of a 9in. wall. Two half-brick casings, with the cavity filled in, was supported like a beam upon supports, illustrating the great adhesive strength of the "Hygeian Rock" composition. In Fig. 2 we show how a series of vaults or a storage tank may be protected by a horizontal layer beneath the brick floor on concrete, and the vertical lining taken round the arch between the two rings of brickwerk.

33. *Chimneys and Flues.*—Turn rough brick segmental arches over all chimney openings; properly contract openings, and form throats to flues. Properly bond the withes of flues, and parget and core the same. Build the chimney-stacks in cement mortar as shown in drawings, with weathered capping and courses. Or—

The chimneys to be built as shown on plan and elevations. Carry up a separate flue to each fireplace, with easy bends. Gather the throats over openings quickly, and form the pockets as shown. No flue to be inclined at a less angle than 45° to the horizon, and the angles to be well rounded. Parget the flues with cow-dung mortar composed of 1 part cow-dung to 4 parts of hair mortar, and properly core. The flues to be 14in. by 9in. (or 9in. by 9in.) All flues at a less angle than 45° to have soot-doors and frames for sweeping. Or—

Carry up separate flues to the fireplaces with easy bends, and parget and core the same. Gather the throats over openings as shown. All flues inclined at a less angle than 45° with the horizon to have soot-doors for cleaning, and well round all bends. The external brickwork round the stack of flues to be 9in. thick. The "withes" are to be built with care, bonded to outer walls or to break joint (or the flues, instead of being pargetted, to be lined with fireclay flue-pipes of cylindrical or oblong shape, 9in. or 12in. in diameter), of Doulton's manufacture.

34. *Shafts.*—Build the shafts above roof in English or Flemish bond in cement mortar, as shown in drawings, finished with a neat weather joint. The tops to be finished with projecting courses (or with cornice-moulded bricks), and provide and fix to each flue a terracotta pot p.c.—, bedded and flaunched round in cement. Cement fillet to be run round top of sailing course. The plinth to have moulded bricks as shown set in cement above the given work.

When the chimney-stacks diminish externally, insert a clause to describe this, or, preferably, give a detail. At the various offsets the bricks are "tumbled in," or terra-cotta or stone blocks are inserted, weathered or moulded. Sometimes the shafts are enriched by panels, or by arches and pilasters in brick, in which case mention the particular moulded brick, if square or angular in section. Ornamental pilasters should be shown in detail or sketch, and show the bond. We shall give sketches next week.

The London Building Act provides certain rules as to chimneys (Sec. 64), in addition to the rule as to the angle of flues we have mentioned. The section states: "Chimneys built on corbels of brick, stone, or other incombustible materials, may be erected if the work so corbelled out do not project from the wall more than the thickness of the wall (measured immediately below the corbel); but all other chimneys shall be built on solid foundations, and with footings similar to the footings of the wall against which they are built, unless they are carried upon iron girders with direct bearings upon party, external, or cross walls, to the satisfaction of the district surveyor." Another sub-clause provides that an arch of brick or a bar of wrought iron of sufficient strength shall be built over the opening of every chimney to support the breast, and if the latter projects more than 4in. from the face of wall, and the jambs be of less width than 17½in., the abutments shall be tied in by an iron bar or bars of sufficient strength turned up and down at the ends, and built into the jambs at least 8½in. on each side. Other sub-clauses state: The flues of oven furnaces, cockle steamboiler, or close fire used for trade, or for cooking apparatus of any hotel, &c., are to have brickwork at least 8½in. thick, The inside of every flue, and also the outside, when passing through any floor or roof, or near any woodwork, is to be rendered,

pargeted, or the flue lined, with fire-resisting stoneware piping. The jambs of every fireplace opening are to be at least 8½in. wide on each side, and the breast of every chimney, and the brickwork of every smoke-flue, shall be at least 4in. in thickness. The back of every fireplace in a party-wall, from hearth to 12in. above the mantel, is to be at least 8½in. thick, and the thickness of the upper side of every flue at an angle of less than 45° is to be at least 8½in. It is also provided that the highest six courses of every chimney-stack shall be built in cement. Several other subclauses relating to building shafts, and their height above roof flat or gutter, cutting into chimney-breasts, timber and woodwork near flues and chimney openings, are given in this section. One of them states that the brickwork of any shaft is not to be built higher above the flat, or roof, or gutter than six times the least width of shaft.

ORNAMENTAL BRICKWORK.

The clauses we have already given are those which may be used in specifications of plain buildings; but the architect is often required to specify for particular kinds of brickwork of a more architectural character, ornamental gables, dormers, chimney-stacks, bay windows, cupolas, and window and door dressings, &c., come under this head. In other instances, terracotta or stone in their various forms are combined with the brickwork. Half-timber work, brick and flint, and other varieties of building are also to be considered, and it will be necessary to give a few clauses of a general kind that will apply to these descriptions of work.

We give now a few patterns of the moulded bricks usually made, and the manner the jambs or reveals of windows and doorways are worked. It will be seen that these bricks admit of a variety of combinations for cornices, string-courses, architraves, jambs, &c., which the architect may select and specify, and these arrangements ought to be sketched in the margin. We show a sketch of an architrave for a window, Fig. 4, and the two special bricks required to form the bond; also for a brick cornice and window-sill. Other sketches of ornamental brickwork, to illustrate cases which occur in practice, we shall give in our next article.

A general clause ought to appear providing that any moulded bricks or gauged work are to be made or executed from the architect's designs, and the bricks trimmed or touched up before burning. Moulded bricks should be made a trifle thicker than common bricks, to allow for rubbing and the finishing of joints. Before the scaffolding is struck, the work ought to be rubbed or rasped, and the arrises made straight and true.

1. *External Facings.*—The external walls to be faced with approved picked bright stock facing bricks (or Suffolk white, or red Fareham) carried up with a flat ruled joint in washed sand and lime or slightly coloured (or tuck-pointed in fine stuff). No headers to be broken. Or—

Face the walls and chimney-stacks with the best red facing bricks (or Lawrence's, or picked stock facing bricks, or pressed facings) laid in English (or Flemish) bond finished with a neatly-struck weather joint as the work proceeds. The moulded brick courses to be all headers, to match the facing bricks in cement, and rake out joints and point to match the facings. All arches to be of the best rubbers, rubbed and gauged and set in cement. Or—

Face the external walls and the other ornamental portions shown on elevation with approved selected Suffolk (or red Fareham or bright stock) bricks, and point the work as it proceeds with a weather-joint in washed sand and lime or slightly coloured with ochre. Or—

Rake out joints and tuck-point in fine stuff when striking scaffold (or with blue ash-mortar and flat joint). All chimney-stacks should be pointed with a weather-joint in cement, after raking out the mortar joints.

2. *Dressings.* — All window and door dressings, plinths, eaves, and other courses to be formed as shown in detail with red Fareham (or washed malms or moulded bricks). Or—

The pilasters, window and door reveals, and quoins to be executed as shown in detail, with cut and rubbed red-brick or other approved rubbers set in fine putty (or with moulded bricks as shown). Or—

All string-courses, sills, jamb mouldings, cornices, and other projecting members to be executed, as shown, in red Fareham (or other approved) rubbers in fine putty, the weathered courses being in cement.

THE SOCIETY OF ARCHITECTS.

THE fifth monthly meeting of the Society of Architects was held at St. James's Hall, Piccadilly, W., on Thursday evening in last week, the president, Mr. T. Walter L. Emden, J.P., L.C.C., in the chair.

OWNERS OF PROPERTY AND RIGHTS TO LIGHT.

Mr. A. A. Hudson, A.S.I., Barrister at Law, read the following short paper on this subject, entitled: "The Position of Owners of Property with Regard to Rights of Light and Other Easements, with a Suggestion for Future Legislation." He proposed, he said, to deal with the subject, as far as possible, from a layman's point of view, and to avoid legal terms. The question to be faced, continued the lecturer, is whether anything can be done to remedy the existing state of law, and obviate the great difficulties which are placed in the way of, or I might say added to, building operations, by the tactics of persons claiming rights of light. Those tactics are known, I am sure, to everyone in this room, and therefore it would serve no purpose to enlarge on them. Of course, there are two sides to every question, and the person whose light is to be affected has a right to protection. Now, in order to consider the possibility and advisability of legislation, it is as well to consider analogous legislation in the case of party-walls. Before the London Building Act, and previous Acts dealing with party-walls, there was constant litigation. The owner of the property upon which buildings were proposed to be erected, or rather reconstructed, often did not know whether the dividing wall was a party-wall; and even if he knew that, he did not know what kind of party-wall it was. A party-wall may mean, first, a wall of which the two adjoining owners are tenants in common; secondly, the term may be used to signify a wall divided longitudinally into two strips, one belonging to each of the neighbouring owners; and, thirdly, the term may designate a wall divided longitudinally into two moieties, each moiety being subject to a cross easement in favour of the owner of the other moiety. In case of a longitudinal division between two neighbours, each of them could pass away one moiety; and if this was done, the moiety of the other owner might be of little use to him. Many other peculiarities and difficulties arose—more useful to the lawyer than to anyone else. All this doubt has been disposed of by the London Building Act, which constitutes every division wall a party structure with certain definite rights, and in case of any dispute the parties can refer to the arbitration of a technical tribunal. The objection raised to legislation in matters of this kind always is that private rights should not be taken away by Act of Parliament, unless there is a very strong case for so doing. Undoubtedly the London Building Act does take away private rights, but so do many other Acts. The Lands Clauses Acts compel a person to sell his property or his rights in it, and legislation of this kind is permitted because in the public interest it would have been disastrous to prevent great public enterprises being carried out either at all, or at such great expense, by paying out blackmailers, as to render the enterprise a failure. In the case of party-walls, the rights as between private owners have been legislated for, and this offers a stronger case of legislation than in the case of great public enterprises like railways, canals, and so on, where legislation has been, so to speak, between private owners and the general public. It must be remembered also that in the case of party-walls under the London Building Act, nothing in the Act authorises any interference with an easement of light or other easements, and this would include a right to support. But the powers conferred by the Act of dealing with party-walls in all kinds of ways are so wide, that this reservation interferes but slightly with the useful operation of the Act. The person building must so deal with the party-wall that the adjoining owner's easements are not interfered with; but directly either a building or adjoining owner proceeds in any way to use the powers of the Act, he brings himself under its powers and loses the rights which he had at common law. The question is, in what way building in London could be simplified as regards rights of light by some such legislation as the London Building Act in relation to party-walls. I think the first principle to be adopted is that disputes should be settled by a technical tribunal, and I think that the tribunal should be presided over or be assisted by a lawyer. The reason I suggest that a lawyer should be added is because the rights of neighbouring owners are much more complicated than in the case of party-walls. The reason for a technical tribunal is obvious: instead of the disputants having to prepare elaborate models, and to call in conflicting evidence of the facts, the parties would come before a tribunal composed of persons who understood plans, and who could, and should, view the site and surrounding buildings. In the next place, the persons proposing to build should serve notice on the adjoining owners, and the meaning of the term "adjoining owners" would have to be defined so as to include occupants, trustees, reversionees, tenants, and all persons who might claim right of light. The notice, I think, should specify exactly what kind of building is proposed to be erected, and that the plans, sections, and elevations can be seen at the offices of the tribunal to be created to dispose of such cases. The parties on whom such notices are served should be called upon within a certain time to specify their objections (if any) to the proposed building. The building owner would then know the persons from whom he must expect opposition and claims. It would be difficult to take away an adjoining owner's rights to compensation for injury to light upon a failure to answer such a notice, and it would not even be possible, I think, to settle the amount of compensation to be paid in any case before the buildings were erected. But the object to be attained would be to get settled at once by a competent tribunal, whether upon the plans deposited the building owner should or should not be restrained by injunction; and I would suggest that no person who had been served with the notice, and had failed to object at the time to the proposed building, should be entitled subsequently to apply to have the building pulled down. If on the application of objecting parties an injunction was granted by the Court, of course, the building owner would have to make fresh plans; if no injunction was granted, then he would be free to build; but, on completion, he would be obliged to meet any claims made against him for injury to light or air. The distinction between an injury which will entitle an adjoining owner to an injunction, and an injury which would only entitle him to damages, has been more or less defined by many judicial decisions; but the principle of those decisions might be codified so as to strengthen and direct the tribunal, who in the first case have to decide whether an injunction should be granted or not. This tribunal should, I think, be able to decide this preliminary question without a jury; but when the building was erected, unless the partners had in the meantime agreed, I think a claimant should be entitled to a jury if he wished it, the tribunal, of course, being the same. I do not think it necessary that the tribunal should only have to deal with matters of right to light. There are a great many disputes about building, engineering, and other technical matters which may well be disposed of by a similar court. One of the most important matters in view of legislation is to provide some remedy for the enormous costs which a litigant may be put to now without any means of preventing it. There are, as most of you know, two scales of costs, one between party and party, and these are all a successful plaintiff or defendant can recover; and another scale called solicitor and client costs, and it is the difference between these two which a successful defendant or plaintiff has to pay. In the cases in which expert evidence, models, and so on are required, this difference is very great. Eminent judges have already expressed an adverse opinion on these two scales of costs, but in the case of a technical tribunal being created to settle and dispose of the matters I have indicated, the tribunal should have power to regulate the scales of costs as well as the procedure, subject to the approval of the Lord Chancellor. This was so provided in the case of the Tribunal of Appeal under the London Building Act. I think this tribunal affords an illustration of the advantage to litigants of having their cases disposed of by men with a practical knowledge of the

subject. I do not say this because I am a member of that tribunal, but because persons have found out how promptly their claims are disposed and how short the trial is, this being due partly to the fact that the tribunal always views the site or buildings as the case may be. With a similar tribunal light and air cases might, I think, be disposed of equally well. I have now concluded my subject. I have purposely made it suggestive. The suggestions are simple, and I have stated the points for consideration shortly, so that in the discussion which I hope may issue the experience of members will bring into more prominence those matters which are of importance to surveyors and building owners.

Mr. G. Gard Pye, in proposing a vote of thanks to Mr. Hudson, said information of great value to architects had been given, especially to those practising in London, where questions of light and air often arose. With regard to party-walls, he did not quite follow the author's definition of a party-wall, and stated a case in which he could not be quite certain whether the structure could be reckoned as a party-wall or not. He proposed the following resolution:—"That a Parliamentary Committee be appointed to inquire into the present state of the law with regard to ancient lights and other easements, with a view of saving the large amount of moneys now expended in determining and settling the rights of owners with regard to the same."

Mr. J. R. Manning seconded the vote of thanks, remarking that the question of ancient lights had for a long time been one most difficult to decide, men's ideas as to the value of light being so various. Such a tribunal of qualified men as that suggested by Mr. Hudson to deal with questions of light and air would be of the greatest service to the profession. As an example of the various values set on light, he mentioned the cases of two dentists. One of these, by the erection of an adjoining building, had the light of his operating room a good deal affected, but did not, however, take any action. In the other case, the second dentist raised a question about a shadow which was cast across his operating-room, and declared that he could not stay in the building any longer. His case was put into the hands of lawyers, and after a long trial it was decided in his favour, and 14in. had to be cut off the offending chimney by which the shadow was cast. The whole question of ancient lights was beset with difficulties, and he could not help remarking the almost fabulous value which some owners put upon their windows. He also wished to second the resolution proposed by Mr. Gard Pye, as well as the vote of thanks.

Mr. George Hubbard said there was one point in Mr. Hudson's paper which he did not quite understand. The lecturer had proposed that the tribunal should adjudicate upon the amount of compensation to be paid for loss of light after the building was erected. In the case of the speculative builder this would be very hard, as, after his building was erected, it was most likely that the speculative builder would have no money to meet any liabilities which might be claimed as compensation. He considered that the builder should know what claims he would have to settle before the building was erected.

Professor Banister Fletcher, in supporting the vote of thanks, said he had known and admired the lecturer for many years; but he thought a man could admire another, and yet not agree with him. He should like to point out the immense difference between party-walls and light-and-air questions, so that they might appreciate the distinction between the two. The case as mentioned by Mr. Hudson with regard to the London Building Act of 1894 was extremely good; but there was obviously a vast difference between party-walls and light and air. In the case of a party-wall, it was important that both sides should have it dealt with in the easiest and speediest manner possible; no right was lost by rapidly dealing with a party-wall, which should be rebuilt in the speediest manner possible. But in the case of light and air, the man who wished to build wanted to deprive a man of that which had been his from time immemorial, and which belonged to him as much as the house he occupied. The case of the two dentists which Mr. Manning had given them was rather amusing, and it appeared to him that Mr. Manning had either "done" one man, or that he had given way too much to the other. Referring to the value of windows, he alluded to a lecture given recently by Dr. Longstaffe, in which it was stated that the Hotel Windsor had rendered unfit for habitation some model dwellings of the artisan class by taking away their sunlight. He thought there was usually a great objection on the part of the architect against anyone stopping his building. He had been in the profession a great number of years and could, therefore, appreciate this great difficulty of the architect; but they ought to keep a judicial mind, and to remember that there was always the other side to be thought of. They must consider, too, how far the proposed tribunal would meet the difficulties. The London Building Act had certain intentions, and everybody thought the Act carried out these intentions; but it did not do so. Indeed, the lawyers regarded it as one of the worst-drawn-out measures existing in the Statute Book. Ground-rents had now advanced to such an enormous extent in value that in London every inch of space was valuable. There was no doubt, as Mr. Hudson had said, that the cost of litigations in questions of light and air was enormous; but it was not an unmitigated evil, for it made men timid of entering into such cases. He was aware of a large hotel, the proprietors of which had put aside a sum of £20,000 to fight any light-and-air cases which might be brought against them. The Court of Chancery was, in his opinion, a highly respected tribunal, with which he was very well satisfied, and he doubted whether they could constitute another tribunal, in which the public would feel an equal degree of confidence. He differed from Mr. Hudson's suggestion that rights of light could be simplified in London by some such provision as that which existed in regard to party-walls, because the two things were entirely dissimilar. Professor Robert Kerr once made a similar proposition, but it ended without result, and he believed any like suggestion to-day was also doomed to be inoperative. In his opinion, the Society of Architects was doing a great deal of good by ventilating such important subjects as those before it.

Mr. Henry Lovegrove said that the whole question was thoroughly gone into some years ago by a committee appointed by the Institute of Architects, and a careful report was drawn up; but it was found impossible to proceed with it, because there were so many lawyers in the House of Commons. He agreed with Mr. Hudson's views, and thought that with such a tribunal as suggested all would work very well, and would be a great improvement on the cumbersome system now in vogue. He was glad to hear Professor Fletcher say a word about the speculative builder. The speculative builder was a much-abused man, but he did not know what they would do without him.

Mr. Ellis Marsland, hon. secretary, thought that Mr. Hudson had foreshadowed some very welcome changes in the building laws of London, to gain which architects and surveyors, as well as lawyers, must be prepared to make some sacrifice Mr. Hudson had pointed out that he wanted all questions dealing with light and air to go before a technical tribunal, because he wished to avoid expense and delay. These same questions of light and air were also matters in which architects and surveyors often got into bad repute. In the cases which came before the Courts in the usual way, they would have three or four surveyors on the one side swearing that there was a great amount of damage, and they would have three or four surveyors on the opposite side swearing that there was no damage at all. Such instances as these gave the judges a very bad impression of their profession. Mr. Hudson's idea was that the members of the tribunal should go down to the site and inspect it for themselves, and they would then be able to form an opinion without taking conflicting technical evidence at all.

In closing the discussion, the President observed that, in his judgment, there was not such a vast difference between party-wall cases and cases of light and air as had been assumed by Mr. Fletcher, and he considered that Mr. Hudson's proposal was a good one. He had had some thirty years' experience in the architectural profession, and during that period he had necessarily had something to do with questions of light and air. He had noticed that where a public building was erected more claims for compensation were put forward than in the case of a private building. According to Mr. Hudson's proposal, the person about to build would first serve a notice on the adjoining owners, and if any of them thought they possessed a claim, they should within a certain period give notice of such claims to the tribunal. The tribunal would then settle whether or which of the adjoining owners' claims were legal and the amount of compensation to be awarded. Under the present system he had often known builders to be stopped for eighteen months or two years at a time, because some adjoining owner had brought an action for right of light against the building owner. This delay was often a serious matter, whereas by Mr. Hudson's proposal the matter was settled at once. Many people who had no legitimate right of light often put in claims, and these claims were generally a source of great expense and trouble. Mr. Hudson's proposal was a commonsense one, and should, therefore, appeal to everybody.

The vote of thanks and the resolution were then put and carried unanimously.

Mr. Hudson, in reply, said that Mr. Marsland had hit the right nail on the head. What he had suggested in his paper was that they should have a technical tribunal, but they might have more than one lawyer upon it, or a judge if they wished. In any case, the tribunal should have power to visit the site, and so avoid wasting time. In this way the adjoining owner, whom Professor Banister Fletcher wished to protect, would be protected by a cheaper tribunal. Professor Fletcher had said that the speaker was wrong in dealing with questions of light and air in the same way as party-wall cases were dealt with. He thought, however, that the two cases were very similar, as a party-wall might deprive an owner of his rights, just as much as a builder might deprive an adjoining owner of his rights of light; and it was of equal advantage that questions of light and air should be dealt with as speedily as possible. Professor Fletcher had said that there was no tribunal which had power to take away a man's rights except the Court of Chancery; but he would point out that the Lands Clauses Consolidation Act, though not a tribunal but a Statute of Parliament, did deprive a man of his rights. It had power to compel a man to give his land, if public enterprise demanded it, and awarded him a reasonable amount of compensation, and he thought it was right in every case that the minority should give way to the majority. Replying to Mr. Hubbard, he would point out that it would be very difficult to judge the amount of damage to a man's right of light until after the building was erected, and it was impossible to fix the amount of compensation till the damage had been determined. He agreed that it would be hard in the case of the speculative builder; but he did not see how it could be avoided. Every person had a right to build on his own land; but when his building interfered with the right of light of the adjoining owners they had a perfect right to compensation. He had read a paper on this subject at the Surveyors' Institution, and he noticed that the members looked rather blue at the idea of his tribunal, for they thought that the whole of the work of surveyors would be wiped out. What he proposed doing was, he thought magnanimous, as he would be wiping out an immense amount of litigation. He was rather disappointed that the discussion had followed the lines it had. He thought there would have been no question as to the necessity for his proposal, but that speakers would have made suggestions for its efficient carrying-out. It was certainly a great advantage for a man to go before such a tribunal and be told that either he had or had not a right of light. In any case, if they would cheapen the trial of light-and-air cases, they were conferring a benefit on both sides. What he had suggested was, that there was an opening for a new system of legislation—for a system of simplified legislation, and he left the matter, together with his proposal, in their hands.

THE ARCHITECTURAL ASSOCIATION.

The fortnightly meeting of the Architectural Association was held at 9, Conduit-street, W., on Friday evening, the President, Mr. Hampden W. Pratt, F.R.I.B.A., in the chair. Messrs. C. C. King and S. J. B. Stanton were elected as members. It was announced by the President that a demonstration on stained glass would be given before the members by Mr. Christopher Whale on Monday, April 4th, at the Central School of Arts and Crafts, Regent-street, W. Mr. E. Howley Sim, hon. secretary, stated that the annual Members' Soirée will take place at the Café Monico, Piccadilly, on Friday, April 29th. A vote of thanks was passed to

Mr. T. W. Dinwiddy for permitting the visit on the previous Saturday to the public baths in New Cross-road.

CONSTRUCTIONAL STEELWORK.

A paper on this subject, illustrated by numerous diagrams, was read by Mr. T. Cunnington, who observed that until recent years this topic was considered to be within the sphere of the civil engineer only; but with the developments both in character and in extent of recent buildings and requirements, it has to be seriously considered by the architect. In buildings of the warehouse or factory class, the construction is comparatively simple. The complication, both as regards loads and construction, arises where the several parts of the same building are occupied by several different classes of tenants and devoted to different uses. In city buildings, where space and light are of the most paramount importance, every thought and care has to be taken with the view to limiting the columns, stanchions, girders, and floors to the minimum sections consistent with their carrying power. In the first place we will consider

INTERIOR COLUMNS AND STANCHIONS

with their several connections and joints, as upon them depends principally the stability of the superstructure. Interior columns and stanchions form one of the most important steps in the modern problem of design, and greater variations are probably to be found in them than in any other features of steel construction. Each of the several forms has its own adherents, and the many types of connections between the columns and stanchions, and with the floor systems, permit of an unlimited choice. We will endeavour to investigate the more prominent forms, and point out the advantages and disadvantages of each. The most satisfactory for general and specific cases may then be selected as combining the desired features. The relative advantages of the various sections are of the greatest importance, as affecting economical and successful design. In actual practice the treatment of the different shapes will be found to vary greatly with the designer, not only in the relative value of the sections, but in the treatment of any one section. In the first place, the formulæ differ greatly—not in fundamental principles perhaps, but in the treatment being often empirical, and containing factors deduced from some special case. These formulæ, also, generally assume ideal loading, which seldom occurs in the actual building, and none, or very few, full-sized tests have ever been made on the effects of eccentric loading. The general principles which govern the

RESISTANCE OF BUILT COLUMNS

may be summed up as follows:—(1) The material should be disposed as far as possible from the neutral axis of the cross-section, thereby increasing resistance. (2) There should be no initial internal stress. (3) The individual portions of the column or stanchion should be mutually supporting, and (4) the individual portions of the column or stanchion should be so firmly secured to each other that no relative motion can take place, or they will fail as a whole. From experiments, we know a closed column or stanchion is stronger than any open one, due to the fact that the edges of the segments are mutually supporting when held in contact by complete closure. Therefore the circular-built column is undoubtedly the most favourable form for compression, because the capacity of columns of equal areas varies as the metal is removed fromthe neutral axis. It must also be remembered that any form of column or stanchion, having a maximum and minimum radius of gyration, is not economical for use under a single concentric load, as the calculations must be based on the minimum radius of gyration. The metal represented by the excess of the maximum radius of gyration is, of necessity, disregarded, and part of the section is thus lost or wasted when we consider the ideal efficiency of the column: but practice does not always support theory, and many other questions besides mere form arise in connection with the judicious choice of a section. The form of stanchions and columns most generally in use are No. 1 section, made of four angles, riveted back to back; No. 2, of two T-bars, also riveted back to back. The caps and bases of these are easily formed by either forging one of the flanges of each bar at right-angles to the stem, or riveting forged angle-seatings to the stem to receive cap- and base-plates. These stanchions are frequently made up of angle-bars and plates riveted together as indicated. The strength and size can be either increased or decreased as circumstances require. The caps, bases, and flange-plates of these forms are attached by angle cleats riveted to the plates, angles, and webs. Bearings for joists or girders at intermediate levels can be readily riveted either to the web or flanges of them. Another type is made up of four angle-bars, with strap-bars, say, every 4ft., or diagonal bracing suitable to the purpose, to be used either as stanchion or bracing. Other stanchions are made up of single joists, joists and angles, joists, tees, and plates, and joists with one riveted both sides of web. The strength of each of the sections can be adjusted either by increasing the size of the joists, or angles and tees, or by the addition of flange plates. The cap- and base-plates are attached to the shaft by riveting angle-cleats to the webs and flanges to form the requisite bearing surface for the flange-plates. Stanchions are often made up of channel sections and joists, or of channels, bars, tees, and plates. These forms of stanchions are applicable for continuing through two or more stories of the building admitting of two or four girder joists bearing at the same level. Other sections, again, are made up of flanged quadrant bars, flanged quadrant bars and channels; the diameter can be increased and decreased as occasion requires by using smaller or larger sections of channels. Certain of these sections, whilst retaining the minimum diameter, can be very considerably increased in strength by adding plain or bulb-shaped tees, plain bulb-shaped angles, or by the addition of plates, either inside or outside of the channel bars. Another form is made up of channels and Lindsay's special angles, or plain angles. This particular section was very successfully used in the West Australian Bank, Cornhill. Stanchions formed of channels and angles readily adapt themselves to purposes of construction of high buildings, where several floors have to be considered, and supported by the same stanchion. The section can easily be made to suit any number of loads and floors, by either increasing or decreasing the diameter, or increasing or decreasing the sectional area. These sections have found particular favour with the American architects and engineers in the construction of their high buildings, from the fact of their easy adaptability to their specific requirements, to their form and construction, and from the fact that they can be readily incased with fire-resisting materials independently of being made up of bars, that are either kept in stock at the mills or can be generally quickly supplied. Drawn steel columns are made from 4in. up to 24in. in diameter, and from ⅜in. to 1⅛in. metal in one piece, excepting the flanges forming caps and bases. They are made in lengths not exceeding 21ft. or 22ft., and are generally used in lengths not exceeding in height one high or two short stories; when they are superimposed, the single joist girders bear upon the flanges, and are attached. When columns of larger diameter are required, and girders either of double joist compound girders or riveted plate girders are used, the columns are made to seat on the girders, the girders abutting and being continuous, the flanges of the caps and bases being bolted to the girders. Ornamental caps and bases, either in cast iron or other metal, can be readily adapted to these drawn steel columns, to suit the several styles of architecture. The great advantage of these columns is that you get the greatest amount of carrying power for the minimum diameter and thickness of metal; this deserves consideration when space is an object, or where shipment has to be considered. One of these columns was tested at Messrs. Kirkcaldy's with most excellent results, the length being 14ft., 7in. diameter, and 1in. metal, the calculated safe load being 92 tons. It was tested up to 180 tons, practically without any movement, and no injury was observable under microscopical examination. Other forms of columns are built up of steel plates and the bars, and curved steel plates for large diameter columns, heavy constructions; or, where they are exposed, their form admits of being increased almost to any diameter and strength. The cap and base flange-plates are attached by angles riveted to shaft, and the flange-plates riveted to the angles. In special cases an additional plate is put on, the outside extending from 12in. to 14in. from the ends before putting the flanges on for purposes of additional strength. The steel stanchions shown on Wm. Lindsay and Co.'s sheets combine the principle of the ordinary angle-bar stanchion and the column, the bars being rolled in such a manner as to form a hollow shaft, and placing the metal at as great a distance from the central axis as possible. They are made of four bars, or, for additional strength or diameter, plates or bulb-bars are inserted between the flanges of the angles. The cap- and base-flanges are attached to forged bent plates, or angles riveted to shaft. These stanchions have been extensively used, as, independently of their strength, comparatively with their diameter and sectional area, independently of the fact of being easily incased in fire-resisting material, either rectangular or circular shape, to suit the architecture of the building. Taking a stanchion 14ft. long, 8in. diameter, the safe load is 80 tons, and generally, in practice, the full load has been placed upon them, and proved satisfactory. To increase the size of the bases and bearing-surface area of the various steel columns and stanchions referred to, to provide for heavy or extreme loads, they rest upon cast-iron bases, formed to suit each special requirement. The cast bases may either rest upon joist foundations, hereafter referred to, or upon adequate stone bases and concrete foundations, the columns and stanchion bases being bolted down to the cast-iron bases.

THE FIREPROOFING OF COLUMNS AND STANCHIONS.

As columns and stanchions carry the greatest concentrated loads found in modern buildings, the proper fireproofing of these becomes a most important subject for consideration; unfortunately, in only too many cases is this slighted or omitted, even to a very dangerous extent, as has been proved in numbers of instances. Many systems have been introduced, and both the "hard tile," the "porous tile," "terracotta," and concrete have been used extensively. The requirements in the adequate fireproofing of columns and stanchions are:—1. The material must be indestructible by fire. 2. The material must not be heat-conducting. 3. The material must be so secured to the columns or stanchions that it cannot be dislodged. The use of hard fireclay tiles is only to be recommended when such tiles are hollow with a sufficient and proper air-space around the metal column or stanchion, and even then experience seems to show that the hard tile is in no way so satisfactory under great heat as the porous kinds. Application of cold water in combination with heat have also proved the hard tile far less reliable in case of conflagration than the porous tile, as the hard tile is very apt to crack off under such conditions. The use of solid blocks of porous tile well bedded against the metal column or stanchion or solid pumice concrete, seems to be the most highly satisfactory. The requirements for fireproofing the interior columns and stanchions by the Chicago Ordinance are defined as follows:—(1) "The coverings for columns or stanchions shall be, if in brick, 8in. thick; if of hollow tile, one covering at least 2½in. thick. If the fireproofing is made of porous terracotta, it shall be at least 2in. thick, whether hollow tile or porous terracotta is used; the courses shall be so anchored and bonded together as to form an independent and stable structure." (2) "In all cases there shall be on the outside of the tiles a covering of plaster with Portland cement, or of other solid cement of equal hardness and efficiency when set." (3) "If plastering on metallic laths be used as fireproofing, it shall be in two layers, of which the first shall be applied in such a manner that the concrete or plaster will cover the entire external face of the column or stanchion, while the space between the two layers shall not be less than 1in. The metallic laths shall in each case be fastened to the metallic firings and the plastering upon same shall be made with cement."

FOUNDATIONS FOR COLUMNS AND STANCHIONS.

In designing the foundations for columns and stanchions for a building, where they rest upon a yielding stratum, proper provision must be made for the uniform distribution of the weight. In cases where the loads vary, the foundations should be proportioned according to the different loads, so that the bearing per unit of ground area will be equal, and a uniform settlement of the structure assured. Where the loads are excessive an excellent foundation for columns and stanchions can be formed with rolled steel joists, either in a single bed or more, the foundation for them being prepared by a suitable bed of Portland cement concrete of ordinary depth, then placing the joists thereon. Where unusual loads are to be supported, the joists may be crossed in two

or more directions, each at right angles, their distances apart from centre to centre varying from 9in. to 24in., according to circumstances—i.e., length of their projection beyond the masonry, thickness of concrete, estimated pressure per square foot, &c. They, however, should be placed at least far enough apart to permit the introduction of concrete filling between the joists. The most useful application of this system of foundation is on sites where a thin and comparatively compact stratum overlies another of a more yielding nature. By using joists in such cases, the requisite spread at the base may be obtained without penetrating the firm upper stratum or carrying the footing courses down to an unusual depth. In covering the joists with concrete, 6in. should be left at the ends and sides of them, and 1½in. to 2in. on top. A convenient way of doing this is to make a plank frame of the same size as the concrete bed, and at the proper height and perfectly level; after this is filled it is made for the next courses, and so on, the whole exterior rendered with Portland cement, so that no metal is exposed.

THE METHOD OF CALCULATION FOR JOISTS

used in foundations may be stated thus:—The arms or projections of the two lower courses are fixed by the lengths of the upper ones, and by the dimensions of the subsoil area; hence, the question is, how many joists are required?

Let y = projecting arm of any course.
a = width of supporting area.
l = total load on footing.
M = bending moment on one side of layer.

Then the length of joist $= a + y + y = a + 2y$.

Load on $y = \frac{l\,y}{a + 2\,y}$ and since the distribution of the load on every layer is uniform, we have—

$$M = \frac{l\,y}{a + 2\,y} \times \text{lever arm } \frac{y}{2} = \frac{l\,y^2}{2\,(a + 2\,y)}$$

In calculating the lower course, y becomes a known quantity and M an unknown. The usual spacing where three tiers are used is 15in. for lower tier, 12in. for middle tier, 9in. for top tier. For any other spacing of pressure than given, M can be found from the formula—

$$M = P\sqrt{\frac{s\,b}{12}}$$

When P = the projections in feet for the several tiers of beams.
b = the allowable bearing capacity per square foot of ground in tons.
s = spacing in inches.

The method in regard to the calculation of such footings is still an unsettled question, as some engineers claim that the action of the concrete filling, with its tendency to bind the iron and concrete together, causes the foundation to act as a whole, and thus possess a moment of resistance much greater than the sum of resistance of the individual layers. But in view of the uncertainty of such assumption, the method of calculating all moments about the edge of the casting would seem more logical, as well as being on the safe side. In determining the sizes of the joists in any layer, care must be taken to leave sufficient clearance between the flanges to admit the concrete, which must be rammed in place. Hitherto this class of foundation has been but little used in this country, although it has been used in several isolated cases. In Messrs. Jones and Higgins's warehouse, Peckham, it was very successfully used. A modification of the system lends itself readily as foundation for columns, stanchions, and piers for buildings or corner sites, or where the side of the building is of such a nature as necessitates the system being used. It has been used in the construction of the new premises in the Strand, at the corner of Adam-street. In this instance the joists are framed 3in. or 4in. wide, and rest upon the solid concrete foundation, substituting the usual piers and footings for the front walls Another instance is in the building of some flats at Tufnell Park. In this case it was not considered advisable, from the nature of the site and the great expense, to take the walls down to the requisite depth for foundation. Piers about 4ft. square in Portland cement concrete were taken down to the solid strata, and upon these piers a framework of steel joists was built, properly fitted and connected together to carry the external and principal internal walls. By this method, it will be inferred, there is little or no possibility of any one part of the wall subsiding without affecting the general structure. The foundations, basement columns, &c., are either surrounded by constant moisture or by the wet clay or earth itself. For such positions cement mortar should undoubtedly be used, as, from experience, it seems the most perfect conservator of metal work. A further recommendation of the use of cement lies in the fact that the thermic expansion of Portland cement is practically the same as that of steel—a fact which insures perfect cohesion under any changes of temperature. It has been suggested to rely entirely upon the preserving qualities of cement rather than upon a proper painting of the metal work. Professor Bauschinger states that his experiments show a cohesion between steel and concrete after hardening of from 570lb. to 640lb. per square inch, which is more than the tensile strength of good concrete; but in building work a perfect union between the cement mortar and metal work can never be attained at all points, and a thorough coat of paint must be largely relied upon. All constructive steelwork should therefore be well coated with either lampblack mixed with oil, or red lead and linseed-oil, the very best of materials being employed. The oxide of iron or mineral paint which has generally been specified for all painting of the metal-work has been found to separate from the steel and form an oxidation of the metal behind the paint. A mixture of red-lead and linseed-oil is now considered as the best protective coating for iron or steel. Having regard to their importance in steel construction, we have dealt somewhat in detail with columns and stanchions, together with their foundations. We will now proceed to deal with girders, their connections, and bearings, and the various forms of floors.

GIRDERS.

In designing a building numerous cases occur where a single joist-girder will not be suitable, and it may be necessary to increase the length of the spans, so as to reduce the number of the supporting columns or stanchions to the minimum, or perhaps heavy, concentrated loads, such as columns, stanchions, brick walls, chimney-breasts, and stacks, necessitate the introduction of plate and angle-riveted girders, or compound girders of joists and plates. Having calculated the loads on the several girders, it is an easy matter to determine the sections most suitable to the purpose. It frequently happens in designing a building that excessive loads are concentrated at two or more points of the floor, and in order to confine the construction within the limits of the design without increasing the sections where the minimum loads occur, recourse has to be had to various methods. The depth of the girder being reduced to the minimum in order to obtain the required strength, the flanges of the girders must be unusually wide, the webs well stiffened or trussed. An illustration of this occurs in ground floor ceiling of the West Australian Bank, Cornhill, as also the ceiling of the news-room of the Shoreditch Library. Where the ends of the girders rest upon the wall, it is advisable to use steel bearing-plates or joists to distribute the pressure over a greater surface, and thereby prevent the crushing of the material in the wall directly under the girder. In most cases a large tough stone will be sufficient; but where the pressure is heavy, both plates and stone should be used. The average pressure per square foot for brickwork should not exceed 6 tons, and for stone 12 to 20 tons, according to its character. In calculating for loads upon girders where the bricks are laid regularly that the probable line of rupture (providing the girder should fail) will be found to be inside of the sides of an isosceles triangle, whose base is the span, and whose height is one-third of the span; in order to be entirely upon the safe side, the weight of the wall between vertical lines directly over the girder for a height equal to that of the triangle is frequently adopted as the load to be carried. However, it should be noted that for green walls, or walls having openings, this rule does not apply, as the full height of the wall between the points of suppport must be provided for. Where the width of the walls, either internal or external, exceeds 14in. that are supported by girders, it is advisable to use compound girders or plate girders; and where plate girders, it is preferable to have them double-webbed, or box girders, the latter giving greater stability than the single-web girder. In all built girders it is advisable that the flanges alone are to be considered as resisting the bending moments, and both flanges nominally of the same section. No angles used smaller than 2½in. by 2½in. by ⅜in., and no webs of less thickness than ⅜in. Stiffeners of tee or angle-bars must be used where the depth of the girder is above a certain ratio in proportion to the web (say, 70 times), and disposed so as to resist the shearing forces upon the web. In all cases it is absolutely necessary that they are provided at all bearings, and at points of concentrated loadings, and where straight stiffeners are used (they being preferable in girders for building work) the ends of them both top and bottom must fit closely against the flange angles in order to fulfil their proper functions. The safe loads for steel joists are given in the various merchants' catalogues, as also for compound girders made of joists and plates. In designing compound girders—say, of two joists, with plate top and bottom, take the safe load given for the two joists, making due allowance for the quantity of material taken from the flanges in the rivet-holes, and the difference must be provided for in the sectional area of the plates. The distinct functions of the flanges and webs of all girders with thin, continuous webs are that the whole of the horizontal strains must be provided for in the flanges, the web practically taking no part in resisting them, neither are the horizontal flanges considered to take part in resisting the shearing forces, the whole of which must be provided for in the webs. In selecting joists for girders or similar purposes, the proportion of depth to length should not be less than one-twentieth of the span, otherwise deflection may take place. Due allowance must be made for all holes drilled in the joists for connections, &c., more especially for such that are placed in the flanges. The depth of plate girders should be one-tenth to one-sixteenth of the span; the greatest economy of material is perhaps obtained at one-twelfth. For continuous girders or girders fixed at the ends, the depth may vary from one-fifteenth to one-twentieth of the span. The width of the flange not less than one-thirtieth to one-fortieth of the span, and no plates should be less than ¼in. thick. The general formula for plate girders of this class is—

$$S = \frac{W\,L}{8\,D}$$

S = strain on top and bottom flange at centre in tons.
W = weight distributed in tons.
L = length of girder (or span in feet.
D = effective depth of girder in feet.

Steel may be strained to 7 tons per square inch in tension and compression, although some authorities limit it to 6 tons per square inch.

FLOORS.

Before considering the most economical arrangement of steelwork for floors, the question of loads, which very largely governs the design of the floor system, must be examined. The loads in building construction may be classified as dead, live, and eccentric loads, the principal loads affecting the floor systems are:—

Dead loads, comprising all of the static loads due to the constructive parts of a building, stationary machinery, water tanks, or other permanent loads.

Live loads, comprising the people in the building, office furniture, movable stocks of goods, or varying loads of any character.

The maximum live-load per square foot is usually assured as follows:—

For Crowd of people	80lb.
,, Floors of house	40 ,,
,, Theatres and churches	80 ,,
,, Ballrooms or drill-halls	90 ,,
,, Warehouses, &c.	from 250 ,, up.
,, Factories	200 to 450 ,,

While 80lb. is the maximum possible live load per square foot from a crowd of people (unless dancing be considered.) Still, we can hardly expect to realise any such load under the conditions governing an office building. Large crowds very seldom collect in offices, except on the lower floors devoted to stores or banking purposes, and greater allowances are generally made for such places; the ordinary office furniture will certainly not exceed and seldom equal the weight allowed for persons, and hence additional security is introduced. These loads used in the calculations affecting the girders, columns, and stanchions must not be confounded with the required loads for the strength of the individual floors, while the live load per foot super. may be reduced over large areas in proportioning the girders and columns. The maximum possible live load must still be used when any single floor is considered by itself. The practice in America seems to be pretty well defined in the matter of decrease of

live loads per square foot, as they are transferred from beams to girders, from girders to columns, or stanchions, and thence down the columns to the footings. This practice is founded upon the supposition that it is quite possible that the beams may sometimes have to carry their full capacity in live loads, while the chances are increasingly less that the girders or columns will ever be required to carry anywhere near their full capacity if a full load had been assumed. The fully-loaded area would probably never be large, and a girder or column would rarely, if ever, lie in the centre of such area. The effect of a live or moving load, causing vibration in the parts of a structure, is also gradually lessened, as the vibration, if any, is taken up in the transfer of the load from member to member, so that by the time it reaches the footings, or foundations, the live load is ignored entirely. As examples of this system of calculation the following may be mentioned. In the Venetian Building in Chicago, the beams were calculated for the following live loads:—

Upper floors, per foot super.	35lb.
Second, third, and fourth floors, ditto	60 ,,
First floor, ditto	80 ,,

Girders carry 80 per cent. columns 50 per cent. of the loads. The weight of the steel girders, and brick or tile partitions are actually calculated for a typical floor plan, and then rated at so much per square foot of floor surface. The dead loads assumed in the old Colony Building, Chicago, comprised:—

Flooring	4lb.
Deadening	18 ,,
Tile arches	35 ,,
Iron	10 ,,
Plaster	5 ,,
Partitions	18 ,,
Total	90lb. per foot super.

giving the following results:—

	Beams.	Girders.	Columns.	Footings.
Live loads	70	50	40	—
Dead loads	90	90	90	90
Total	160lb.	140lb.	130lb.	90lb.

In the administrative block of the Royal Infirmary, Liverpool, which is five floors high, a similar system of calculation was adopted in regard to the strength for the lower columns and girders. In floors generally, one of the main points to be considered is that they must be firm and rigid, and at the same time as light as possible and subject to no vibration. To insure this desideratum, the joists must be of adequate depth. Where floor framing abuts on girders, it is seated on angles which are riveted or bolted to the webs, and in special cases the joists are angle-cleated to the girders.

STEEL FLOORING.

There are several systems of steel flooring, each having some special features and more suitable for particular purposes:—No. 1 is flooring made of steel trough-bars of various sections and weights per foot, from 4½in. deep to 12in. deep: the depth of the 12in. section can be increased to 15⅝in. deep by the addition of bars. The sections up to 12in. deep are riveted together on the neutral axis, and the sections over 12in. deep require two rows of rivets. This steel flooring is used in the floors of the National Liberal Club, Prudential Building, Holborn, and in the Bishopsgate Goods Depot. Section No. 2 (Messrs. Wm. Lindsay and Co.) is rolled in depths 10in., 12in., 14in., and 18in. if required. In this section it will be observed the riveting is on the top and bottom flange. Section No. 3 is either rolled or pressed in several depths and strengths, and is used as in No. 4, with plain bar riveted to both top and bottom, the edges of the troughs abutting. It is also used as No. 5, with the troughs lapping and one row of rivets top and bottom. Section No. 6 is a simple form of flooring, composed of plain plates and angles riveted and connected. It can be made any strength, depth, or span by increasing the sectional area of the plates and angles, or by increased depth. It is nominally the same price per ton as the other section. Where the ends bear upon the walls, steel or iron bearing-plates must be provided, and it is advisable to keep these plates a little distance in from the face of the brickwork. These several classes of flooring can be fixed either upon the top or bottom flange of the girders, or upon angle-bars that are riveted upon the webs of the girders, and bolted down. These floors are well adapted for warehouses, factories, mansions, and public buildings, or in any situation where great and varia ble strains occur, either by crowds or the vibration of heavy machinery. The strength of these steel floorings when riveted together is considerable, as each trough may be treated as a girder. As the whole is riveted together, no one portion can deflect without dragging down the adjoining troughs for some distance from the point of application of the weight. At this stage it would not be advisable to go into the question of the finishing of the floors, as we consider it ought to be treated separately, or dealt with in a special paper. In order to render a building "fireproof" where steel construction is used, it is absolutely necessary that every member of the construction must be thoroughly and adequately incased in some fire-resisting material, so as to remove the metal from the direct action of the fire; and if this particular is insisted upon, we shall not have such lamentable catastrophes that continually occur, more particularly in city buildings.

At the conclusion of the paper a hearty vote of thanks was accorded Mr. Cunnington on the motion of Mr. B. Flight Fletcher, seconded by Mr. C. H. Brodie, and supported by Messrs. R. Morland, Gifford Read, and Mark Fawcett.

SANITARY WORK.—III.

SINKS.

In its elementary form a sink may be defined as a basin or trough designed to receive dirty and waste waters. Sinks are, however, largely used for washing-up purposes in connection with the varied operations of domestic life. As a consequence, slop or waste waters are formed, each of which may be totally distinct in character, so

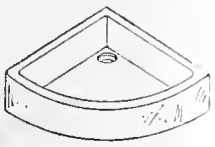


Fig. 27.

that it is not only convenient, but even necessary, that they should be dealt with separately. A type of sink must, therefore, be selected, which shall be suitable for each particular case.

For ordinary household requirements sinks may be divided into five classes—viz., (1) Scullery and kitchen sinks, (2) butlers' pantry sinks, (3) housemaids' washing-up sinks, (4) housemaids' slop sinks or closets, (5) laundry sinks or troughs. They are usually made of glazed stoneware, fireclay, earthenware, slate, galvanised or enamelled iron, and wood lined with copper and lead. Formerly, stone sinks were largely used; but are now practically obsolete. They were most difficult to keep clean, as the stone was found to absorb grease and other impurities, with the result that, after a time, they became most offensive.

For permanent sanitary efficiency it is essential that the materials composing the sink should be non-absorbent, not easily acted upon by acids or

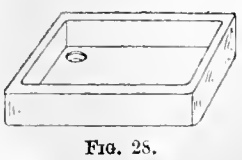

Fig. 28.

alkalies, and having a perfectly smooth surface. The internal angles should be rounded, every part of the fitment being exposed to view, and easily accessible for cleaning purposes. The special requirements of each class of sink in general use will now be considered in detail.

SCULLERY AND KITCHEN SINKS.

These are principally intended to receive the various greasy and dirty liquids which ordinarily arise from culinary operations: they are continually subject to much rough usage, and must, therefore, be thoroughly strong, and impervious to moisture. White glazed fireclay and salt-glazed stoneware provide a very satisfactory fitment for this purpose. They should be free from fire-cracks or flaws of every description.

Enamelled iron sinks—commonly known as "jaw-boxes"—are also largely used in some parts of the country. They are impermeable and easily cleansed, but are liable to damage from rust and chipping of the enamel. In small houses, where no other sink is provided for kitchen use, all the greasy and rough work is carried on here. The vegetables, dishes, cooking utensils, &c., are usually washed in portable iron or wooden tubs set apart for such purposes; the dirty liquids being afterwards emptied into the sink.

Figs. 27 and 28 are illustrations of the ordinary pattern of stoneware scullery-sink. They are comparatively shallow, and as no solid plug is provided to the outlet, therefore no overflow is needed. The waste-pipe from the sink must be

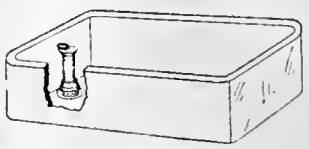

Fig. 29.

trapped immediately under the outlet, and afterwards carried directly through an external wall, so as to discharge over a trapped surface gully. A small anti-siphonage pipe should also be fixed near the crown of the siphon trap, and carried through the outer wall into the open air so as to prevent the water-seal of the trap being broken.

Trapped surface gullies intended for the reception of greasy liquids, as from scullery sinks, &c., must be suitably arranged for the purpose. They should be frequently cleansed by means of the discharge from a small automatic flushing tank. Where large quantities of greasy liquid are discharged, a grease-trap is frequently fixed, the accumulations of grease being then periodically removed by hand from the trap. For large mansions, hotels, &c., separate sinks for washing-up purposes are provided. These are made much deeper than the ordinary form of scullery sink, and are fitted with a solid plug and overflow or a combined plug and standing waste, so that they may be filled with water when required.

Fig. 29 shows a glazed stoneware sink fitted with a visible standing overflow and plug. The top of the overflow is protected by a movable perforated grating to prevent the passage of solids of large size. In this instance the waste is shown

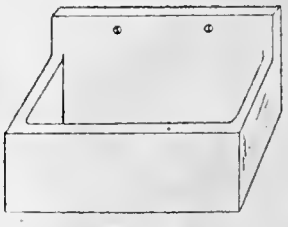

Fig. 30.

fixed to a sink of stock pattern, but it should preferably be placed in a small recess at the side.

An illustration of what is known as a "high back" sink is shown in Fig. 30.

The wash-up sink, shown in Fig. 31—and known as Shank's "Modern" sink—is made in white-glazed fireclay, the outlet being arranged within a small recess at the back, so as to be well out of the way when the sink is being used.

Fig. 32 is the sketch of a combined sink and drainer, formed in one piece of white-glazed fireclay. When in use, a movable wooden grating, or a fluted board of elm or teak is placed on the sloping drainage surface to receive the dishes or utensils after being washed, and thus minimise any risk of breakages.

When separate sinks are provided for washing vegetables, &c., glazed stoneware or fireclay is admirably adapted for the purpose, but for washing dishes, plates, and other ware, they are a fruitful cause of breakages, unless very great care is taken. To avoid this, a loose wooden grating is sometimes fitted to the bottom of the washing-trough.

Enamelled iron wash-up sinks may also be obtained; but they possess no sanitary advantages over those of well-glazed stoneware or porcelain.

Sinks which are chiefly or entirely intended for washing-up crockery are usually made of wood, lined with lead or copper. Lead-lined kitchen sinks consist of a box of well-seasoned

pine or deal, about 12in. deep, and lined inside with sheet lead. The bottom of the sink must be sloped towards the outlet of the waste, which should preferably be provided with an exposed standing overflow. The sheet-lead used for lining

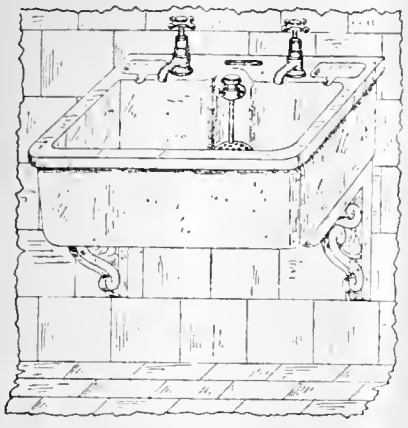

Fig. 31.

purposes must be extra stout, that for the bottom weighing not less than 12lb. per superficial foot, and 8lb. lead for the sides.

A section through a lead-lined wash-up sink is shown in Fig. 33. The trough is made of 1¼in. wrought yellow pine, dovetailed at angles, the bottom tongued into the sides and ends, and the whole put together with white-lead. All the interior angles are filled in with a small triangular or hollow fillet, in order that they may be well rounded. Sheet-lead is then dressed over the top edges and close copper-nailed thereto, all the joints being securely soldered. The sink is

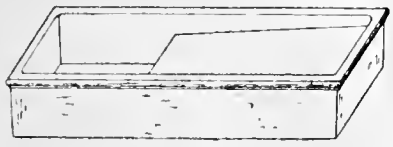

Fig. 32.

finished with a teak or other hard-wood capping secured with brass caps and screws. A perforated brass hollow plug and waste is provided to the outlet, together with a 2in. diameter lead trap and waste-pipe. An anti-siphonage pipe is fixed near the crown of the trap, the waste being arranged to discharge into (or over) a trapped surface gully outside.

A slate or marble slab is sometimes fixed at the back of the sink, or the surface of the wall finished with tiles, or rendered smooth in cement. Frequently the sink is provided with a hard wood

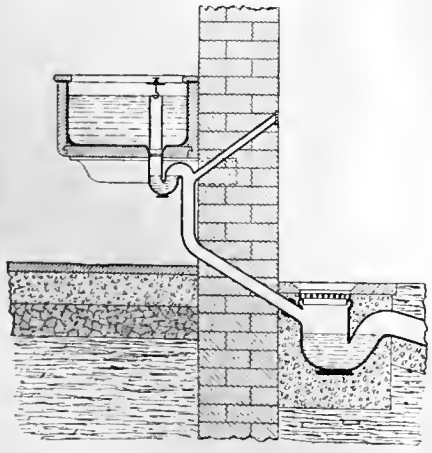

Fig. 33.

cover or top, which is designed to act as a draining board when any washing-up is taking place. Lead-lined sinks insure an impervious and at the same time a soft and yielding surface which is most desirable for washing-up purposes; but the susceptibility of the metal when subject to extremes of temperature causes it to expand and contract considerably. The metal then rises in ridges or folds, and these, after a time, wear into holes, thus necessitating constant soldering and repair. For this reason copper-lined sinks are to be preferred, as they practically possess all the merits of sheet-lead without its corresponding disadvantages. Tinned sheet-copper for the bottom should weigh about 3½lb. per foot superficial, and 2½lb. for the sides. The remaining details of construction are similar to those just mentioned for lead-lined sinks (see Fig. 33).

Fig. 34 is an illustration of Jennings's copper-lined wash-up sink, provided with two compartments, the ware being washed in one and afterwards rinsed in the other. Each compartment is provided with an exposed standing overflow and waste, the wood capping and grooved draining-boards being of teak.

BUTLERS' PANTRY SINKS.

These are entirely reserved for washing-up glass, china, and other fragile articles which require a more careful handling than is usually obtained in the average kitchen. As indicated by the name, they are generally fixed in the butler's pantry. A lead- or copper-lined sink, similar to those already described, should generally be provided in preference to stoneware, fireclay, or enamelled iron, so as to reduce the risk of breakages to a minimum. The pantry sink may also be advantageously divided into two compartments, for washing and rinsing respectively, whilst the draining-board may be of plain grooved teak, or covered with lead, pewter, or copper. Sinks are sometimes made entirely of wood, the metal lining being omitted. Such a construction is not only objectionable on sanitary grounds, but they

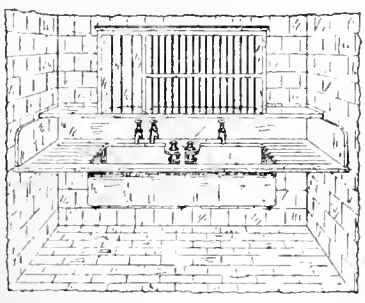

Fig. 34.

are also quite unfitted to withstand constant wear and tear.

HOUSEMAIDS' WASHING-UP SINKS.

Glazed stoneware or porcelain sinks are largely used for this purpose; but unless care is exercised they are apt to prove destructive to toilet-bottles and jugs when these articles are being cleaned and refilled with water. If preferred, a copper or lead-lined sink may be substituted as being less dangerous to bedroom ware. The sink should be conveniently placed for serving the bedrooms, whilst both hot and cold water should be laid on for the convenience of the servant.

Sinks similar to those shown in Figs. 29 and 30 may be used for housemaids' washing-up purposes. The standing overflow and waste shown in Fig. 29 should be placed in a small recess at the side or back. The waste from the sink must be properly trapped, and discharge into a vertical waste outside the building. The upper end of the vertical external waste should be carried above the eaves, whilst the lower end is arranged to discharge into or over a trapped surface gully. An anti-siphonage pipe should be fixed near the crown of the trap under the sink, and connected to the vertical waste outside, so as to properly maintain the water-seal of the trap. In many instances the housemaids' washing-up sink and slop-sink are combined so as to practically form one fitment. The waste-pipe from the wash-up sink may then be arranged to discharge into the basin of the slop-sink, instead of being separately carried outside the building.

HOUSEMAIDS' SLOP-SINKS.

As these conveniences are intended to receive the slops and other fouled liquids from bedrooms, it is necessary that they should be designed and fixed on similar lines to those laid down for watercloseets. In fact, for small houses the watercloset also acts as the slop-closet to the dwelling. For buildings where a separate slop-sink is required, the simple and inexpensive pattern shown in Fig. 35 is largely used. It is suitable for the corner of a housemaid's room, and stands within a glazed stoneware safe. The sink is of the same general form as a wash-down closet, and must be fixed in the same manner.

LAUNDRY SINKS OR TROUGHS.

Fixed laundry sinks or troughs are not usually considered necessary for small houses. The soiled linen is either washed at stated intervals in a

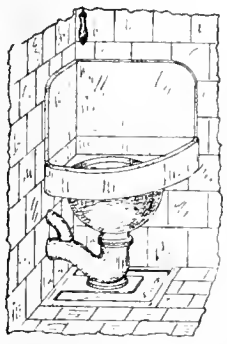

Fig. 35.

portable galvanised iron or wooden washing trough, or else sent to a public laundry. For large mansions, hotels, and other similar establishments where a certain amount of washing must be constantly carried on, an outbuilding is usually set apart for this particular purpose, and fitted up with a series of laundry troughs and other appliances according to requirements.

Fig. 36 is a sketch of a white enamelled fireclay laundry sink or washtub arranged with soap-trays and holes for hot and cold water supply-taps. A 2in. diameter waste, fitted with brass washer, chain, and vulcanite plug, is fixed in the bottom of each trough. Where a range of troughs is provided, the wastes may discharge into a surface channel formed in the floor, which, in its turn, discharges over a trapped gully outside. The surface channel should be frequently and thoroughly cleansed by hand. Instead of discharging into a surface channel, the wastes are sometimes connected by means of a main waste-pipe designed to discharge outside; but the pipe soon becomes foul with soapy and other matters, and cannot be readily cleansed.

Owing to the great weight of fireclay and stoneware wash-tubs, they are usually supported on white enamelled piers of the same material, instead of brackets. The edges of the supports

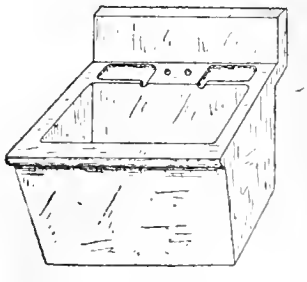

Fig. 36.

should be well rounded, and the piers so constructed that the space under the troughs may be easily kept clean.

Where a large amount of rough treatment is anticipated, strong wooden troughs are frequently used. They are made of well-seasoned yellow deal or pine 1½in. thick, wrought, grooved, tongued, and bolted together with ⅞in. copper or gunmetal bolts, the joints being put together with white-lead. The front is made to slope slightly towards the bottom. The internal dimension of each trough is usually about 2ft. 6in. by 1ft. 6in., and 1ft. 3in. deep. Wooden laundry troughs are inferior to glazed fireclay sinks from a sanitary standpoint, owing to the porous and absorbent nature of the material used in their construction.

THE PROPOSED REGISTRATION OF ARCHITECTS.

UNDER the auspices of the Society of Architects, a meeting was held at the Arts Club, Grainger-street, Newcastle-on-Tyne, on Monday night, to consider the question of the statutory registration of architects. There was a fair attendance. Mr. S. Trevail, F.R.I.B.A., of Truro (vice-president), occupied the chair. It was announced that a large number of replies had been received from well-known architects, encouraging the promoters to persevere in their endeavours to obtain registration. Mr. Ellis Marsland, of London (hon. secretary), gave an address, in which he traced the history of the movement which they were met to discuss. In 1886 circulars were issued, embodying registration proposals, and 1,300 replies were received, with the result that a Bill was introduced in the House of Commons. That Bill included architects, engineers, and surveyors. In 1893, however, a Bill was introduced dealing with architects alone, and had been brought in every year since, being down for reading again in April next. Before success could be looked for, it would be necessary to show that there was something like unanimity among architects on the subject. The Society of Architects was organising a series of meetings in the chief provincial centres, and if it should be found that there was a preponderance of opinion in favour of registration, they would make strong efforts to carry it out. Registration would mean that every man practising architecture was duly qualified by examination. It would close the doors to incompetent men, raise the standard of the profession, secure the confidence of the public, and receive State recognition. It was not proposed for one moment that all who desired to build should employ an architect; but if registration were adopted, henceforth no person who was not qualified would be entitled to call himself an architect. Registration would enable every one to ascertain who were properly qualified. One of the first effects of registration would be to put a stop to the increase of incompetent practitioners. Mr. J. W. Dyson, of Newcastle, moved the following resolution:—"That this meeting cordially approves the principle of the statutory examination and registration of architects, and is of opinion that it is desirable, in the interests of the public and the architectural profession, to promote a Bill in Parliament for the attainment of this object." Mr. Dyson added that they were not in opposition to the Royal Institute; but what, he asked, was the use of an examination unless there were some recognition of it afterwards? Mr. Oad, of Durham, seconded the resolution. Some discussion followed, in which it was suggested that pressure should be brought to bear on the Royal Institute of British Architects to support the registration proposals. One speaker pointed out that it was much more necessary that architects should be registered than plumbers, though he was ready to admit that the latter were a useful and important body of men. Qualified architects had to submit to many disadvantages because of the absence of registration, which, if adopted, would not merely benefit the profession, but would be distinctly in the public interest. The resolution was carried unanimously; and it was resolved that it should be sent to the members of Parliament for constituencies in Northumberland and Durham. Another suggestion which found favour was that the signatures of as many architects as possible be obtained to a petition embodying the resolution.

A new hospital for hip diseases is about to be built on a site of 3½ acres at Tub's Hill, Sevenoaks, the present buildings in that town being quite inadequate. Mr. T. G. Jackson, R.A., is the architect.

A special meeting of the Derby Town Council was held last week for the purpose of electing a candidate to fill the office of borough surveyor in succession to the late Mr. R. J. Harrison. The salary is £600 a year, rising to £750, and there were upwards of 80 candidates for the post. These were reduced to four—namely, Mr. Wm. Dyack, Burgh engineer, Aberdeen (who retired before the voting took place); Mr. R. S. Rounthwaite, borough surveyor of Sunderland; Mr. Howard Smith, engineer of Lynton and Barnstaple (formerly city surveyor of Carlisle), and Mr. John Ward, assistant city surveyor of Sheffield. Mr. Ward was elected, the first choice lying between him and Mr. Howard Smith.

OBITUARY.

Major T. A. Skelton, J.P., architect and surveyor, of Portland-street, Southampton, and of Oakfield, Bitterne, a justice of the peace for the borough, died at Burlington, Shirley, on Friday morning. Some few years ago the deceased gentleman, whilst at Plymouth on business, had a paralytic seizure, from which he really never wholly recovered, although until a short time ago he was able to carry on his professional duties. Major Skelton for a long period was connected with the Southampton Rifle Volunteers, and was formerly secretary of the Conservative party. Major Skelton was added to the Commission of the Peace for the borough on the 27th June, 1892. He leaves a widow and family. Mr. Skelton was a native of Southampton, being a son of Mr. T. Skelton, printer and lithographer. Before his illness he was intimately identified with several commercial undertaking, and aided much in the development of the St. Denys estate, and of estates at Midanbury, Bitterne, and Lyndhurst-road. One of his inventions, which he patented, received much attention from gas engineers and others interested in improved gas illumination in the days when the electric light was yet in its infancy. This was the catoptric lamp, the main feature of which was that the upward rays of the flame from the gas burner were reflected by an ingenious arrangement fitted within the lamp and thrown downward, the light being thus practically doubled. Mr. Skelton was the architect of the present Southampton Workhouse, his plans being selected in competition. He was a well-known amateur astronomer.

Mr. James Barwell, founder of the firm of Messrs. Barwell and Sons, brassfounders, &c., of Great Hampton-street, died at his residence, Hampton-road, Edgbaston, early on Tuesday morning. The deceased gentleman, who was in his 81st year, was a native of Birmingham, and took a good deal of interest in its institutions. Mr. Barwell was a governor of the Bluecoat School for fourteen years, and a prominent supporter of the Church Pastoral Aid Society and the Church Missionary Society. He was a very strongly-pronounced Conservative; but his urbane manner and kindly disposition won for him the esteem of friends of all parties.

The new Wesleyan Methodist Sunday-school, Willington, Co. Durham, has now been completed at a cost of about £900. The architect was Mr. H. T. Gradon, of Durham.

The activity which has been prevalent at the Auction Mart for some time past was fully maintained last week. The aggregate realisation was £165,897, as compared with £102,717 registered for the same period in 1897, thus placing this year, which already holds a considerable lead over its predecessor, still further in advance. The demand for licensed properties has recently slackened, and there can be no doubt that prices have been unduly inflated during the last two years.

The Massachusetts Institute of Technology at Boston is about to make a large addition to the building already occupied by its architectural and engineering departments. The new structure will contain a new laboratory for the department of mechanical engineering, three lecture and recitation rooms, a modelling room, and drawing rooms for the architectural department, the architectural library, gymnasium for women students, and laboratories for the department of biology. In the upper story will be an architectural museum, and some rooms devoted to industrial chemistry.

A general meeting of the heritors of Coldingham has been held in the Priory Church of that parish. The object of the meeting was to receive the report of a committee appointed to inquire as to the preservation of the remains of the old Priory. The committee reported that they had had the benefit of the advice of Mr. A. J. Heiton, architect, and they now recommended that, as a first step, the heritors should authorise them to have the lines of the exterior walls marked out on the turf wherever that could be done without interfering with the graves in the churchyard. The committee further recommend that, when the lines of the old building have been thus ascertained, sepulture should, as far as possible, cease within the old church. Mr. Usher, in moving the adoption of the report, said that, as regarded a suggestion of probable restoration of the Priory, there was really nothing left that could be restored or preserved except the portion of the Priory—the choir—in which they were met. It would not be of practical utility to rebuild the Priory as a model of what had been there.

COMPETITIONS.

Boscombe.—The design submitted by Mr. G. A. Bligh Livesay, A.R.I.B.A., Salisbury Chambers, Boscombe, and Bournemouth, has been placed first, and gained him the premium awarded in open competition for the proposed rebuilding of the Boscombe Hospital. The cost of the entire scheme, which will be carried out in sections, is about £10,000. The assessors were Messrs. Young and Hall, of London.

Putney.—A new public library is to be built at Putney, and a limited competition of designs submitted by the following chosen architects has just been held and decided, a first premium of thirty guineas, and a premium of twenty guineas to be paid to the remaining competitors—viz., Messrs. Maurice B. Adams, F.R.I.B.A.; G. L. and G. R. Crickmay, F.R.I.B.A; S. W. Lee, F.R.I.B.A.; S. Perks, A.R.I.B.A.; and S. R. J. Smith, F.R.I.B.A., the author of the first premiated plan being Mr. F. J. Smith, F.R.I.B.A., whose design has been provisionally chosen subject to the modification of the elevation. The site is in Disraeli-road, and the cost is limited to £8,000.

Wadebridge.—For memorial schools at Wadebridge, Cornwall, fourteen sets of designs were received from different architects, and those prepared by Messrs. Kerley and Ellis, of Exmouth, have been selected as the best. Working drawings and specifications have been made by the above-named architects, who are now inviting tenders for carrying out the work.

CHIPS.

The room facing Queen's Bench Judges' chambers at Royal Courts of Justice, hitherto used for arbitration meetings, is being fitted up as a court, and will in future be known as Queen's Bench Court X. There will be a raised bench for the judge, and a witness-box, but the new court will not be available for jury cases.

A new chapel has been erected at Llandrindod, Wells, and special consideration has been given to the ventilation, which is carried out on the Boyle system.

The additions to the Boothferry-road board schools, Goole, are being warmed and ventilated by means of Shorland's patent Manchester stoves, those previously supplied having proved very satisfactory.

M. Falguière's statue of Dr. Charcot, one of his finest works, is shortly to be placed in the Cour de l'Hospice de la Salpétrière, Paris.

The death is announced of Mr. Thomas Rigby, manager to the Bury Corporation Waterworks. He was a prominent Freemason in East Lancashire. After being secretary to the old Bury Waterworks Company, he was, on the incorporation of the borough, appointed manager of the now extensive Bury Waterworks undertaking.

At Marlborough-street Police-court, on Tuesday, George Veale, a builder, of Dunsmore-road, Stamford Hill, was summoned for obtaining £600 by false pretences from Edward Collins, managing clerk to a firm of solicitors. Evidence was given that the prisoner borrowed this sum, making a statutory declaration at the time that £1,000 was due to him by a brewery company, but that the prosecutor had since found out that a receiving order in bankruptcy had been made against the defendant. The further hearing was adjourned.

Mr. Robert Treloar, of 27, Peckham-road, Camberwell, formerly of Elham, and of the firm of Treloar and Sons, cocoa fibre manufacturers, Ludgate Hill, who died on March 13 last, aged 53 years, left personal estate of the value of £16,413 19s. 1d. He appointed as executor his brother, Mr. Alderman William Purdie Treloar, of Ludgate Hill, and left to him all his real and personal estate absolutely.

The opening services at a new Wesleyan school-chapel in Ladypit-lane, Beeston Hill, Leeds, took place on Monday. Mr. G. F. Danby, Leeds, is the architect of the building, which is a plain structure, built of brick, with stone dressings, and affords accommodation for 250 worshippers. There are three classrooms. The cost has been £1,400. Mr. W. Schofield had the contract for the brick and stone work, and Messrs. J. Tomlinson and Son that for the wood work, a large portion of which is of pitch-pine.

An oil painting by Scott of the Pantiles, Tunbridge Wells, at the close of the last century, has just been presented to the corporation of Tunbridge Wells by Mrs. J. Stone Wigg, as a memorial of her late husband, the first mayor of the borough. The picture will be hung in the municipal gallery, which already possesses two old water-colours of the Pantiles.

WOLVERHAMPTON PUBLIC LIBRARY.

The desirability of placing the main entrance immediately facing Snow Hill has, in common with the first premiated plan,* been recognised in the accompanying design; but the placing of the reference-room along Garrick-street, which is a much quieter street than Cleveland-road, entirely reverses the general contrivance of the scheme as compared with the plan chosen. The curved outline of the frontage, the restrictions as to light on the N.E. boundary of the site, and the very large area stipulated for the lending-library, formed the leading points of the problem, which was unduly hampered by an equally stringent condition as to limitation of cost. The difficulty of lighting ground-floor rooms 50ft. wide by side windows only, has been avoided in this plan, which also has the distinct advantage of conveniently separating the administrative departments of the library from the public part of the building. The waterclosets are placed to the rear, and away from the main entrance. The caretaker's rooms are central, and are reached without passing through any of the public apartments, or the necessity of going outside the building. To economise space, the heating-chamber is located in a half-basement, in the midst of the work to be done by the apparatus. A site is reserved in this plan for the librarian's house. Passages are reduced to a minimum, and the staff can control all the public rooms without leaving the private part of the premises. All the rooms are of the specified areas. The borrowers' space provides counter room for nine indicators, besides seven hatchways and an inquiry counter. Wall room is contrived for the exhibition of the framed displayed catalogue in accordance with the system used at Wolverhampton. Six indicators at least are necessary to work a lending library of two-thirds the dimensions given, and nine certainly will be required when this library is in full work. The reference books in this plan are as close to their readers as the lending library books are to the borrowers. The librarian is situate in the centre of both departments, which are thus under his immediate control, and yet his room is quite private and the working can go on without his being disturbed. The committee approach to this room for meetings has the advantage of being shut off from the public. Terracotta for the dressings being stipulated, the necessity of repeats and smallness of detail had to be recognised, and so had the condition as to the building being made to accord with the idea of a Diamond Jubilee Memorial. These particulars are condensed from the report accompanying this design, which was made by Mr. Maurice B. Adams, F.R.I.B.A., in this limited competition.

* See Building News for March 25, 1898.

TECHNICAL SCHOOL, BOOTLE, LIVERPOOL.

The competition for the proposed technical school at Bootle was decided some few months ago. The town council received twenty-two sets of plans and designs for the buildings, the estimated outlay being £15,000, and called in as assessor Mr. W. E. Willink, A.R.I.B.A., of Castle-street, Liverpool. Acting upon his advice, they resolved, on the recommendation of the Free Library and Museum Committee, to divide the first and second premiums, together amounting to 80gs., between Messrs. Best and Callon, of Prince's Mansions, Victoria-street, Westminster, and Messrs. Woodhouse and Willoughby, 100, King-street, Manchester, and to award the third premium of 20 guineas to Mr. A. J. Rowley, of High-street, Oxford. Although the merits of the first two designs were obviously so evenly balanced that the assessor could not see his way to place either distinctly first, Mr. Willink advised that the plans of Messrs. Best and Callon were "better adapted to meet the requirements of the school," and this view being adopted by the town council, that firm have accordingly been appointed as architects for the building. The accommodation provides for the usual class-rooms and workshops, lecture-rooms, and laboratories, as well as an examination hall to seat from 280 to 300 students. The site is in Balliol and Pembroke-roads. We are promised by the selected architects, Messrs. Best and Callon, of Westminster, that we shall have the loan of their drawings, so that we propose to illustrate the chosen design at an early date.

ALHAMBRA THEATRE OF VARIETIES, ATTERCLIFFE ROAD, SHEFFIELD.

This theatre was opened last January. The front elevation faces the Attercliffe-road. The lower portion of the front is of stone, resting on a base of coloured glazed bricks. The upper part of the two sides of the building is of red brick, the centre being of stucco with carved heads to the windows. The flanking portions on either side, which are devoted to staircases, are carried up to form towers, and these are terminated by lead cupolas and flagstaffs. Arc lamps are suspended over the main portion of the building, and the windows being of stained glass with electric lights behind them, light up the building. The interior of the house is decorated with Moorish designs, and all the fittings are in keeping. The seating accommodation consists of ground-floor area, with a gallery over. There are four direct means of entrance or exit to the ground-floor seats, and two to the gallery. There is also a pass stair between the two parts. The stage has a separate entrance at the back of the building, and in close proximity are dressing-rooms and the manager's office. The building is of fireproof construction, and hydrants are provided in case of emergency. The lighting throughout consists of a duplicate system of electric light and gas, the former being supplied by an engine and plant laid down for the purpose; the gas is only provided in case the electric light should at any time unexpectedly not be available. The theatre has been erected for the Attercliffe Alhambra Company from the designs and under the superintendence of Messrs. G. D. Martin and A. Blomfield Jackson, architects, both of London. The contractors are Messrs. G. Longden and Sons, of Sheffield.

FOUR DEVELOPMENTS OF ONE PLAN FOR A HOUSE COSTING ONE THOUSAND POUNDS.

These designs are by Mr. James Ransome, of London, and are based on some smaller houses of his planning at Wimbledon, Broadstairs, and Haslemere, &c. The sketches illustrate some possibilities of very varied treatment applicable to a plan in itself plain and square, while the arrangement of the rooms is interesting as showing the amount of accommodation that may be contrived within a very limited space. As such the sheet is suggestive.

TWO INTERIORS.

These designs, by Mr. Charles E. Varndell, are for two rooms of a country house. The dining-room, after the Jacobean style, is to be panelled in oak to a height of 8ft. 6in., above which will hang tapestries. The doors and shutters are to have ornamental dull steel hinges. The fireplace sides and hearth will be lined with long narrow red bricks, picked out for their brightness of colour and ruggedness in shape. The face of the chimney-breast would be covered with old Dutch tiles. In the panelling, bookshelves are arranged, the seats being upholstered in a dark green leather. The plaster ceiling will be panelled with moulded oak ribs. In the bedroom an effort has been made to produce a simple and artistic room. The ceiling joists have been left showing, to give it an old-time character. The woodwork is to be in pine, stained a warm brown, and the furniture in ash, stained green.

CONGREGATIONAL CHURCH AND LECTURE HALL, RICHMOND.

Mr. Philip E. Pilditch is the architect of this building, of which no further particulars have reached us.

STAIRCASE HALL, AULDWOOD, SEABRIGHT, N.J.

We have no particulars of this work, which has been carried out from the designs of Messrs. Shepley, Rutan, and Coolidge, architects, whose work, as here seen, is refined and suitable for its purpose and position. The scheme is, to some extent, based upon historic examples, and the style seems well adapted to modern requirements.

*** We are informed that the two stained-glass cartoons published by us last week were designed for Messrs. Walter J. Pearce, Limited, of Albert-street, Manchester, who executed them for their own showrooms. This information was not in our hands when we gave the drawings referred to.

CHIPS.

The new Wesleyan Methodist day-schools at Sacristan, Co. Durham, are to be opened at Easter. Mr. H. T. Gradon, of Durham, is architect for both schools and church.

In memory of the former vicars of the parish, St. Martin's Church, Leicester, has been restored, and a new south porch, erected by subscription, has just been dedicated. The entrance is enriched by four full-length statues of Bishop Magee, St. Hugh, Bishop of Lincoln, Bishop Grostête, and St. Dunstan. These are the work of Mr. Nathaniel Hitch, of Vauxhall. About £800 is to be spent in renovating and improving the organ of the church.

Colonel C. H. Luard, C.E., held an inquiry at the Southport Town-hall on Friday week, on behalf of the Local Government Board, into an application by the Southport Town Council for power to borrow £21,178 for electric lighting and £18,070 for street improvements. The electric light extensions consist of the erection of a 600-unit engine and alternator combined, the laying down of two main cables to the town, and various works connected therewith.

A stained-glass window has been placed in Corstorphine Church, N.B. The window is of three lights with tracery, and is situated in the north transept. The designs are in six groups, illustrative of the Acts of Mercy. The artists are Messrs. Ballantyne and Gardiner, of Edinburgh.

The churchwardens of St. Mary-le-Quay Church, Ipswich, have received a report from Mr. E. F. Bishop, of that town, architect, stating that, owing to the spread of dry rot, the fine hammer-beam roof of the nave and the aisle roof are in an unsafe condition. They have, therefore, closed the church, and are appealing locally for funds for its restoration. The church, which is in a poor district, and is slenderly endowed, was built in 1448.

There are in course of erection naval workshops at Port Edgar, South Queensferry, N.B. These are to include carpenters' and shipwrights' departments and blacksmith's shop. The erection is some 50ft. by 40ft., and is laid with concrete flooring.

On Monday next, the Great Northern Railway Company will open an important link of their system in the Nottinghamshire district, consisting of a new line forming part of the Leen Valley extension. The railway joins the Leen Valley line at Annesley, and, when completed next year, will extend to Pleasley—a distance of nine miles; but at present the line has been carried as far as Skegby only, or a length of five miles. The railway gives access to collieries at Kirkby, Teversalt, and Pleasley, and when laid throughout will also extend to the Shirebrook and Langwith collieries.

The Coventry and District Master Builders' Association have presented a petition to the corporation of that city calling attention to the requirements of the city surveyor with regard to workmen's houses, to the alleged unnecessary expense, and the impracticability of these requirements. The general purposes committee of the corporation have instructed the surveyor to report on the question. He has already stated that he simply enforced the city by-laws, which have been in force some years, and are founded on the model code of the Local Government Board.

Building Intelligence.

Kennington, S.E.—A new theatre is being built in Kennington Park-road, from designs by Mr. W. R. G. Sprague. It will have frontages of about 80ft. to Kennington Park-road, 150ft. to South-place, and 90ft. to De Laune-street. The main frontages will be executed in white Portland stone. The elevations are of Italian Renaissance character. The more expensive parts of the house will be entered from Kennington-road by a few broad steps running the entire length of the 50ft.-wide colonnade into a vestibule, and thence to the grand crushroom, which will be 42ft. by 22ft. The walls will be of an Italian marble, and recessed marble columns will be employed. From this crushroom one ascends a marble staircase 27ft. wide, branching off on each side to the dress-circle, with a separate entry to each side of the stalls. Above the main crush-room will be a ladies' foyer and the grand saloon. Throughout the interior the decoration will be French Renaissance in style, with a free introduction of paintings on ceilings and panellings, whilst the draperings and colourings throughout will be of soft tints, with a free use of gold. The auditorium will have a depth of 70ft. and a width of 60ft., and will be constructed on the two-tier system. The electric light will be employed. Exceptionally large saloons are adjacent to each part of the theatre, the pit saloon having the walls entirely covered by fancy tiling. The gallery staircase and pit entries and exits are lined with white glazed bricks. The theatre throughout will be heated and ventilated on the plenum system. The stage will be fitted with a special double asbestos and steel fire-proof curtain, controllable by one man. The stage will be about 80ft. wide and 50ft. deep. Large scenery stores, painting-rooms, and property-rooms are included in the scheme. Mr. Sprague hopes to have the theatre ready in November.

London County Council.—At Tuesday's meeting an animated discussion took place on a recommendation of the General Purposes Committee that the extreme end of the Victoria Embankment wall, by the corner of Westminster Bridge, be approved as a suitable site for the Boadicea statuary group, by the late Thomas Thornycroft. Eventually the recommendation was agreed to by 78 to 36 votes, a proposal to defer consideration of the recommendation for three weeks, and to take the opinion of the Presidents of the Academy and the Institute of British Architects and the First Commissioner of Works being rejected. It was referred to the Improvements Committee to bring up a scheme for the embankment of the Thames from the Victoria Tower-garden to Lambeth Bridge. It was referred to the Technical Education Board to consider the suitability of the Crystal Palace as a centre of technical instruction, and to ascertain the terms on which certain parts of the building and grounds could be acquired for such a purpose.

Manchester.—The Owens College buildings, Oxford-street, will receive in the course of the next eighteen months an addition by the erection of the new Whitworth Hall, for which preparations are now in a forward state. The hall, standing at the intersection of Burlington-street and Oxford-street, will complete the college quadrangle, and will form a connecting link between the museum and the Christie Library. Messrs. A. Waterhouse and Son, the architects of the college, in preparing plans for the new edifice on a scale of dignity worthy the importance of the site, have adopted a modification of the style employed by them in the museum. Constructed of Minera stone, the eastern side of the hall, fronting Oxford-street, will rise to a height of 50ft. It will be pierced by a double row of windows, of which the lower will be somewhat plain in character; while the upper tier will consist of four large cusp-headed, transomed, two-light windows. The principal public entrance to the building from Oxford-street will be emphasised by two small pinnacled turrets rising to a considerable height, while the gabling over the doorway will contain lancet windows. Immediately beyond this feature will rise, at the south-eastern corner of the building, a turret, which, with its fellow at the opposite angle, will flank the great traceried Perpendicular window in the south front. Both towers will contain staircases, and the westernmost of the pair will mark the entrance to the hall from Burlington-street. Within the building, on the ground floor, will be arranged a number of small apartments for examination. Above them, along the entire length of the building, will be the great hall, which will measure just over 120ft. by 50ft., its height up to the roof-plate being 35ft., and to the visible apex 56ft. 6in. This open-timbered roof will represent a modification of the hammer-beam treatment. The organ is to be placed in the north gallery. At the other end of the building there will be not a gallery proper, but tiers of seats rising one above the other from the floor of the hall. Seats will be found for 977 persons, including the orchestra. For heating purposes a system of warm air, avoiding the use of radiators, will be adopted. The total cost is estimated at about £42,000.

Metropolitan Asylums Board.—At Saturday's meeting of this board the South-Western Hospital Committee presented a report prepared by Mr. T. W. Aldwinckle in regard to the accounts for alterations and additions at the South-Western Hospital. The amount of the contract, as sealed, was £24,300, and the total accounts amounted to £28,857 16s. 6d.—a difference of £4,557 16s. 6d. The report was referred to the finance committee for consideration and report. Mr. Brass moved a resolution to the effect that the question of the expenditure on the Brook Hospital be referred to the general purposes committee, with directions to instruct a solicitor to take the opinion of counsel as to the liability of the architect, Mr. T. W. Aldwinckle, to refund the managers all or any portion of the cost of the extra works or claims ordered or allowed by him on his own responsibility. Ultimately an amendment by Mr. E. White was accepted and agreed to, in favour of obtaining an opinion on the general question of the personal liability of architects for work ordered by them without authority.

The Passmore Edwards Institutions.—Sir John Lubbock, M.P., opened the public library, Hoxton, on Wednesday afternoon. This has been built by Mr. George Hooper, from plans by Mr. Charles Bell, F.R.I.B.A. Mrs. Creighton, accompanied by the Bishop of London, will open the hospital and nurses' home, Acton, at 4 o'clock on May 5. This building has been erected from plans by Mr. H. T. Hare, F.R.I.B.A., whose design, selected in competition, was given in our issue of Dec. 13, 1895. On May 12 the Duchess of Marlborough will open the home for epileptic men, the Victoria House, at Chalfont, Buckinghamshire, and immediately afterwards the Duke of Marlborough will lay the foundation stone of the home for epileptic boys, while Mrs. Passmore Edwards will perform a similar ceremony for the home for epileptic girls. These three homes, which are being built from plans by Mr. Maurice B. Adams, F.R.I.B.A., were illustrated in our issue of June 25, 1897. A little later in May Sir H. H. Fowler, M.P., will lay at Clacton-on-Sea the foundation-stone of a holiday home for children, with 80 beds, to be maintained and administered by the Sunday School Union. Of the latter building Mr. Charles Bell is the architect.

CHIPS.

The new baths which the Leeds Corporation have erected in Holbeck-lane, Holbeck, are to be opened to-morrow (Saturday) by the chairman of the Leeds Baths Committee.

Owing to the opposition raised by the Ipswich Corporation, the Great Eastern Railway Company have withdrawn from their General Powers Bill, now before the House of Commons, the section asking for powers to construct a dam over the River Orwell, just below Stoke Bridge, Ipswich.

A Local Government Board inquiry was held on March 24, before Colonel A. J. Hepper (inspector) in the Municipal Offices, Liverpool, touching the applications by the corporation for powers to borrow £2,000 and £600 for the purpose of recreation grounds. Mr. Pickmere, deputy town clerk, and Mr. Shelmerdine, surveyor, represented the corporation.

The excavations of the Greek Archæological Society at Thebes, in Bœtia, have brought to light a necropolis of the Mycenæan age, the tombs of which are similar to the rock-tombs of Argolis and Attica. The richest amongst them contained personal ornaments in gold and bronze of the Mycenæan type, and objects of Egyptian porcelain.

The Mersey Docks Board have decided to increase the salaries of Mr. W. Brodie, head of the drawing and general offices, from £450 to £500 per annum; and of Mr. W. L. Wallace, surveyor and measurer-up of all work done under contract, from £330 to £350.

PROFESSIONAL AND TRADE SOCIETIES.

Edinburgh Architectural Association.—The members of this association visited, on Saturday afternoon, the Scottish Museum of Science and Art, Edinburgh, by the kind permission of Sir R. Murdoch Smith. The curator, Mr. D. J. Vallance, who conducted the party, gave a general description of the building, the dates and methods of its construction, the precautions taken against fire, the heating arrangements, and the workshops. Explanatory remarks were also given of the arrangement of the collections, and attention was drawn to the more important specimens. At the conclusion of the visit, Mr. Thomas Ross (president) proposed a vote of thanks to Mr. Vallance.

Manchester and Salford Building Trades Association.—The annual general meeting of this association was held at the Albion Hotel, Piccadilly, on Monday, the 21st ult. Mr. George Macfarlane, vice-president, in the absence of Councillor W. Holland, J.P., president, occupied the chair. After reading the annual report, which was adopted, the president, vice-president, treasurer, and council were unanimously re-elected. The chairman, in his address, stated that the previous week the final arrangements had been made and officers elected, forming a Federation of Building Trades Employers for Lancashire and Cheshire. This combination of building trades employers embraced, along with Manchester and Liverpool, twenty-four of the largest towns in Lancashire, and also some of the towns in Cheshire. The purpose of the Federation is to unite all the local associations connected with the building trade throughout Lancashire and Cheshire, and form builders' associations in towns and districts where they do not already exist. This plan of federating local associations with a county federation is part of a national scheme whereby all England and Wales is first apportioned or divided into county districts, then into national association centres. A map has been prepared, showing fourteen county divisions—these, again, are combined into five national centres—the National Association of Master Builders of Great Britain, being the head, uniting all. Thus every town and every group of villages would have a Masters' Association dealing with matters immediately connected with their own locality, the county division dealing with wider and more important issues, while the National Centre would focus the power of all the constituent associations. By this scheme a truly national association will be formed that will have strength and weight to deal with any matters affecting the building trades. In Manchester, they had difficulties before them in two of the building trades. The carpenters and joiners have given notice for alterations to their working rules, which, if adopted, would seriously affect employers. They trust, however, that some mutual concessions will overcome the present difference. The stonemasons have also sent in notice for another 1d. per hour, and rather drastic alterations to their working rules. If such stringent working rules as the masons now wish to enforce were adopted by all the other trades in the country, England would, in a few years, become a third-rate power, and such a thing as free trade would be unknown. The limitation of apprentices question is a very serious one, producing a marked scarcity of workmen in the trades affected. Mr. Walter Marshall, stonemason; Mr. W. Higson, jun., plasterer and painter; Mr. Henry Matthews, builder; Mr. Frank Williams, plumber; Mr. Ames Mason, plasterer; and Mr. J. Daniels, builder, spoke upon the importance of getting the various members of each trade to join their several associations. The necessity of having a Builders' Institute or Building Trade Exchange was raised by some of the members, and the secretary, Mr. Fred Scott, was asked to communicate with those towns who had already formed such an institution for information as to their constitution and working.

A Dominican church is about to be erected at Charlestown, near Pendleton, from plans by Messrs. Sinnott and Powell, of Manchester and Liverpool. The building will be Gothic in character, and will be dedicated to St. Sebastian the Martyr.

An important meeting was held at the Stratford Room, Grand Hotel, Birmingham, on Wednesday week, attended by representatives of the building trade in the Midland Counties. The gathering was convened for the purpose of forming a Masters' Federation, and was well attended.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., L., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

GOOD FRIDAY.

Next week the Building News will be published on THURSDAY. All Advertisements for the next issue, therefore, must reach the Office by THREE p.m. on WEDNESDAY NEXT, instead of on Thursday, as usual.

J. D. (Better try silicate cotton. See recent replies in "Intercommunication.")

Correspondence.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

To the Editor of the Building News.

Sir,—Yours is the only journal in which members can express their disapproval of anything done by that august body the Council.

I want to know why Mr. Aitchison should be asked to serve another year, when there are plenty of good men who should have a chance? To re-elect the president is a confession of weakness in any large society. It is not as if the present president had designed a vast number of buildings, and made a great name; in fact, when you are asked by any member of the public to name some great building of great beauty and excellence, you find it difficult to answer, so have to state that he is a very scholarly, genial man.

Then why should architects over forty years of age be unable to compete for the prize essays, as it is in middle life that men generally can, from their experience, find something interesting and instructive to write about?

Finally, does the present system of electing Fellows quite give satisfaction, as the Council set aside all the benefit of well-known sponsors, and judge the candidate by the drawings submitted? Thus, a man who has been trained as an architect, but through lack of friends has carried out very little work, is rejected; while the ex-builder's clerk or land agent, who has carried out a number of important jobs by the aid of able assistants, is admitted, although probably he never made a drawing with his own hand in his life.

The poor attendance at the ordinary meetings should have the immediate consideration of the Council.—I am, &c., Associate.

CHIPS.

The Archæological Museum of Berlin has received permission from the Sultan to make excavations at Miletus. The work will begin next autumn, under the direction of Dr. Wiegand.

Premises in Liverpool-street, Southampton, are being pulled down to make way for a new theatre, to be built for Messrs. Morell and Mouillot. The theatre will have a tower 82ft. in height, and will be isolated on three sides. Accommodation will be provided for 1,800 people. Messrs. Jenkins and Son, of Southampton and Bournemouth, are the contractors.

A joint deputation of the County Councils Association, the Association of Municipal Corporations, and the Association of Technical Institutions waited upon Sir John Gorst at the Privy Council on Wednesday week, in order to lay before him the views of the associations in regard to the recent decision of the Government abolishing building grants from Imperial funds to schools and institutions under the Science and Art Department. The speakers especially dwelt on the inconvenience caused by the withdrawal of the grants without previous notice. Sir John Gorst promised to bring the views of the deputation before the president of the Council.

As a memorial to her uncle, the Earl of Shaftesbury, Miss Ashley, of Stratton Manor, Dorchester, has presented to the Dorchester Union Workhouse a new chapel for the use of the inmates.

The formal ceremony of opening the new annexe of the Central London Ophthalmic Hospital, Gray's Inn-road, was performed on Friday by the Lady Mayoress. The hospital was established in 1844, and until 1882 it occupied only one house at the corner of Calthorpe-street. Then it acquired the next house, and now it has absorbed the two adjoining. The last extension, which has cost £1,700, has raised the accommodation from 12 to 28 beds. The committee have in view the demolition of the whole block, and the erection of a modern hospital upon the site as soon as the funds will permit.

A new county school for Flintshire has been built at Penymaes, near Hollywell, and will be opened by the Duchess of Westminster about a week hence. The building is carried out in red Ruabon brick in the Domestic Tudor style. The contractor was Mr. Matthew Rogers Flint, and the architects were Messrs. Bellis and Grierson, Bangor.

The whole of the block of buildings of the up-platform refreshment-rooms at Swindon Station, on the Great Western Railway, were burnt out on Saturday morning.

The death has occurred at the Johnson Hospital, Spalding, of Mr. Edward John Tatam, at the age of 53 years. The deceased was a civil engineer, and was a well-known authority on drainage matters in the Fen districts.

The Railway Department of the Dominion Government has just presented its annual report, which shows that the last fiscal year ended (on July 1, 1897) with 16,687 miles of railway completed and 16,550 in operation in Canada, the former total showing an increase of 300 for the year.

An inquiry is being made by the committee appointed by the Home Secretary into the extent to which water gas and other gases containing a large proportion of carbon monoxide are being manufactured and used for heating, lighting, and other purposes, and the dangers which may attend such manufacture and use. The committee is composed of Lord Belper, chairman; Mr. H. H. Cunynghame, Assistant Under-Secretary of State for the Home Department; Dr. Marsons, Local Government Board; Dr. Haldane, and Professor Ramsay, with Mr. J. Pedder, of the Home Office, as secretary.

Col. Waring, Street Commissioner for the City of New York, is given as authority for the statement that ashes mixed with lime make a mortar superior in point of lightness and strength to mortar composed of lime and sand. By the substitution of ashes for sand the cost of the mortar would be reduced by more than one-third.

Mr. R. E. Paget, vestry clerk of Clerkenwell, has received a letter from the secretary of the Metropolitan Railway Company, informing the vestry that his directors had under consideration the question of providing a station at Rosebery-avenue, between King's-cross Station on the one hand and Farringdon-road Station on the other.

Intercommunication.

QUESTIONS.

[11923.]—**Note on Crane Scaffolding Calculations.**—(1) It seems doubtful whether the structures for cranes, if composed of three legs or towers bound together by diagonal braces and also by lattice frames connecting their tops, should be considered as one triangular frame with sides of 60ft. long or thereby; or as three independent towers, each from 10ft. to 18ft. square; but it is considered reasonable that each tower should be able to stand alone. (2) The horizontal wind pressure on vertical surfaces is stated to rise to 50lb. per super. foot (see Rivington, part IV. table 14, p. 339); but this pressure is called by authorities a "violent hurricane" (Hurst, p. 140). On this datum the whole question rests, and Hurst's table above quoted rises from a "fresh breeze" of 15 miles an hour giving a pressure of 1½lb. per foot, to a "storm" of 50 miles an hour giving 12½lb., and a "violent hurricane" of 100 miles an hour giving 50lb. (3) The wind is the main force to be considered as opposed to the stability of the tower, for in a height of 64ft. and a dimension of say 10ft. by 10ft. this supposed possible wind force, if square on the side of the tower, would have a moment of 64ft. by 10ft. by 50lb. by 32ft. (height of centre of gravity), which equals 457 tons on a solid structure, or 45·7 tons on one nine-tenths hollow on the side. This very far exceeds any weight or strain to be otherwise brought to bear, for the boiler, crane, and load would not generally exceed about 15 tons, standing on all three towers. (4) Suppose the tower to be of solid wood at 32lb. weight per cube foot, then 64ft. by 10ft. by 10ft. by 32lb. by 5ft. (distance of vertical line of gravity from fulcrum) equals 457 tons—*i.e.*, the tower would be in equilibrium, but have no factor of safety during a "violent hurricane," giving a wind-pressure of 50lb. per square foot. (5) If, again, two-thirds of this supposed mass were hollow, and the side acted on by the wind contained ⅓ one-third or ⅓ the solid contents, then the material would have to be three times the above weight, or 96lb. per cubic foot, and could not, therefore, be of wood if only 10ft. by 10ft. = 100sq.ft.; but it might be so if √300, or, say, 18ft. by 18ft. (6) Consider, therefore, a tower 18ft. by 18ft. framed of four legs of wood at 32lb. per cubic foot, and having each leg x^2 in scantling, then—

Wind-pressure = 64ft. × 2x × 32ft. × 50lb. = 251 tons
Weight moment = 64ft. × 4x^2 × 32ft. × 9ft. dist.
= 9 × 28 tons—(equal.)

Whence x = 2ft. 9in.—*i.e.*, the frame would be in equilibrium if on four wooden legs each 2ft. 9in. square, in a violent hurricane. (7) The lattice-framing has not been considered; but it is supposed above that the 64ft. long legs are sufficiently stiffened thereby to be kept straight. The lattice is mainly useful for this end, and it is suggested that it would probably hold the wind sufficiently to counteract much of its strength. The bending stress of a load of 15 tons on top of three towers, each weighing 28 tons, may be safely neglected; but the additional weight of five tons on each tower, and the substitution of wood, which weighs 36lb. per cubic foot, would reduce the requisite scantling to 2ft. 7in. by 2ft. 7in., or 961sq.in., to be in equilibrium in a violent hurricane. So proportionately per square inch of section, according to Hurst, a stiff leg of 7¾in. by 7¾in. would cause equilibrium in a "brisk wind" of 25 miles per hour, giving a pressure of 3⅛lb. per super. foot.—Nisi Dominus Faustra.

[11924.]—**Terracotta Work.**—Will some practical reader enlighten me as to the best size of blocks, where the best terracotta for architectural purposes can be obtained, how the pieces are to be set, and any point to insure good work—what thickness of joint, and what mortar?—Nota Bene.

[11925.]—**Gauged Work.**—Is there any work treating on ornamental brickwork, gauged or rubbed, and the name of it? I shall be glad with a reply.—W. H. H.

[11926.]—**Size of Chimney Stack.**—Will any practical reader tell me the best size for flues in the stack for a three-story building? A flue 14 by 9in. is awkward. Can these be made square at the top, and which is the best way to gather the brickwork together?—A Student.

[11927.]—**Extra Commission.**—A. employs an architect to carry out certain works. The architect, in the usual course, employs a quantity surveyor. The contract is let, and the work completed. The contractor complains that the quantities are in certain items short, and submits an account of what he considers to be the correct measurements. It then becomes necessary that the work should be measured up. Is the architect entitled to any further commission for satisfying himself and his client that the amount claimed is really due before granting a certificate, or can he refuse to do so, and merely give a certificate on the finding of an independent surveyor? If the latter, who is liable to the surveyor for his charges? Or, briefly, is an architect entitled to extra commission for measuring up work for the purpose of granting certificates on account, and on completion for the total amount expended? Perhaps Mr. Lovegrove or Mr. Fletcher would be good enough to answer this.—Sic.

[11928.]—**Workhousee.**—Will any of your readers with experience in the planning or carrying out of the above kindly inform me what would be a reasonable price, per inmate, to allow for a workhouse to accommodate, say, 1,200 to 1,400, exclusive of site?—Omega.

REPLIES.

[11922.]—**Cleantng Headstones.**—I should think the application of acid to stone or marble would injure the surface. I should rather wash it well with one of the prepared soaps, or rub it with stone.—G.

The corporation of Canterbury are about to build a city lunatic asylum on the Stone House Estate, Littlebourne-road. Mr. W. J. Jennings, of Canterbury, is the architect, and buildings, two stories in height, will be built for 250 patients behind the existing premises, which will be utilieed for administrative purposes.

LEGAL INTELLIGENCE.

Francis Morton and Co., Limited.—In the Court of Chancery of Lancashire, at St. George's Hall, Liverpool, on Monday, Vice-Chancellor Hall presiding, Mr. John Rutherford said that in regard to the case of "Francis Morton and Co., Limited," he appeared in support of a petition by a creditor for the winding up of the company, a voluntary winding-up resolution having been adopted in January, 1897. However, nothing practical had been done, and the question was whether or not an end should be put to the matter. The petitioning creditor claimed £1,117 13s. 10d. and costs of judgement. Mr. Rotch, on behalf of the company; Mr. Durandu, for the second debenture holders; and Mr. Hughes, for creditors representing £16,000 out of a total liability of unsecured debts of the £23,000, opposed the application. The preliminaries necessary to the motion had not taken place before the Registrar. The Vice-Chancellor said he could make no order, especially in face of the opposition offered by Mr. Hughes. He would, however, give leave to amend the petition by asking, in the alternative, for a previous order, and meanwhile the petitioner could go before the Registrar, and put everything in order. Answering the Vice-Chancellor, Mr. Hughes explained that negotiations were proceeding for the sale of the concern, and unless it were disposed of at a good price, there would be nothing left for the creditors after satisfying the debenture holders. The Vice-Chancellor said he would not allow one man to wreck the company, if there were any chance of keeping it afloat; but he could not at present dismiss the petition.

A Question of Custom.—At Marylebone County-court, on Tuesday, before his Honour Judge Stonor, Messrs. H. E. Foster and Cranfield, surveyors, claimed £44 14s. 6d. from Mr. Wm. Dean, a retired licensed victualler, at present residing at Shooter's Hill, Kent, but formerly of Malvern Tavern, Notting Hill, W. Mr. G. M. Cohen and Mr. E. J. Green appeared for the plaintiffs, and Mr. D. M. Kerly for the defendant. Mr. Green stated that in May, 1870, a Mr. Crewse became the freeholder of Malvern Tavern, and shortly afterwards granted a lease to another man, under whom the defendant became a lessee. About 1892 the defendant proposed to make certain alterations in the property, and this coming to the knowledge of Mr. Crewse, he wrote to the plaintiffs instructing them to write to the defendant asking for specification and plans. The plaintiffs, acting in the interests of the freeholder, were continually upon the property, and the amount now claimed was in respect of such works for which the defendant was liable. The Judge: Had you any authority for it? I do not see that the defendant is liable. Mr. Green: I shall show that it is the usual custom. The ground landlord was getting no benefit out of the alterations. The Judge: I shall ask for some authority, or I shall rule to the contrary. Mr. H. E. Foster deposed that he had previously been instructed in similar cases, and had always been paid by the lessee. Mr. Kerly: There surely cannot be a question of custom here. In answer to Mr. Kerly, witness admitted that the plans were made for the landlord's guidance and as a record of what had been done. He had regarded Mr. Crewse from first to last as his employer in the transaction, with the exception of some work done in regard to ancient lights. The whole bill had been made out in the name of Mr. Crewse, and sent in to his solicitors. Application had been made to the defendant for payment, but refused, and the present action was instituted before it became statute barred.—Mr. Wm. L. Cranfield deposed that defendant personally gave him instructions with regard to the light. In October, 1892, the defendant told him not to proceed further with the matter; but witness worked at it until December of that year. Part of the amount charged was for the preparation of plans which it was found impossible to get from the defendant's surveyor.—Mr. Wm. Dean, the defendant, denied that he had ever instructed the plaintiffs to do any work for him. They were engaged on behalf of the ground landlord. In regard to the ancient lights, he particularly asked the plaintiffs not to go to any expense in the matter. On a previous occasion, when in occupation of The Warrior, Deptford, he had to pay the landlord's surveyor a fee of 2 guineas on the occasion of some alterations being effected.—His Honour said he believed the plans were furnished, and the work in connection with the lights done, at the request of the defendant, and he gave a verdict for the plaintiffs in respect of the fee of 10 guineas, with costs. He refused to accept the evidence as to custom.

The church of St. Thomas à Becket, Bovey Tracey, has just received a new Litany desk, a memorial to the late Mrs. Southey. It is 15th-century Gothic in style, blending with the surroundings, and is wrought in English oak. It is from the studios of Messrs. Harry Hems and Sons, church workers, of Exeter.

PARLIAMENTARY NOTES.

The National Gallery.—Dr. Farquharson asked the Under Secretary for War, on Monday, when the long-promised removal of St. George's Barracks would take place; and whether in the mean time any steps were being taken to lessen the risk from fire by the close proximity of the canteen to the Turner Room of the National Gallery. Mr. Brodrick: The partial evacuation of St. George's Barracks will take place as soon as the barracks at Millbank are ready, and a portion of the building will then be handed over to the Office of Works. It is unlikely that this can take place before the end of next year. The canteen is at some distance from the National Gallery. There will be a space of 15ft. between the National Gallery and the barracks when the alterations have taken place.

Public Buildings Bill.—Mr. Akers-Douglas formally moved, on Monday, the second reading of the Public Buildings Expenses Bill, providing for the erection of War Office, Admiralty, Science and Art, and other public buildings in London, at an estimated cost of £2,500,000. Mr. Dillon moved, as an amendment, that the Bill be read a second time that day six months, he disapproving of the general financial character of the Bill. Sir F. Powell, as chairman of the Museums Committee, strongly supported the measure. Mr. Bryce called attention to the desirability of making provision in these new blocks of public buildings for a comprehensive library which should serve the needs of all the great departments, and which also, to some extent, might be made to serve the needs of the public. Nearly all their great public departments had got a more or less insufficient library. In Paris the Ministry of Justice had such a library as he had described, and it was found to be of great service by the public as well as by the department. The Congress at Washington had a similar library, but very much larger—corresponding, in fact, to the British Museum library. Mr. Herbert Gladstone supported the Bill as a practical and comprehensive scheme, on which he congratulated the First Commissioner of Works. He asked the right hon. gentleman to reconsider his proposal to intrust the design of the new buildings to an outside architect, with the view of seeing whether he could not employ Sir John Taylor to design the whole building, both outside and inside. If anybody wished to see specimens of Sir John Taylor's work, there were the new police-court in Bow-street, the new Bankruptcy Court buildings in Carey-street, and the last addition to the Record Office in Chancery-lane. Each of these buildings was admirably designed for its purpose, with an excellent external appearance. The new addition to the Record Office was one of the best and most handsome buildings erected in London in the last fifty years. Sir John Taylor would design buildings for the new front of Parliament-street which would be in harmony with the great surroundings, and he knew better than anybody the mistakes made by architects in previous buildings, and would not err in the same path. He urged that the new offices in Whitehall should not align with the Home Office, but should, if possible, be recessed a little. This would be better architecturally, and would give increased width to Parliament-street, which was desirable. Had any decision been come to as to the location of the police-station in King-street, and would the Civil Service Commissioners be moved from their present position? At South Kensington, he understood, the Science and Art Department would be housed on the east side of Exhibition-road; thus a considerable space would be set free. What would be the extent, and what was proposed to be done with it? Mr. Akers Douglas, replying on the discussion, said special attention had been called to the widening of Parliament-street. Three proposals were put before the committee last year. That of the Government was to make the width of Parliament-street the same as that of Whitehall; that of his right hon. friend opposite was to leave the whole space open; and that of the Royal Institute of British Architects was to diverge slightly from a parallel line so as to give increased effect to the existing Home Office. The committee came to the conclusion that they should maintain the parallel line. If they adopted the proposal put forward by his right hon. friend, and decided that Parliament-street was to be finished off by an obtuse angle, the architectural effect would be bad, and it would cost £108,500 more. The scheme put forward by the Royal Institute of British Architects would cost about £20,000 more than that of the Government. His attitude with regard to this question would be guided by the advice of the architect who carried out the building. They would not necessarily follow the exact line of the Home Office, and he should be prepared to recommend a sum slightly in excess of the estimate if it should be found desirable to do so for architectural purposes. As to the architect, his right hon. friend asked him to press Sir John Taylor to accept the appointment. No man had a higher opinion of Sir John Taylor's ability than he had. But he was afraid he would not be able to persuade Sir John to undertake at his time of life, and after his long service, so onerous a duty as that. He had been fortunate enough, however, to secure his services (which would be lost to the State this year) for another three years, in order to have the benefit of his assistance as assessor in carrying out the plans of these buildings, and he would have a very large discretion in their arrangement. The Government were also fortunate in securing as another assessor Mr. Aitchison, R.A., president of the Institute of British Architects. It had been arranged that the police-station in King-street should be moved to the building now occupied by the Civil Service Commission, Cannon-row. The Civil Service Commission would be removed to premises which had already been taken for them in Victoria-street. As to the scheme for the rearrangement of the buildings at South Kensington, he thought he had succeeded in finding a scheme by which the whole of the buildings required for science and art would be housed on the east side of Exhibition-road. When the committee inquired into this subject last year they came to the conclusion that the official residences were a source of danger from fire to the collections of art. When the buildings which the committee had condemned were taken down it was found that the Goverment had a very much larger space at their disposal than they had anticipated. They therefore decided to place the whole of the new buildings on the east side of the road, and in those buildings they would find accommodation for both the Science and Art Departments for many years to come. The existing buildings on the western side would still be retained. The right hon. member for Aberdeen had asked him whether they could find room for a comprehensive library for public departments, in which there should be a copy of every blue-book of this and of other countries. He was afraid the sites at their disposal would hardly provide for housing so large a collection. Ample space had been taken for the housing of the staff of the Education Department, and further room would be allowed for the expansion of the office. On a division, the second reading was carried by 202 votes to 19.——The Bill passed through Committee on Tuesday evening, when it gave rise to an animated discussion. It was again assailed by the Irish and Welsh members. Mr. Akers-Douglas and the Chancellor of the Exchequer gave conciliatory replies to both sections of members, and promised to consider any claims that might be brought before them. Mr. W. Redmond challenged a division on a reduction of the amount by a million, which he had moved, and was defeated by 294 to 31. The Bill at last got through the Committee stage without amendment, and on Wednesday it was read a third time, and will now go through its various stages in the House of Lords as speedily as possible.

Barracks at Shorncliffe.—Mr. Brodrick, in reply to Sir B. Edwards, said, on Friday: It is the intention of the Government to provide accommodation in permanent buildings at Shorncliffe for a cavalry regiment on the higher establishment, two battalions of infantry, three field batteries, a field company of engineers, and two companies of the Army Service Corps. The cavalry buildings are expected to be completed in 1899, and the others in 1900.

CHIPS.

A translation of Benvenuto Cellini's treatises on goldsmith's work and sculpture, by Mr. C. R. Ashbee, is about to be published by the Guild of Handicraft, Essex House, Bow.

On Saturday, the formal opening took place of the new Market Hall, recently constructed in Dockray-street, in the borough of Colne, Lancs. The building has cost altogether, with the land, the town's market ground, and the fish market, about £9,000.

The foundation-stone of the new workhouse infirmary for the Islington Board of Guardians was laid at Highgate-hill on March 24. Mr. Smith is the architect, and Messrs. Kirk and Randall, of Woolwich, are the contractors. The cost will be about £250,000.

Two additional bells, to complete the peal of eight, are to be placed in the tower of St. Paul's Church, Walkden, together with a stained-glass window in the north aisle, during the coming summer, when the jubilee of the church will be celebrated.

A bronze statue of the Queen, intended for erection at Kingwilliamstown, South Africa, is now being cast at the foundry of Messrs. Hollingshed and Burton, Thames Ditton. It is a replica of the marble statue of her Majesty, executed in 1887 by the Queen's private sculptor, Mr. F. J. Williamson, of Esher, which now stands in the examination hall of the Royal College of Physicians on the Thames Embankment. A second statue, on similar lines, is also being executed in marble by the same artist at his studio at Esher, and will be erected at Londonderry; while a third copy, with modifications, is being prepared for reproduction in bronze, and is intended to be set up at Auckland, New Zealand.

Our Office Table.

The council of the Royal Institute of British Architects are determined to heap every honour in their bestowal upon their president. Not content with nominating Professor Aitchison as the recipient for the Royal Gold Medal for 1898, they have decided to recommend his election for a third year of office as president—a proposal which directly contravenes By-law 26, made under that Royal Charter which, when it suits their purposes, it is declared to be impossible to infringe in any particular. A private business meeting of members of the Institute is convened for Monday evening next at 8, to receive and consider the council's recommendation, and if this be adopted to take the first steps, under By-law 33, to suspend By-law 26, which declares that "No president who has filled the office for two successive years shall be again eligible for the presidency until the expiration of two years from the termination of his term of office." The recommendation will doubtless be agreed to *nem con.*, but it suggests a singular lack in the Institute of members qualified to occupy the chair.

A memorial signed by many of the leading architects, painters, and sculptors of the day appears in Wednesday's *Times*, expressing the anxiety of the writers that the great building schemes proposed by the Government should result in something that would worthily represent the architectural ability of the country. The signatories state that they have heard with dismay the utterances in Parliament of the First Commissioner of Works and the leader of the Opposition, whose disparaging criticism of Mr. Norman Shaw's New Scotland Yard seems to render it almost hopeless to expect anything from the present scheme but another architectural failure. The artists desire to place on record their admiration of Mr. Shaw's building, and their opinion that of the public buildings erected by Government in London during the present generation it is the one of which London may be most justly proud. The memorialists include Messrs. T. G. Jackson, R.A., L. Alma Tadema, R.A., Sir Arthur W. Blomfield, A.R.A., W. Butterfield, F.S.A., E. Onslow Ford, R.A., John Belcher, Thos. Brock, R.A., Philip Webb, John S. Sargent, R.A., W. R. Lethaby, Hamo Thornycroft, R.A., Walter Cave, Walter Crane, John F. Bentley, George Frampton, A.R.A., H. H. Armstead, R.A., J. C. Horsley, R.A., Frank Dicksee, R.A., Val. C. Prinsep, R.A., G. H. Boughton, R.A., Ernest Crofts, R.A., J. MacWhirter, R.A., Briton Rivière, R.A., Walter W. Ouless, R.A., Ernest George, John Fulleylove, R.I., J. T. Micklethwaite, Philip Norman, Halsey Ricardo, and Basil Champneys.

Repairs and improvements have been in progress the last few months at Anne Hathaway's cottage at Shottery, near Stratford-on-Avon, and have just been completed. The trustees have not attempted a "restoration" in the modern acceptance of the term. All the window casements were in a dangerous state. The woodwork was rotten, and the old glass and leadwork were falling out. Several of the plaster panels between the timber-framing were on the point of collapse, and some of the main timbers were found to be decayed in places. The old windows and casements have been repaired. English oak frames and mullions have been put in, and the ancient glass has been put back in diamond-shaped leaded lights. The timbers have been renewed where necessary, sound oak, taken from ancient buildings in Stratford, being used. Two old windows hidden beneath the plaster were discovered and opened up, and oak panelling that has been removed at different periods has been restored to its original position. The beams have been scraped of the whitewash which had covered them for generations, and cleaned and oiled, and the several rooms made more interesting by disclosing once more various old characteristics of the building. The old-fashioned "dog-grate" of the living-room was found at the bottom of the old bacon cupboard, where it had remained about fifty years.

At the Society of Arts on Tuesday night, Sir Edward Maunde Thompson read a paper on "English Art in Illuminated Manuscripts." The lecturer observed that the knowledge of the history of art that was to be gathered from a study of the illuminated manuscripts of the Middle Ages would be more generally appreciated if such manuscripts were more numerous than they are. Although they had survived in fairly large numbers, yet, in the ordinary nature of things, such portable relics, easily passing from hand to hand, must always have been liable to injury and loss. In our own day they were to be found in any numbers only in the national libraries or in the possession of a very few private collectors. The illuminated manuscript from its very shape had had an advantage which could scarcely be overrated for preserving the paintings and ornaments with which it was adorned—an advantage denied to the picture which hung upon the wall exposed to the light day by day and year by year. The earliest examples of illuminated manuscripts produced in England proved the existence of two distinct schools, differing essentially from one another, the one holding sway in the north, the other in the south, the one excelling in ornament, the other striving at a higher form of art and developing a remarkable power in figure-drawing. Both were imported, the Northern style being Celtic in its origin, and the Southern being introduced into the country without doubt by the Roman missionaries. The lecturer traced the development of the illuminated manuscript, referring especially to the Lindisfarne, Canterbury, and Winchester schools, fully describing some of the most interesting manuscripts now in existence. He observed that the political changes through which England had passed had surely left their mark upon the artistic productions, as they did upon the characters of the people; and as they moved from century to century they traced the hand of the Celt, the Roman, the Saxon, and the Norman as clearly in manuscripts as in the architecture of cathedrals and the remains of ancient sites. The wars with France and the convulsions of the War of the Roses seemed to have extinguished the last efforts of native artists, and henceforward the influence of the French style became so predominant that in the latter part of the 15th century the English art of illumination was practically dead.

The comparative cost of gas and electricity as sources of light, heat, and power was the subject of a paper read before the Royal Scottish Society of Arts at George-street, Edinburgh, on Monday evening, by Mr. C. K. Grieve. Rather exaggerated claims had, the lecturer said, been made on behalf of electricity since the date of its introduction. Both systems had their proper sphere, and, apart from the question of cost, that was likely to continue. For the purposes of the lecture the hall was fitted up with incandescent gas lamps, and an inquiry into the cost of the two illuminants showed that lighting by electricity cost four times as much as lighting by these lamps. Heating by electricity was, he said, much more expensive than heating by gas. Comparing gas-engines with electric motors, it might be said that in regard to convenience they were equal, but the cost per horse-power was considerably greater for the electric meter than for the gas-engine. Bailie Mackenzie said that he had not heard that part of the paper which dealt with the question of light, but in regard to motive power his opinion was that for all practical purposes, if the cost of the electric current was reduced to 1½d. per Board of Trade unit, as he hoped it would be in Edinburgh, it would be quite as cheap as Edinburgh gas at 3s., or as it would shortly be, 3s. 2d. His conclusion was that electric light at 4½d. per unit was just about the same price as gas at 3s. per thousand feet, and it was admitted all over that electric light at 4d. was as cheap, if not cheaper, than gas at 3s.

A new volume of photographic illustrations has been issued by Messrs. Aldam Heaton and Co., of Bloomsbury-street, W.C., giving a large number of executed designs in stencils for wall and frieze decoration, a variety of glass patterns for quarry windows, as well as figure-work for houses and churches. There are also a lot of chimney-pieces and furniture designs, curtains, and some ceilings. Colour, in not a few of these productions, form their essential characteristic, and in monotone printing, of course, the colour is left to the imagination; but for form and detail these collotype prints are unexceptional, and there is no risk of misrepresentation by tricky draughtsmanship. As we are personally acquainted with many of the designs chosen for illustration, we can speak highly of their excellence and good taste. They are as refined in idea as they are commendable in execution—new, without vulgarity.

In connection with the great city improvement made by the corporation of Edinburgh in the rebuilding of the North Bridge and the widening of North Bridge-street, an important sale took place on Wednesday of the areas on each side of North Bridge-street, recently acquired by the corporation. The whole of the west side of North Bridge-street, from the bridge to High-street, with a frontage of 350ft. and a depth of about 130ft., was exposed for sale in one let at £120,000, and was purchased at that figure by the proprietors of the *Scotsman* newspaper. It is the intention of the purchasers to erect on the principal portion of the site, which faces Prince's-street, extensive offices for the accommodation of all departments of the *Scotsman*. A block on the east side of the street was sold to the Commercial Bank for £35,000, while two remaining blocks, on the same side, did not find a purchaser.

A pamphlet is being issued by the National Hardware Association, 1, Creed-lane, Ludgate Hill, entitled "Ironmongers and the Plumbers' Registration Bill," warning ironmongers that their interests are seriously threatened by the Bill now before Parliament. It is stated that the system of registration begun some time ago by the Plumbers' Company was the beginning of a scheme which may exclude ironmongers from plumbing work. While the present Bill is intended to strengthen the hands of plumbers in their demands, there is not, it is claimed, a single provision in it which will secure that better work is done. A number of amendments are suggested. Among them there are the following:—That members of the proposed general council which is to make by-laws shall include eight ironmongers, since the representation of master plumbers and operative plumbers is specially provided for; that firms as well as individuals shall be registered; and that every ironmonger who employs capable ironmongers shall be put on the "authorised list." But the best course, it is urged, would be to destroy the Bill altogether.

CHIPS.

The partnership hitherto subsisting between W. Matthews and W. L. Lawrance, surveyors, Delahay-street, Westminster, under the style of Matthews and Lawrance, has been dissolved.

Mr. Robert H. Bicknell, L.G.B. inspector, has held an inquiry at Norwich into an application by the city council to borrow £13,500 for works of sewerage, and a sum not exceeding £4,900 for the purchase of premises for the extension and improvement of the provision market.

The Dean of Winchester has received an offer from Mr. Boyd, of Sillwood, Winchester, to defray the cost, amounting to over £200, of an addition to the recently reconstructed organ in the cathedral of the great 32ft. reed pedal stop.

The old irregular cricket pavilion at Kennington Oval is being replaced, at a cost of over £30,000, by a new structure. It is of red bricks, with Bath stone dressings, and has a frontage of 300ft. The building is to be finished early in May, in time for the opening match of the season. Messrs. Foster and Dicksee, of Rugby, are the contractors.

In the case of Samuel T. Harvey, of Queen Victoria-street, E.C., surveyor and builder, the bankrupt's discharge has been suspended for three weeks, ended March, 24, 1898.

An appeal is being made for £1,000 for the restoration of the ancient tower of St. John de Sepulchre at Norwich. It is situated in Ber-street, and, with one exception, rises to the highest point in the city, but is badly cracked from summit to base, and two of the five bells are broken.

The services rendered by Sir Thomas Roe to Derby were recognised on Wednesday evening by the presentation to him of his portrait, painted by Mr. J. F. Shannon, A.R.A. Sir Thomas asked the mayor to accept the portrait on behalf of the town.

Mr. C. T. Ritchie, M.P., visited Croydon on Wednesday, and performed the ceremony of opening some cottage homes, which have been erected by the board of guardians at a cost of £7,080, for the accommodation of pauper children of the union.

An extensive piece of ground on the West Hoe estate at Plymouth has been secured by a powerful syndicate as a site for a large new up-to-date hotel, with winter garden and opera-house. The ground has for some time been fenced in. The work of clearing and levelling the ground has been begun, and the erection of the buildings will be commenced forthwith. The work has been intrusted to Messrs. Kirk and Randall, contractors, of Woolwich.

The urban district council of Ashford, East Kent, have voted a gratuity of £100 to their surveyor, Mr. Terrill, in recognition of his services in connection with the new reservoir.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Society of Engineers. 7.30 p.m.
Royal Institute of British Architects. "Artistic Copyright," by M Georges Harmand, Avocat à la Cour d'Appel, Paris. 8 p.m.
Liverpool Architectural Society. "The Royal Insurance Buildings, Liverpool," by J. F. Doyle, F.R.I.B.A.

CHIPS.

The town council of Hastings have raised the salary of their borough surveyor to £800 a year.

The Bishop of London opened, on Wednesday week, the new schools which have been erected at Kingswood-road, Fulham, by the London School Board.

An hotel is about to be built on Saunders Hill, Padstow, from plans by Messrs. Crickmay and Sons, of Westminster and Weymouth.

Saturday afternoon saw the formal opening of the New Marine Park at New Brighton, recently acquired by the Wallasey Urban District Council. The park is situate opposite the Convalescent Home, and adjoins the shore. In area it covers 16,540 yards, and was purchased at 5s. per yard, the total cost being £4,135. Besides the sums spent on road-making, the laying-out and inclosing of the plot cost £6,235, making the total cost £10,370. The work has been carried out by Mr. W. H. Travers, the engineer to the urban district council.

Some notes on the life of timber bridges were contributed by Mr. E. S. Meloy to a discussion on "Wooden Piles and Bridges" at a meeting of the employés of the Bridge and Building Department of the Chicago, Milwaukee, and St. Paul Railway. From the records of over 100 miles of wooden bridges, Mr. Meloy concludes that the life of the floors in pile bridges is from 7 to 11 years, the average being 9 years 1 month. Howe truss bridges have a very similar span of life, the average age at which renewal was effected being 9 years 6 months. The wooden floors of iron bridges were longer lived, the average age at renewal with them being 10 years 2 months. Wooden bridges required inspection twice a year.

The committee of the Co-operative Wholesale Society, Limited, have selected from 168 candidates Mr. A. A. Blackburn, of Dewsbury, for the position of electrical engineer of their large works near Manchester.

Mr. James Holme, estate agent, Wesminster-buildings, Crosshall-street, Liverpool, was on Saturday morning found dead in bed at his residence, 10, Huskisson-street. Mr. Holme, who was 59 years of age, had for some time suffered from heart disease, and his general state of health had given his friends some concern. The deceased's father, James Holme, was chief magistrate of Liverpool in 1857-58, and his uncle, Samuel Holme, in 1852-53.

The Local Government Board has sanctioned a loan of £3,510 for the improvement of footpaths at Falmouth.

An outbreak of fire occurred on Saturday in a sawmill and woodyard on the St. Fort estate, in Fifeshire, where the whole erections and stock of cut wood were destroyed, the damage being estimated at £1,000.

A design for an altar rail in bronze, prepared by Sir Arthur W. Blomfield, A.R.A., has been adopted by the Dean and Chapter of Canterbury as part of the scheme of restoration for the cathedral. It is also in contemplation to restore the figure of the Archangel St. Michael, from which the Bell Harry Tower—the Angel Tower of olden days—derived its name. It was destroyed by the Puritans about the year 1500.

The almshouses under the management of the Coopers' Company, situated in School House-lane, Ratcliff, are shortly to be pulled down, as the site is required for the erection of modern buildings. The inmates will in future receive pensions and reside with their friends. Several of the houses have been empty for some time, and last week the 13 remaining occupants removed their furniture to their new homes, and bade farewell to the old quarters. The old buildings, which were built over 100 years ago, after a fire which occurred on the spot, are to be immediately demolished.

Trade News.

WAGES MOVEMENTS.

Greenock.—The Greenock and district plumbers have demanded an increase from 8½d. to 9d. per hour. A further request for a winter wage of 10d. per hour they are willing to withdraw, but they threaten to strike if their demand for increase to 9d. is not complied with by Friday.

Manchester.—At a meeting of the rivers committee of the Manchester Corporation on Monday, a letter was read from the Local Government Board in which that authority refuses to sanction the committee's scheme for dealing with the sewage effluent by what is known as the bacteriological system, unless the corporation will undertake to acquire 200 acres of land on which to carry out the system. It was resolved to hold a special meeting of the committee to consider the situation.

Northumberland.—The strike in the Blyth painting trade has been settled, an amicable arrangement having been arrived at between the employers and workmen over the question of apprentices, which was the chief point in dispute. The strike began on the 16th March.

A project is on foot for a direct railway from Thun to Brieg, in the Canton Valais, viâ the Loetschberg. For the purposes of this line a main tunnel will have to be pierced over seven miles in length, and over 4,000ft. above the sea-level, the cost of construction being estimated at £1,500,000 sterling.

On Saturday afternoon the memorial-stone of a new Masonic temple in connection with Stevenston Thistle and Rose Lodge, No. 169, was laid by Mr. Hugh R. Wallace, of Busbie, Provincial Grand Master of Ayrshire. The new Masonic temple is situated in New-street, Stevenston, adjoining the present Lodge premises, and is erected from plans prepared by Mr. John Armour, architect, Irvine.

The promoters of the Folkestone District Light Railways do not intend to proceed with the application to the Commissioners for the order for the construction of the proposed railways in Folkestone, Sandgate, and Hythe.

Brocklesby Hall, the seat of Lord Yarborough, near Grimsby, was the scene on Sunday morning of a serious fire, by which the whole of the north-east portion of the building, including the library and a number of bedrooms, was destroyed. Many valued heirlooms and manuscripts were destroyed. The damage is estimated at £20,000.

The town council of Richmond, Yorks, have decided to build a farmhouse and buildings on the estate of 201 acres at Aislebeck, from plans by their borough surveyor, Mr. Wetherell. The estate, which has hitherto been leased, will be managed for the corporation as a dairy farm.

The town council of Brighton have under consideration the amendment of the building by-laws, the chief proposal being to reduce the stringency of the requirements as to the height and thickness of walls.

The corporation of Stoke-on-Trent inaugurated at their gasworks on Wednesday week a new gasometer, which has been built for the corporation at a cost of £7,000 by Messrs. W. C. Holmes and Co., of Huddersfield. The new gasometer will hold 430,000ft. of gas, and meets a 30-hours' maximum demand. It is on the telescopic principle, with three lifts, and has a steel tank 25ft. deep by 90ft. in diameter, which will contain a million gallons of water.

On behalf of the Local Government Board, Mr. W. W. E. Fletcher concluded, on Friday, an inquiry into the application of the Withington Urban District Council for power to borrow a sum of £5,500 for the purchase of land on which to erect an infectious diseases hospital.

Colonel A. J. Hepper, D.S.O., R.E., an inspector of the Local Government Board, held an inquiry at Widnes Town-hall on Friday into an application of the town council for sanction to borrow £3,850 for works of sewerage. The town clerk, Mr. Oppenheim, said the money was required to construct a new sewer in place of the central outfall sewer, which was the oldest sewer in the borough. Mr. J. Sinclair, the surveyor, gave evidence as to the need of the new sewer, and produced reports and plans.

A Local Government Board inquiry was held at Radcliffe, Lancs, on Friday, by Mr. Sandforth Fawcett with regard to an application of the Radcliffe District Council for powers to borrow £2,000 for works of surface drainage. It is proposed to replace the old-fashioned brick eyes, which are stated to be very insanitary, with stoneware trapped gullies. Powers to borrow upwards of £30,000 for sewers and sewage works have already been obtained.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2257.

FRIDAY, APRIL 8, 1898.

WORKMEN'S COMPENSATION AND EMPLOYERS' LIABILITY.

WE have already referred briefly to the provisions of this momentous Act, which comes into operation on the 1st of July next. As many of our readers are concerned with the new Act, it is important that they should make themselves acquainted with the requirements of the new law, whether as employers who will have to reconsider their position and their liability to make provision for any of their workmen, or as workmen who will be much benefited by the Act, and who will be anxious to find out their rights and their mode of action. The Act will certainly add considerably to the responsibility of the employer, for he will be liable to pay damages or compensation for personal injuries that have not been caused by any negligence on his part. The long and short of it is that the Act compels every employer who comes within the scope of the law to insure all his servants against injury.

Mr. W. Ellis Hill, M.A., in his comprehensive volume,* which will be found of great use as a guide to the new Act as well as to the Employers' Liability Act, 1880, and the Factory and Workshop Act, 1878 to 1895, points out the leading object of the new legislation which is to soon come into operation. The burden of personal injury caused by accident during employment has, it will be admitted, been chiefly borne by the unfortunate workman himself according to common law. The Employers' Liability Act, 1880, happily altered this state of things, and so did the Factory and Workshop Acts, but they still left it impossible in some cases for the injured man to recover compensation from his employer. The Act which we are considering is intended to place the workman in a more satisfactory position, and make the employer responsible for any injury caused by his negligence, or by that of any person in his employ. In his introduction Mr. Hill observes: "It is difficult to see how any negligence on the part of an individual, and yet of an impersonal character, can exist. If a man is negligent, it would appear that he is guilty of negligence personal to himself, and therefore it may be taken that the law existing before the coming into force of that statute is left unaffected. Under the Act, however, the workman is given the right to proceed either under the law existing before the coming into operation of the Act, or, at his option, to take advantage of the provisions of the statute." The amount of compensation is the main thing, and therefore the workman will have to consider which course is the best for him to adopt.

At common law the workman had a right of action against his employer for any injury he sustained through personal negligence, and under the Employers' Liability Act he could recover damages for injuries sustained through negligence of any persons for whom the employer was answerable. The workman or claimant for compensation had to prove negligence on the part of employer, and that such negligence was the direct cause of the injury; but it was generally difficult to prove these two things—it was difficult to say what the duty was, or how much. The contract, express or implied, had to be considered before the duty of the master could be found; so that, as a consequence, when a workman was injured at his work by the negligence of those employed by the same master, he could not recover if a contract of employment existed. That he suffered by the negligence of some workman in the same grade as himself was no doubt often the case. Yet it was hard, too; for the injured man might know that his comrades were working dangerously, but he did not like to complain to the employer or foreman of the fact. The Employers' Liability Act so far altered this relation as to make it more satisfactory to the workman. The effect was to throw a responsibility on the master for the injuries sustained through the negligence of men in his employ who were foremen or superiors of the injured man, and who, therefore, did not like to complain.

Mr. Ellis Hill deals with the liability of the employer under this and other Acts; but we mainly now treat of his liability under the Workmen's Compensation Act of 1897. By this Act a new principle has been introduced. It casts upon the employer a new statutory liability for injury, without reference to any duty or negligence on his part or those for whom he is responsible. This liability is confined to certain persons and employments to which the Act applies—namely, to employment on, in, or about a railway, factory, mine, quarry, or engineering work, "and to employment by the undertakers on, in, or about any building which exceeds 30ft. in height, and is either being constructed or repaired by means of a scaffolding, or being demolished, or on which machinery driven by steam, water, or other mechanical power is being used for the purpose of the construction, repair, or demolition thereof." The liability is imposed on the employer even when the accident is caused by the negligence of the workman himself, if the latter has not been guilty of serious and wilful misconduct. The compensation is small in cases of mere injury, but when death ensues it is substantial. The first schedule gives the scale and conditions of compensation. The amount is to be, where death results, if the workman leaves any "dependants wholly dependent upon his earnings at the time of death, a sum equal to his earnings in the employment of the same employer during the three years next preceding the injury, or the sum of £150, whichever of those sums is the larger, but not exceeding in any case £300, provided that the amount of any weekly payment made under this Act shall be deducted from such sum, and if the period of the workman's employment by the said employer has been less than the said three years, then the amount of his earnings during the said three years shall be deemed to be 156 times his average weekly earnings during the period of his actual employment under the employer." If the workman leaves any dependants in part dependent upon his earnings, such sum not exceeding the sum payable under the foregoing provision as may be agreed upon on arbitration; and if he leaves no dependants, the expenses of his medical attendance and burial, not exceeding £10. In cases of total or partial incapacity for work, a weekly payment after the second week not exceeding 50 per cent. of his average weekly earnings during the previous 12 months if he has been so long employed, or, if not so long, a weekly allowance not exceeding £1.

Other conditions are given. It is remarked, as to the compensation for personal injury, that it is so small, and the chances of injury so infrequent, that the most economical course to meet such cases would be to insure against accidents.

Confining our attention to building accidents, it will be frankly admitted that the Act makes an arbitrary limitation as to the height of building, for unless it is over 30ft. in height, the trade does not come within the operation of the Act. This limit is borrowed from the Factory and Workshop Act, 1895; so that if personal injury is sustained by a workman on or in a building which is, say, 29ft. high, there is no compensation. But there is no guide for the determination of the height; how is it to be determined? No definition is given. This is a question which will give rise to much difference of opinion. Those who framed the Act were only thinking of the risk incurred by the use of high scaffolding, building cranes, and other appliances. Should an accident occur and personal injury or death result in or near a building over the statutory height without scaffolding or machinery, the Act is inoperative. Under the head of demolition, the Act applies to any building being demolished over 30ft. in height, although no scaffolding or machinery is used.

Sub-contracting introduces another point. To prevent the evasion of liability, section 4 provides that the undertaker or head contractor is to pay compensation whenever the contractor is liable to pay it to the injured workmen, or whenever the contractor would be liable if he were an employer. The section goes on: "Provided that the undertakers shall be entitled to be indemnified by any other person who would have been liable independently of this section." A right is there given to the undertakers to recover what they have been obliged to pay to the injured man from any person who would have been liable independently of the section.

We have given here simply the broader features of the new Act, which has been so ably dealt with by Mr. Ellis-Hill. The decisions under the Employers' Liability Act collected in the appendix will be found to contain every important point likely to arise. All legal practitioners, employers, contractors, and others interested in the far-reaching powers of this Act ought to carefully study the sections and schedules. Insurance companies as well as employers are concerned with them to ascertain their liabilities, and the workmen also ought to know the privileges conferred by the Act, if only to arrange terms with their employers.

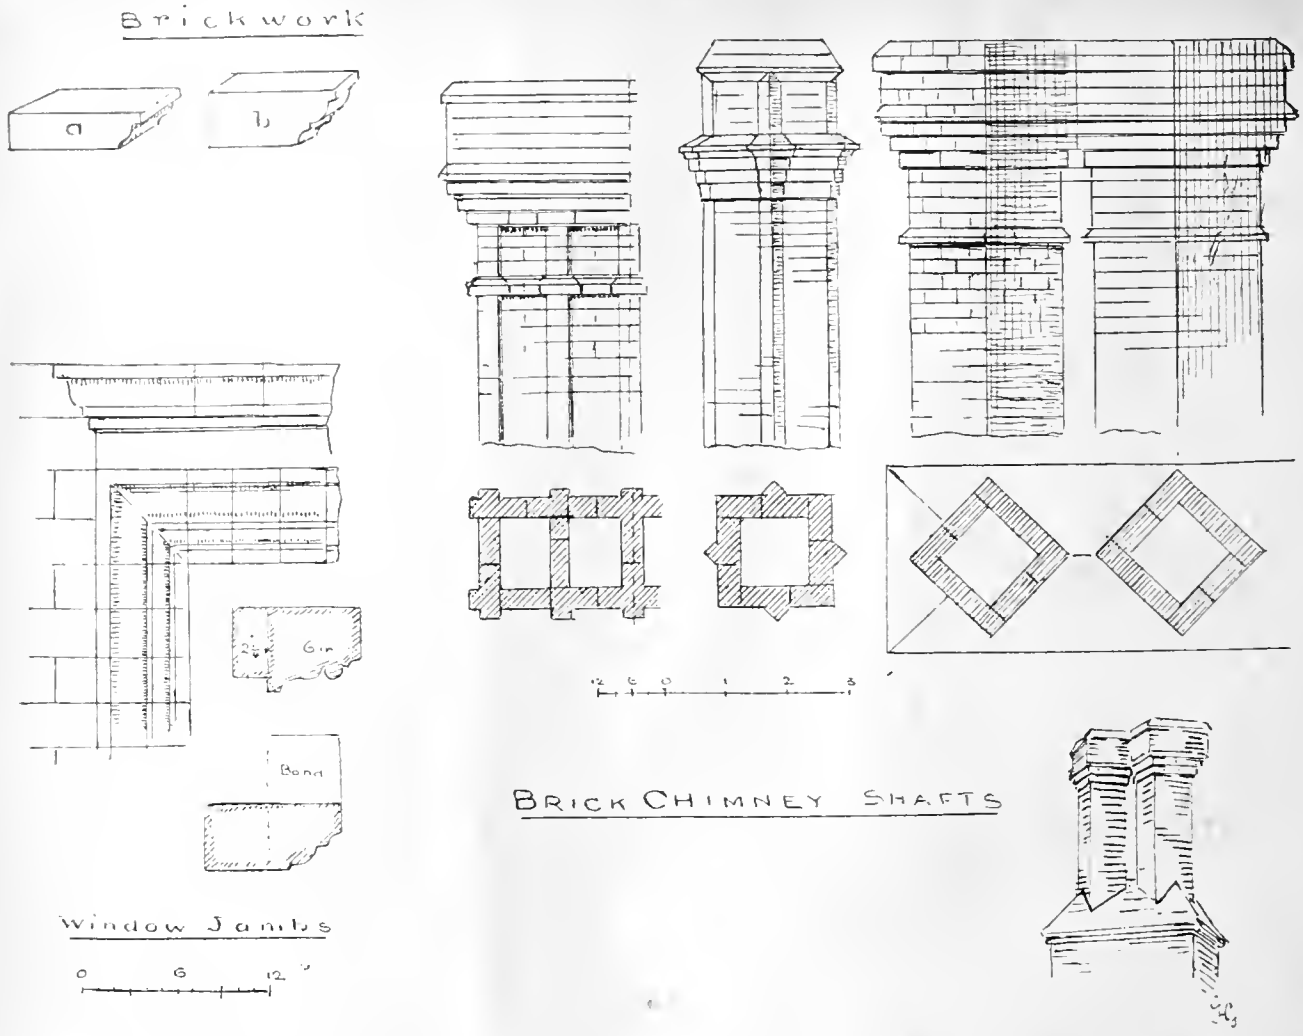
* The Law and Practice relating to Workmen's Compensation and Employers' Liability. By W. Ellis Hill, M.A., of the Inner Temple and Northern Circuit, Barrister-at-Law. London: Waterlow and Sons, Ltd., London Wall.

MODEL SPECIFICATIONS.—VII.

ORNAMENTAL BRICKWORK.

LAST week we made a few remarks on the subject of moulded and gauged brickwork, and we gave a few clauses for external facings, dressings, and pointing. The architect ought to make himself acquainted with the leading kinds of bricks or any local-made goods. For red-brick facings, the Fareham reds are best for weathering, and are of a nice, deep-red colour, and the Fareham "rubbers" for gauged work; there are also the "T. L. B." (Bracknell) red rubbers, and the harder gault bricks. "Picked stocks" are largely used for facings, also the "bright yellow stocks." The "Suffolk Whites" make good facings, and are suitable for gauged work. The best yellow malms and "seconds" are frequently specified. Then we have the Hartshill Brick and Tile Company (Messrs. Birks), Stoke-upon-Trent, as makers of first-grade bricks, tiles, terracotta, and paving bricks; while the excellent moulded bricks made by Mr. J. Brown, Whitechapel, furnish the architect with all the necessary materials for his ornamental brickwork.

We do not propose to enter into the subject of design; but many brick buildings show often a want of knowledge of certain rules of design. What is right in moulded work like terracotta is often undesirable in brickwork. For example, we sometimes see ornamental mouldings with sharp curves and angles which cannot be executed in cut or rubbed brick without much labour unless the bricks are specially moulded, as, for instance, a gable coping with two concave curves joining at an acute angle.



Not only are these ornamental details unpracticable, but they are not consistent with good brick design—even moulded work. There is a taste just now for these and other rococo vagaries in design. What is tolerable in carved stonework or terracotta work is contrary to the principles that should govern brick ornament. Carved brickwork, such as we see in tympana, panels, shields, friezes, &c., can only be regarded as carving in stone, the joints being kept very close and the bricks of a soft, easily-chiselled quality; but such ornament should always be subordinated to the design and confined to small surfaces. The sketches we give explain themselves. In the design of brick moulded work, such as cornices and stringcourses, the architect ought to decide whether the work should be headers or stretchers. It is necessary also to bear in mind that the moulding, if on one end of the brick, may be made in the thickness of brick 3in., or in the width 4½in., (shown in *a* and *b*). For arches and curved work these are necessary. Moulded bricks for jambs or architraves generally have the moulding placed as in *b*, so as to line with the courses; on the next stretcher course the moulding is run on part of the length of brick to form bond with the header course, as shown in the sketch of jamb bricks. These bricks can be had with wider mouldings than 4½, and specially-made bricks for the purpose can be ordered.

We also show one or two sketches for ornamental chimney-stacks, with members or narrow pilasters worked in the sides. Many different arrangements are possible with the use of these special-made bricks, and we show how the projecting pilasters are formed and the bond secured. In specifying chimneys, it is necessary to insist on such a clause as this: "Bond in the withes on every second course, and the use of bats to be avoided as far as practicable." The joints, too, should be well filled up with mortar and cement. In ornamental stacks, where there are a number of flues, as in large town buildings, terracotta flue-pipes (as those made by Messrs. Doulton) can be used, and to save space, Boyd's iron flue plates, which are ⅛in. thick and 12in. square, having tongued and grooved joints, may be employed.

We illustrate also a moulded brick window jamb and the brick bond, also a gabled doorhead and pilasters for a doorway in brick, in "gauged" work, executed with Fareham or T. L. B. "rubbers" set in putty. The tympanum of the gable is shown carved. The rubbers used are of even texture, and when there is deep carving, it is better to use all "headers," and grout the back in solidly with cement. Carved work is better set in a composition of whiting and patent stopping, or shellac, and the bricks may be put together in this cement before putting it in place for carving.

In brick buildings a great many details occur which are often inadequately described in general clauses, and the builder can only gather the intention of the architect by referring to the contract drawings to an eighth-of-an-inch or a quarter-inch scale, if there are no details supplied. The consequence is that they are misinterpreted, or the contractor, if honest, is more likely to err on his own side. Omission rather than excess is the rule. We mean with regard to such details as the execution of quoins and reveals of openings, brick cornices, stringcourses, chimney-top courses, gauged arches, panels, and other features. The results are: Bricks not moulded to the design of a cornice are put in, or the cornice is arranged out of ordinary bricks, the jointing is in mortar instead of cement, the arches and courses are not set in fine putty, or are not properly backed in cement. In many cases an inferior class of red "rubbers" are used. It should be the aim of the architect to write his clauses so as to prevent any of these things happening by specifying the exact kind of brick to be used; by showing by detail how it is to be cut and arranged with regard to other courses, to state the kind of cement joint and pointing, and other items.

Here follow a few clauses on jambs and reveals, gauged arches, brick cornices, and other details that usually occur:—

3. *Plinth.*—The plinth course to be formed in red Fareham (or moulded bricks of approved section), and to be 6in. or 9in. high, and project 2¼in. from the face of wall above, in cement mortar. Or—

The plinth to be formed as shown in detail of red moulded bricks (sections described), set in cement; it is to project 2¼in., and be of two courses. Or—

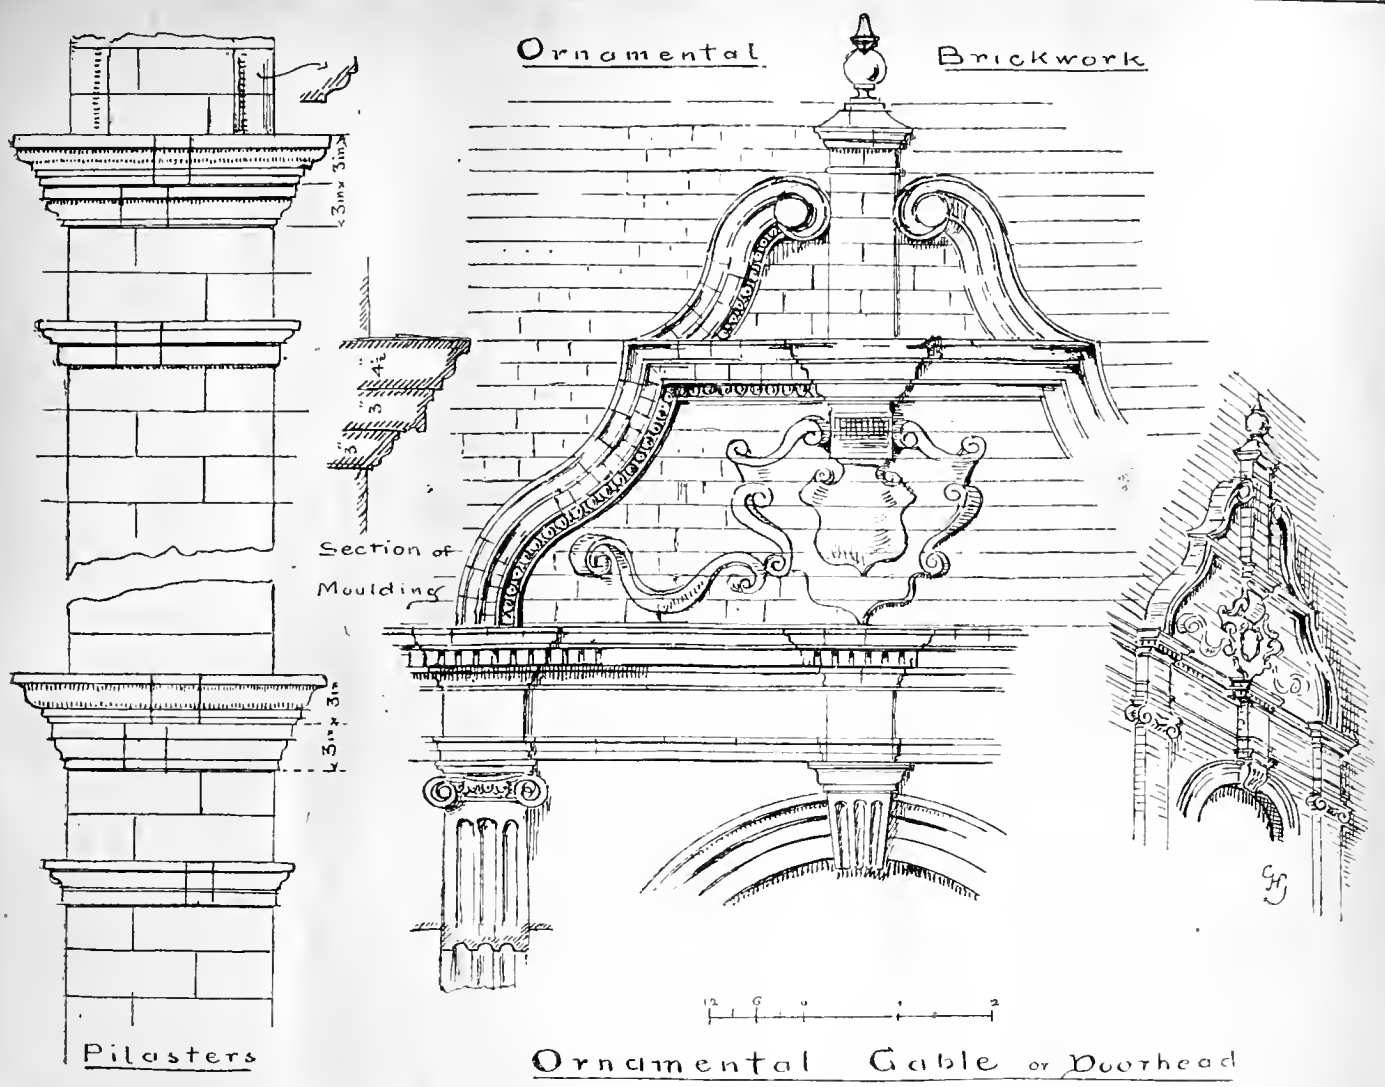
Form plinth course as shown in red moulded brick, projecting 2¼in. from face of main wall (or to be finished at top with blue Staffordshire brick splay). Set out bond for upper openings, and make a "perpend" for every reveal, and avoid "closers" in the internal angles where possible.

4. *Moulded Brick Architraves.*—The window and door architraves and reveals to be formed as shown in detail for margin with moulded bricks made by J. Brown (or R. M. Whiting, or other maker) of the section No. 278 or 281, with bond bricks, mitre to head, and stop in cement mortar (or set in fine putty). The moulded bricks are to be made a little thicker than ordinary bricks, and the beds and joints rubbed true; and before the scaffolding is struck, the work is to be rasped or rubbed, and all arrises made straight and true. Or—

The jambs to be executed in approved red moulded bricks in stretcher and header courses, as shown by detail, set in fine mortar (or cement), and point with a neat weather joint.

5. *Mullions, &c.*—The mullions, sills, heads, &c., of windows marked in elevation to be executed in cut and rubbed (or moulded bricks) of the shapes shown in margin, set in cement mortar with a neat joint. The work to be rasped and rubbed, and true arrises to be made before the scaffolding is struck. Or—

Carry up bay window (or porch) in accordance



with detail. The mullions to be built with special moulded bricks (name maker and number of section in catalogue if selected therefrom) with proper bond and with broken joints, with mitred corners and in cement mortar, worked as shown in detail.

6. *Gauged Arches.*—The external window and door openings to have carefully executed cut and gauged arches of red Fareham rubbers, or "T.L.B." red rubbers, or Suffolk whites, &c., with fine joints set in lime putty. Or—

Turn accurately, with a cambered soffit ½in. rise to the foot, cut and gauged arches in red "rubbers" (or best malms) over all openings 12in. deep, and set in lime putty (or raked out and pointed to match facings). (If joggled joints, state so; also if there are stone "keys," &c.)

7. *Stock Brick Arches.*—All other arches to be "axed" of red (or other) bricks, 9in. (or 14in.) deep, with a camber of 2in. or more (or to be segmental or circular) set in cement mortar.

8. *Brick Cornices.*—Form the cornice (state if the main, under eaves, or round chimneys) in cut rubbed and moulded red Fareham rubbers, with dentil or enrichment course as shown in detail with cement weathering (or put over top of cornices 5lb. lead weatherings, well wedged into brick joint).

9. *Ornamental Gauged Work Generally.*—The ornamental moulded gables and carved brickwork, shown in sketch above, to be executed to design, details for which will be supplied. The best Fareham red bricks and rubbers, or "T.L.B." rubbers of approved colour, are to be selected for this part of the work (or use the best Suffolks). The moulded projections to be of three (or more) courses of the sections shown, all headers (or as shown). The carved enriched portions or "key" blocks to arches to be put together before placing in position, set in putty (or shellac) for carving, and to be all headers. Well grout the back solidly with cement. The architect will furnish a design for the ornament, and the carving must be done to the architect's approval. The mouldings, cornices, and string-courses to be weathered with two courses of tiles, breaking joint set in cement, or to be covered with 5lb. lead well wedged into brickwork.

10. *Ornamental Gables.*—The copings of gables shown in elevation to be of red Fareham bricks of quality and make (or Lawrence's or Brown's moulded bricks, Nos. ———), in two or three courses, laid in cement mortar (gauged 2 to 1) and finished with a neat weather joint. Or—

Build the gables as shown in elevation and cope the same with the best hard burnt coping bricks or moulded bricks (name manufacturer), and of the sections shown in detail, in three (or more) projecting courses laid in cement mortar, finished with a neat weather joint, the moulded bricks to be rubbed and to form true arrises in straight lines and curves, the top course to be set and weathered in cement. Or—

Form the gables over entrance, &c., as shown in detail, in cut, rubbed, and moulded brick rubbers, of Fareham reds or "T.L.B." red rubbers (or purpose-made moulded bricks). The moulded bricks to be in three (or two or one), projecting and enriched courses, with headers, as shown, all to be properly cut and rubbed to form the curves, with proper mitres set in lime putty, the upper course to be set in cement, and to be covered with 5lb. lead weatherings well wedged into brickwork of wall behind.

This clause would be suitable for gable we illustrate in sketch.

SANITARY WORK.—IV.

LAWS AND BY-LAWS.

FROM time to time it has been found necessary to specifically define and enforce certain general sanitary measures in order to safeguard the interests of the public health. The more important of the statutes which relate to the various matters of public hygiene are as follows—viz.:—Public Health (Scotland) Act, 1867, 30 and 31 Vict. c. 101; Public Health (England and Wales) Act, 1875, 38 and 39 Vict. c. 55; Public Health (Ireland) Act, 1878, 41 and 42 Vict. c. 52; Public Health (Amendment) Act, 1890, 53 and 54 Vict. c. 59; Public Health (London) Act, 1891, 54 and 55 Vict. c. 76; Public Health (Water) Act, 1878, 41 and 42 Vict. c. 25; Factories and Workshops Act, 1878, 41 and 42 Vict. c. 16; Housing of Working Classes Act, 1890, 48 and 49 Vict. c. 72; Contagious Diseases (Animals) Act, 1878, 41 and 42 Vict. c. 74, as amended by the Contagious Diseases (Animals) Act, 1886, 49 and 50 Vict. c. 32; Contagious Diseases (Animals) Act, 1894, 57 and 58 Vict. c. 57; Infectious Diseases (Notification) Act, 1889, 52 and 53 Vict. c. 72; Infectious Diseases (Prevention) Act, 1890, 53 and 54 Vict. c. 34; Rivers Pollution Prevention Act, 1876, 39 and 40 Vic. c. 75; Metropolis Water Act, 1852, 15 and 16 Vict. c. 84; Metropolis Water Act, 1871, 34 and 35 Vict. c. 113; Metropolis Local Management Act, 1855, 18 and 19 Vict. c. 120; London Building Act, 1894, 57 and 58 Vict. c 213.

Of these, the Public Health Acts deal more particularly with the sanitary construction of buildings and their accessories.

Within the limits laid down by the respective Acts of Parliament, the different local sanitary authorities throughout the kingdom are empowered to make such regulations and by-laws as may be considered necessary for the proper drainage of houses. It is also provided that such by-laws must not be in any way repugnant to the laws of the country, and must have been previously confirmed by the Local Government Board. To assist sanitary authorities in framing suitable regulations, the Local Government Board have compiled a set of model by-laws for their guidance, and it is on these that most local by-laws are based.

It is now proposed to indicate the general sanitary conditions which are required in the Metropolis, so far as they relate to matters of ordinary house-drainage. These may be taken as fairly representative of what is absolutely necessary to secure satisfactory results.

Under the Public Health (London) Act, 1891, 54 and 55 Vict. c. 76, section 39, it is laid down that the *County Council* shall make by-laws with respect to "water-closets, earth-closets, privies,

ash-pits, cesspools, and receptacles for dung, and the proper accessories thereof in connection with buildings, whether constructed before or after the passing of this Act." Also that every *Sanitary Authority* shall make by-laws "with respect to the keeping of water-closets supplied with sufficient water for their effective action." The examination of house-drains and sanitary fittings, together with the enforcement of all by-laws relating to the same devolve upon the various sanitary authorities.

For the purpose of carrying into execution this Act, the *Metropolitan Sanitary Authorities* are the Commissioners of Sewers for the City, and for all other localities embraced within the Metropolis or administrative county of London, the respective vestries, district boards, local board of health, board of guardians, or overseers of the poor, as the case may be.

The following is a brief outline of the by-laws which have been made by the London County Council under section 39 (1) of the Public Health (London) Act, 1891, so far as they relate to ordinary house-drainage.

Clause 1 states that every water-closet shall have an external wall for one of its sides at least, whilst an earth-closet must have external walls to not less than two of its sides. A water-closet must not be entered directly from a living-room, larder, or workshop. The entrance to an earth-closet must be from the external air.

Clause 2 requires that every water-closet or earth closet shall have a window with an area of not less than 2 superficial feet. The window must be placed in an external wall so as to open directly into the external air. Means of ventilation must also be provided, consisting of at least one air brick built in an external wall.

Clause 3 directs that the closet water supply shall be kept quite distinct from that for drinking purposes. Adequate flushing apparatus to be provided to each closet, the flushing pipe being not less than 1¼in. in diameter. An efficient siphon trap, with water seal, to be fixed under the closet basin. The use of D traps is not permitted.

Where two or more water-closets discharge into the same soil pipe, an anti-siphonage pipe of not less than 2in. diameter must be provided to the closet traps, and ventilated into the open air at a point as high as the top of the soil pipe, or connected to the soil-pipe above the highest water-closet. The anti-siphonage pipe must be connected to the soil-pipe branch at a distance of not less than 3in. and not more than 12in. from the highest part of the trap on that side of the water-seal which is nearest to the soil-pipe.

Clause 4 states that for new buildings the soil-pipes are to be fixed outside. They must be not less than 3½in. diameter, and carried up full bore above the roof of the building. The open end of the soil-pipe to be provided with a wire guard, and, where practicable, to be not less than 3ft. above any window which may be within 20ft. of the same. The weights for lead and iron soil-pipes of different sizes are as follows—viz.:

Weights for Soil-Pipes.

Diameter.	Lead.—Weight per 10ft. length, not less than:	Iron.—Weight per 6ft. length, not less than:
3½in.	65lb.	48lb.
4in.	74lb.	54lb.
5in.	92lb.	69lb.
6in.	110lb.	84lb.

The connection between a lead trap or pipe and an iron soil-pipe or drain must be made with a brass thimble soldered to the lead pipe, the joint between the thimble and iron pipe or drain being run with molten lead and properly caulked. The junction between a stoneware trap or pipe and a lead soil-pipe must be made with a brass socket soldered to the lead pipe, the end of the stoneware trap or pipe being inserted into the socket and the joint made with Portland cement. In the case of stoneware and iron, the end of the stoneware trap or pipe is to be inserted into a socket on the iron pipe or drain and the joint made good with Portland cement. No soil-pipe must be connected with any rain-water pipe, bath waste, &c., nor shall there be any trap fixed between the soil-pipe and and the drain.

Clause 5 directs that any alteration made to an existing water-closet shall comply with the foregoing by-laws.

Clauses 6, 7, 8, 9, 10, 11, 12, and 13 refer entirely to the construction of earth-closets and privies.

Clause 14 requires that notice shall be given in writing to the clerk of the sanitary authority before carrying out works relating to the construction of waterclosets, earth-closets, privies, &c.

Clause 15 refers to the reconstruction of existing earth-closets and privies.

Clauses 16, 17, 18, and 19 deal with the provision of ash-pits in connection with buildings.

Clauses, 20, 21, 22, 23, 24, and 25 relate to the construction of cesspools and dung-pits.

Clauses 26 and 27 insist upon the efficient cleansing and maintenance of all waterclosets, earth-closets, privies, cesspools, &c.

Clause 28 states that for every offence against the foregoing by-laws, the offender shall be liable to a penalty of £5, and in the case of a continuing offence to a daily penalty of 40s. for each day after written notice of the offence from the sanitary authority.

In addition to the by-laws of the London County Council dealing with the construction of water-closets, earth-closets, cesspools, &c., in the manner already indicated, the various local sanitary authorities — as represented by the respective vestries, district boards, &c.—have issued further regulations respecting the construction of drains and their accessories. These local regulations vary in almost every district; but it is probable that one uniform set of regulations will shortly be enforced by the different Metropolitan sanitary authorities. Such a consolidation of local drainage regulations would undoubtedly be advantageous in every way.

The regulations made by the vestry of St. Martin-in-the-Fields under section 76 of the Metropolis Local Management Act, 1855, 18 and 19 Vic. c. 120, are now given in order to afford a typical indication of what is required by Metropolitan local sanitary authorities in the construction of house drainage. In this instance they are as follows—viz.:—

1. Seven days' notice of the intention to drain a house or building is to be given to the vestry. Forms of application can be obtained from the surveyor.

2. A second notice is required when the work has not been commenced within six months from the date of the application, and the sanction is given only to the person or persons making the application.

3. Such notice must be accompanied by a plan drawn to a scale of not less than 8ft. to an inch, accompanied by a block plan, showing the locality of the intended works, drawn to a scale of not less than 44ft. to an inch. The plan must show as much detail of the house or premises proposed to be drained as is necessary to enable a judgment to be formed as to the efficiency of the intended drainage. It must also show the position of all water-closets, sinks, bath wastes, &c., the lines of new drains with the sizes thereof to be shown in red, and any existing drains in blue upon the plan.

4. All horizontal pipes from water-closets shall have an internal diameter of 6in. if of stoneware, and an internal diameter of 5in. if of iron. For the drainage from areas, sinks, and subsidiary drains, 4in. pipes may be used.

5. The whole of the available fall is to be made use of, and no drain to have a less fall than 1 in 40. In any case, however, where a gradient of less than 1 in 40 cannot be avoided, special provision shall be made for an automatic flushing of the drains by the adoption of an approved flushing siphon.

6. Each house or building shall have a separate drain in connection with the sewer, and no drain shall be laid under any house or building, should it be practicable to lay them outside of same.

7. The drains shall be laid in direct lines between the points of inspection wherever possible.

8. The drains of all houses and buildings shall consist of glazed stoneware pipes, or of cast-iron coated with Dr. Angus Smith's bituminous rust-prevention composition inside and out.

9. All pipes must be laid with watertight joints upon cement concrete, and where they pass underneath buildings they must, if of stoneware, be surrounded with not less than 6in. of cement concrete in the proportions of one part of clean sharp sand, five parts of clean ballast, and one part of Portland cement—all by measure. Where the covering of pipes underneath any building is less than 1ft., iron pipes shall be used with lead and gaskin joints.

10. The connection with the street sewer will be made by the vestry at the owner's expense, including so much of the work as will be beneath the public-way, and upon the estimated amount of same being paid by the applicant to the surveyor to the vestry.

11. No drain shall be laid on the premises until the drain from the sewer to the premises has been laid in accordance with the above regulation.

12. For the effectual ventilation of the drains at least two untrapped openings shall be provided. (*a*) One opening being at or near the level of the surface of the ground adjoining; such opening shall communicate with the drains by means of a suitable pipe, shaft, or disconnecting chamber, as near as practicable to the trap, which shall be provided between the main drain of the building and the sewer with which such drain communicates. Such opening shall be situate on that side of the trap nearer the building. (*b*) The second opening shall be obtained by carrying up from the point or head of the drains farthest distant from the first-mentioned opening, a vertical pipe or shaft to such a height, and in such a manner as effectually to prevent any escape of foul air from such pipe or shaft into any building in the vicinity thereof.

13. A suitable trap to be provided in every main drain which directly communicates with the sewer at a point as distant as may be practicable from the building, within the curtilage thereof, and as near as may be practicable to the point at which such drain may be connected with the sewer.

14. Immediately above the disconnecting trap a suitable inspection chamber shall be constructed, provided with an air-tight cover.

15. Junctions of branch drains shall in no case be made at right angles, but with proper junction pipes, having the branch pipe formed on them at an angle of 45° to 60° with the main drain in the direction of its flow; no cutting of pipes will be sanctioned, and no vertical right-angle junctions will be allowed except as inspection shafts, or for ventilation purposes.

16. Rainwater pipes, bath-wastes, and all wastes from sinks, hydraulic lifts, or other business appliances shall deliver outside the building on to open trapped gullies, or, if they must of necessity be within the building, on to special interceptors approved by the vestry, which must in every case be connected to the drains, and all inlets to the drains shall be properly trapped, except those inlets used for the purpose of ventilation. "Bell" traps will on no account be allowed.

17. Soil-pipes placed vertically shall be of, at least, 7lb. lead. They shall be of an internal diameter of 4in., and placed, wherever practicable, outside the house or building, and in every case extended full-bore up to and above the eaves, finished with an approved cowl, at such a height as effectually to prevent any escape of foul air into any building in the vicinity thereof. The connection between the water-closet and the soil-pipe and ventilating pipe shall be of lead. Soil-pipes are not to be used as rainwater pipes.

18. The principle of construction of all water-closets is subject to the approval of the vestry. "D" traps, containers, receivers, and hopper-shaped pans cannot be permitted. Where a series of water-closets are placed one above the other, delivering into a common soil-pipe, the traps of each closet-basin must be specially ventilated to prevent siphonage by means of a 2in. lead pipe turned into the main ventilation pipe.

19. No rain-water will be allowed to deliver on to the footways or roadways; water from the roofs, bay windows, cornices, &c., must be taken into the system of house-drainage.

20. Overflow-pipes from all cisterns, service-boxes, "safes," &c., must discharge, if practicable, direct into the open air, or be carried by means of lead or other suitable pipes, to a proper trapped gully or siphon.

21. The whole of any system of drainage must be approved by the surveyor before a single pipe is covered up, and the joints tested by charging with water or other means, should the surveyor so direct.

Note.—Under the Metropolis Management Acts persons are liable to the following penalties—viz., £10 for making drains contrary to the directions or regulations of the vestry. £50 for making drain contrary to the order of the vestry, and drain cut off from the sewer. £20 for building or encroaching on any sewer. £20 for interfering with any sewer without a license.

The by-laws of the London County Council, made under section 39 (1) of the Public Health (London) Act, 1891, and dated 28th June, 1893, are enforced by the sanitary authority.

A careful consideration of the by-laws and

regulations which usually obtain with regard to house drainage in the Metropolis, and a thorough compliance therewith—in the spirit as well as in the letter—would be productive of sound sanitary work in lieu of much that is at present dangerous to health.

COPYING PROCESSES FOR REPRODUCING AND DUPLICATING DRAWINGS, PLANS, &c.

(*Concluded from page* 414.)

TO CONVERT BLUE PRINTS INTO BROWN OR SEPIA TONE.

PREPARE a bath of liquid ammonia that contains 22 per cent. of the ammonia gas, and dilute this by adding 18 parts of distilled water, and let the blue print remain in this fluid for two to four minutes; then rinse in clear water and plunge it into a filtered solution of tannic acid 2 parts, distilled water 100 parts, and let the print remain in the fluid for about twelve hours to intensify the tone produced. If not deep enough, add a few drops of liquid ammonia to the tannic acid solution; then take out the prints and wash them, when they look like sepia drawings. A way of converting the greenish-toned prints to blue is to dip them in a 1 per cent. solution of sulphuric acid. Another process of converting blue prints to brown is this. Prepare the following solution: Dissolve 2½oz. of borax in 38oz. of hot water, and when cool add sulphuric acid in small quantities until blue litmus paper turns slightly red, and then add a few drops of ammonia until the alkaline reaction appears, and red litmus paper turns blue; then add to the solution 154gr. of red crude gum-catechu, and allow this to dissolve with occasional stirring. Immerse the blue print in this solution for a minute or two longer than it appears when the desired tone is produced, and then rinse in water; the resulting colour is olive or blackish brown. There are other methods of producing blue (and even green and red and violet) prints, of which the following are typical. Keep the paper which it is proposed to sensitise in a close box or canister, so as to keep it unexposed to light for a few days. Before sensitising this, float it in a bath of nitrate of ammonia prepared by 1oz. of the nitrate in 5oz. of distilled water. Allow the paper to remain in the bath four or five minutes, then lift it off, boxing it up in a dark room to dry. This paper so prepared can be kept for future use in dark receptacles. The exposure varies from one to several minutes in the sun's rays, and 15 to 60 minutes in diffused light. To develop the image thus produced, dip it for barely a minute in the following solution: 2dr. distilled rain-water, 7gr. of nitrate of silver, acetic acid a mere trace. As soon as the picture appears in perfect contrast to the surrounding surface of the paper, take it out and wash it in clear water, which will fix the print. To produce red prints, sensitise the paper by means of nitrate of uranium; drain and dry them in the dark, then expose beneath the drawing—done, of course, on translucent paper—for 8 to 10 minutes, then wash and immerse in a bath made up of 30gr. of ferrocyanide of potassium, 3oz. of water. When the picture appears in red colour, fix it by washing thoroughly in water. For a green print, proceed as above for red pictures, and then dip the red print in a solution of 30gr. of sesquichloride of iron, 3oz. distilled water. When the red print changes to green, wash it in water to fix the printing, and dry before a fire. For violet pictures, sensitise the paper with a bath made up of 2oz. of distilled water, 2dr. of nitrate of uranium, 3gr. chloride of gold, expose for 10 to 15 minutes, and wash in water and dry. A mechanical method of reproduction is the following process: The materials required are Japanese paper, a copying press, and a smooth polished zinc plate. To prepare the ink for the process, make a solution of methyl violet, or any other suitable aniline dye in water, and mix 3fl.oz. of this solution with 10fl.oz. of water, and add about 25 minims of acetic acid. To prepare the negative, moisten the cover of a sheet of Japanese paper and lay it on the zinc plate. Smoothed out on this, place a linen cloth which has been soaked in water and wrung out, so as to be not too wet, and on top of this, under the sheet of zinc, lay a pad made of a sheet of paper folded together several times; remove the linen cloth from the Japanese paper, when the latter will be sufficiently moistened. In a similar way moisten the sheet of paper on which the written matter appears, lay the written matter face down on the Japanese paper, place a sheet of paper over the written sheet, and put the whole on copying press. In a short time the Japanese paper will have taken a copy of the written matter (reverse to the original), and by laying sheet after sheet of damped paper on the Japanese paper negative, twenty or more copies can be readily obtained therefrom by putting the whole in the press each time. A ready means of taking a facsimile copy of a drawing done in ink which contains a salt of iron or copper, is to lay over it a sheet of paper which has been moistened with yellow prussiate of potash and pressing on it, when the iron or copper salt will react on the paper and leave a copy wherever it comes in contact with the ferrotype paper. Chemico-mechanical processes of reproducing drawings, written matter, &c., are familiar by reason of the hectograph and similar processes that depend upon material from which the reproduction is obtained. A simple means of duplicating drawings, &c., is this:—Prepare a compound of gelatine and glycerine (*vide infra*, the Hectograph) and spread it upon waterproof paper, and for the ink with which to make the drawing use the following fluid:—20 fluid ounces of water, 2oz. of chrome alum, 1oz. of sulphuric acid, 2oz. of gum arabic. Place the drawing upon the gelatine layer on the waterproof paper, and then lift it off, and pour over the gelatine coating a solution of an aniline dye, but not too strong, in water, and absorb any superfluous colour which may remain on the surface by laying sheets of tissue paper on the gelatine coating. To obtain the copies lay sheets of paper successively on the prepared gelatine surface and apply a slight pressure.

THE HECTOGRAPH

consists of an absorbent pad of a gelatinous nature which absorbs a certain amount of a specially prepared ink with which the drawing or written matter is done, and by laying on the gelatine surface sheets of paper, and applying a slight pressure, a dozen or two copies can be obtained from one negative. In this process it is apparent that the copy on the gelatinous surface is a negative, and that the copies obtained therefrom are positives or facsimiles (not reversed) to the original drawing. There are several formulæ for preparing the gelatinous compound, the best of which are given below. Anyone with a little skill can make a suitable apparatus, all that is necessary being a shallow tray of tin or other material into which the gelatinous compound is poured, and, when set, it is ready for use.

Hectograph composition, No. 1: Ingredients: 1oz. good edible gelatine, together with 6oz. or 7oz. of pure glycerine. Preparation: Soak the gelatine in cold water for 10 to 12 hours, so as to cause it to swell up but not lose its form separately. Put 2oz. of common salt (kitchen salt) in 1 pint of water, and put it in a saucepan to boil. In this boiling salt water stand a gallipot or earthenware jar in which the glycerine is placed, and heat the glyeerine until it is about 200° Fahr. Meanwhile pour off the unabsorbed water from the gelatine, and put the gelatine into the hot glycerine, and continue the heating for an hour, with careful stirring; but avoid whisking the mixture to a froth, or cause bubbles. When the mixture has been sufficiently heated, add 20 mimims (20 drops) of essential oil of cloves, so as to prevent the mixture decomposing, and then pour the compound into the shallow tray which is to receive it. Place this on a perfectly level surface in a place free from dust, and let it remain undisturbed for at least five hours.

NOTE.—If the gelatine be of poor quality, the compound will not "set" or gelatinise; in such a case, less glycerine should be used with such gelatine. The compound, however, thus prepared need not be wasted, but reheated, and a little more swelled gelatine added. When once you have prepared a suitable compound, take special note of the proportion of ingredients, and also the exact particulars which were followed in preparing same. The object in using a salt-water bath is to obtain a higher temperature—salt water boils at a higher temperature than fresh water—and also to prevent it being vaporised too readily, for such vapour would be absorbed by the gelatine compound, and consequently liquefy it too much.

Before using the gelatinous pad thus prepared, pass a wet sponge lightly over the face of the gelatine, and allow it to nearly dry before taking the first copy. If this precaution be not observed, the surface of the gelatine will be ruined by the first copy taken, as the gelatine will stick to the paper, and in lifting up same, it will more or less tear away the gelatine and produce a rough surface. The pad becomes worn out in time, but it need not be cast aside, as all that is required is to remelt the compound. After taking the required number of copies, wash the surface of the gelatine with a wet sponge so as to absorb out of it all the ink that remains therein; but if the gelatine pad is not required for several days, this washing is not necessary, as the ink will become absorbed out of the compound, and thus not interfere with a fresh drawing being laid on it. To use this pad, make the drawing with the special inks (see below). Allow the ink to dry, and then lay the drawing on the gelatine pad; slightly press the back of the paper drawing, so as to cause it to become in immediate contact all over; then gently lift up one corner of the drawing and strip it off the pad so as to carefully avoid blurring the inked portion. The drawing should remain on the pad about one minute before removal. To take the copies, hold the sheet of paper on which the copy is to be taken squarely and evenly above the surface of the pad, and then gently lower it to the surface of the latter, being careful that you do not shift it about after it has come in contact with the gelatine. Apply a slight pressure to the back of the sheet of paper, and then carefully lift it off by taking up one corner first, and stripping the sheet off. Proceed to take the other copies in a similar manner.

Hectograph composition No. 2.—10 parts of gelatine and 37½ parts of water (soaked), 37½ parts of glycerine, 5 parts of kaolin (china clay). The addition of the kaolin prevents the gelatine gelatinising too quickly, and at the same time renders the compound opaque and of a milky whiteness, which effectually disguises the actual composition of the compound.

No. 3.—10 parts of gelatine, 10 parts of dextrine, 100 parts of glycerine, baryta q.s. (the native barytes ground, or else the precipitate sulphate of barium may be used).

No. 4 (a cheap compound).—10 parts of good glue, 5 parts of glycerine, 2½ parts of barium sulphate, 37½ water.

No. 5.—10 parts of glue, 50 parts of glycerine, 2½ parts of kaolin or baric sulphate, 37½ parts of water.

No. 6.—3oz. of glue, 15oz. of glycerine, ¾oz. of kaolin, 11¼oz. of water. This will suffice for a tin trough 7in. by 11in. superficial. To prepare the compound on sheets instead of in troughs, proceed as thus described in the *Chemist and Druggist*:—"Soak 4 parts of best white glue in a mixture of 5 parts of water and 3 parts of a solution of ammonia until the glue is soft; warm the mixture until the glue is dissolved, and add 3 parts of granulated sugar and 8 parts of glycerine, stirring well, and letting come to boiling point. While hot, paint it upon white blotting-paper with a broad copying-brush until the paper is thoroughly soaked and a thin coating remains on the surface. Allow it to dry for two or three days, and it is then ready for use. An aniline ink should be used for writing, and before transferring to the blotting paper, wet the latter with a damped sponge and allow it to stand one or two minutes, then proceed to make copies in the ordinary way. If the sheets are laid aside for two days, the old writing sinks in, and does not require to be washed off."

Ink for use with the Hectograph.—No. 1:—Ingredients: 1oz. of aniline violet or blue (2 R.B. to 3 B.), 7fl.oz. of hot water, 1fl.oz. of spirit of wine, ¼fl.oz. of glycerine, a few drops of ether, 1 drop of carbolic acid to prevent decomposition. Dissolve the aniline colour in the water, and, on cooling, add the spirit and other ingredients, and put in well-stoppered bottle for use.

No. 2.—Black: 1 part of nigrosine soluble in water, 14 parts of water, 4 parts of glycerine. More glycerine, sugar, or gum arabic may be added to render it more copying.

No. 3.—Blue: 6oz. cotton blue (aniline), C.B., 1oz. glucose, ¼oz. glycerine, 1 quart of hot water. Rub up the blue in the hot water until dissolved; then add the other ingredients, and strain through muslin while hot.

To prepare tracing paper for architectural use, take common tissue or cap paper (any size of sheet); lay each sheet on a flat surface, and sponge over (one side) with the following, taking care not to smear any part of the surface: Canada balsam, 2 parts; spirits of turpentine, 3 parts, to which add a few drops of old nut oil. A sponge

is the best instrument for applying the mixture, which should be used warm. As each sheet is prepared it should be hung up to dry over two cords stretched tightly and parallel about 8in. apart, to prevent the lower edges of the paper from coming in contact. As soon as dry, the sheets should be carefully rolled on straight and smooth wooden rollers about 2in. in diameter, covered with paper. The sheets will be dry when no stickiness can be felt.

To render tracing paper more translucent, so as to allow the finest lines to be seen through it, soak it in benzine by means of a cotton pad, so as to thoroughly permeate the fibre. Indian ink, water colours, or pencil take equally well upon paper thus treated. For rendering opaque drawing-paper translucent, so as to permit of a photographic image of the drawing done on it to be depicted on some of the sensitised papers above referred to, there is nothing better than to saturate it with benzine. As this rapidly evaporates, the paper will resume its normal opaque appearance without showing the slightest trace of the treatment to which it has been subjected. Benzine vapour is easy to catch alight at a low temperature, so do not use it in the presence of a light or flame.

Another process of rendering ordinary drawing-paper transparent consists in dissolving a given quantity of best castor-oil in one, two, or three volumes of absolute alcohol, according to the thickness of the paper, and applying it by means of a sponge. The alcohol evaporates in a few minutes, and the tracing paper thus made is dry and ready for use. The drawing can be made with lead pencil or Indian ink, and the oil removed from the paper by steeping it in absolute alcohol, whence the paper resumes its original opacity. The alcohol thus used can be preserved for diluting the oil used in preparing fresh supplies.

VARNISHES FOR DRAWINGS.

Size the print with a solution of gelatine, and allow to dry before laying on the varnish.

No. 1.—Dissolve 5oz. of mastic resin, 2oz. of sandarac resin, 1oz. of camphor resin, 16oz. of spirits of wine 95°.

No. 2.—10oz. mastic resin, 20fl.oz. spirits of turpentine. Digest till the resin dissolves, and thin with turpentine for use. H. C. S.

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXXVI.

THE employment of trough flooring or decking has become nearly universal by reason of its combined efficiency and simplicity of construction. It secures strength without adding much to dead weight. The latter consideration is of very high value in all bridge work, in which it is desirable to lessen that dead weight which has to be carried by the bridge itself. It embodies the principle of corrugation or fluting, which has been so successfully applied in other ways. Steel is the material used. It is built up into a good many sections, ranging between the rectangle and the arch, and, in different dimensions, is used for all kinds of floors and roadways, ranging from the lightest sections suitable for floors of warehouses, to road bridges and the heaviest railway-bridges. It occurs in pitches from 4in. to about 3ft. 4in. It has displaced largely the buckled plates, both of cast and wrought iron resting upon cross-girders.

The trough floorings are immensely strong by virtue of their corrugated, splayed, or arched forms. They are in effect single girders, rigidly united, combining the strength of single girders with the distribution of the load over several so connected. For the latter reason, theory has been much at variance with regard to the allowances to be made for distribution of load, whether over two or three adjacent troughings. It is often the case that the troughing carries the whole load without any other aid. In railway bridges the sleepers aid in distributing the load. In many instances the abandonment of the ordinary cross-girders in favour of the troughing has not only lessened the cost, but has got over difficulties on the score of head room. Drainage, too, of bridge-floors is secured in a much better manner than with girders and ordinary plates, or with timber.

Trough floorings were originally invented for the purpose of dispensing with wood flooring, and, to a certain extent, with rail-bearers or short longitudinal girders placed under rails, and to dispense with the ordinary floor-girders. These

Fig. 258.

floorings were first patented by Mr. Barlow in 1856. In 1865 Mr. Crompton patented the Lindsay section, afterwards patented by Lindsay in 1882. Many other patents have been taken out for trough floorings, and some of these have become very generally used.

Troughings are variously arranged and variously connected to girders. Generally they are

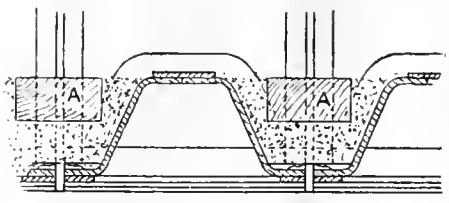


Fig. 259.

placed transversely. In long-span bridges this is always the case, and the transverse sleepers are laid in the hollows of the troughings imbedded in the ballast. The rail-chairs are spiked to the sleepers, so that the pitches or points of bearing of the rail are equal to the pitch of the troughing. In heavy troughing, packings are often laid on

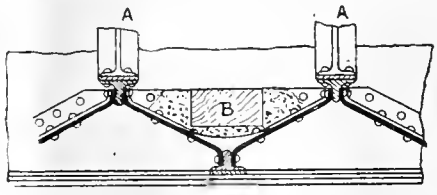

Fig. 260.

the crowns of the troughs intermediate between the sleepers and chairs, to increase the distribution and reduce the shear on the rivets. In road-bridges having spans not exceeding about 36ft., the troughing is often laid longitudinally, covered with concrete and wood flooring. The early troughing was generally too narrow and too

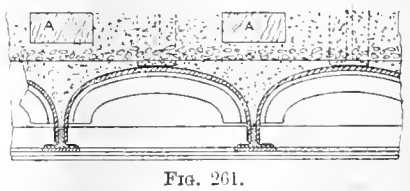

Fig. 261.

shallow, the idea being to obtain a better distribution of the load. But the modern practice is to use deep and wide sections, which distress the rails less, which cost less for riveting, and which present fewer possible sections of leakage. Troughing is often cambered to allow the rain-

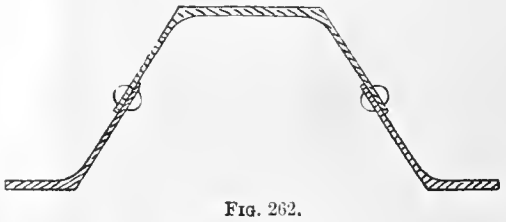

Fig. 262.

water to run off. This escapes through drain-pipes into guttering suitably arranged.

Trough floorings have been made as in Fig. 258 by riveting wide bars together with angles. In many cases the form has been rectangular, instead of that with sloping sides. The objection to the method of jointing shown in Fig. 258 is the cost of riveting, and the weakening effect of lines of rivets. Hence all modern troughings are stamped in sectional widths, which may be of half the pitch, or two, or three pitches wide. The succeeding figures show some of the trough sections most generally used for floors.

Westwood and Baillie's troughing is shown in Fig. 259. It is composed of rolled sections of steel plate, which are riveted at top and bottom. The timber sleepers A A are bedded in sand and gravel on asphalte in the troughs, so doubling the bearing surfaces for the rails.

Fig. 260 illustrates Hobson's diagonal trough flooring. In this the plates are splayed and riveted to top and bottom angles. The bottom angle is riveted to the bottom angles of the main girders, and the stiffeners A A are riveted to the top angles. The ends of the plates are riveted to the girder webs with angles. A layer of asphalte is laid over the plates, and sand and gravel above, in which the sleepers B are embedded. This is

Fig. 264.

not used so much as the arched flooring, seen in Fig. 261, which is adopted extensively, the pitch being generally 2ft. 6in., the plates being $\frac{5}{16}$in. thick, 15in. deep in the middle of the arch. The plates are riveted to the sections which rest on the bottom flanges of the main girders. Asphalte covered with sand and gravel is used, the sleeper A being imbedded in the latter. Hobson's arched flooring was used on the Liverpool Overhead Railway.

Two sections of Lindsay's troughs for flooring are shown in Figs. 262, 263, as made by Dorman, Long, and Co. They consist of splayed

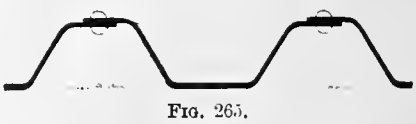

Fig. 265.

channels riveted at the sides. The section in Fig. 262 ranges from a weight of 19·06lb. per square foot covered to 51·83lb.; and Fig. 263 in 32·18lb. and 56·76lb., the latter being 1ft. 5¼in. deep and 3ft. centres, ⅜in. thick in sides, and 1in. thick at top and bottom, and being suitable for a double line of railway. The lightest section of 19·06lb. is but 4¼in. deep, 12in. centres, $\frac{3}{16}$in. thick in sides, and ⅜in. at top and bottom. The firm make 15 different sizes, and give the moment of resistance for each, and tables by which the section suitable for carrying a given weight can be determined. Lindsay's flooring is used for road-bridges of short span, the troughing running longitudinally and the parapets being riveted to the top of the flanking troughs.

Fig. 263.

It is also employed for the fireproof floors of public buildings. The troughing, filled with concrete, separates the floors, the flooring boards being laid on joists embedded in the concrete, and the lathing being attached to a backing of quartering which is bolted to the bottom of the troughing.

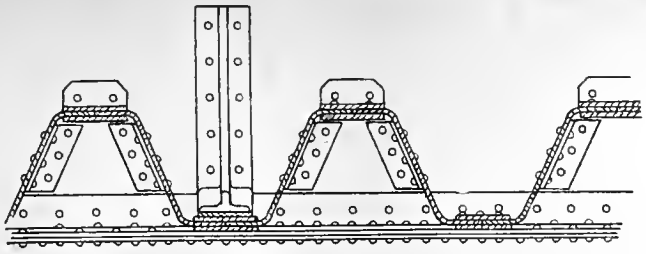

Fig. 266.

Two of Braithwaite and Kirk's floorings are shown in Figs. 264, 265. Fig. 264 comprises two Z-sections riveted at top and bottom, stiffening cover-plates being added. Fig. 265 is rolled

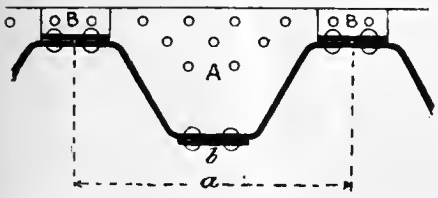

Fig. 267.

into the trough form, and riveted with single or with double riveting.

The ordinary trough floorings are attached to main girders by means of angles, either in the manner shown in Figs. 259, 260, 261, or in Fig. 266. Strickland's troughing, manufactured by

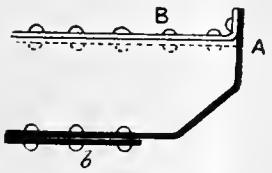

Fig. 268.

the Patent Shaft and Axletree Co., Limited, of Wednesbury, is of the usual angular type ; but it is distioguished by the ends being boxed in, instead of open. The bent angle-irons, therefore,

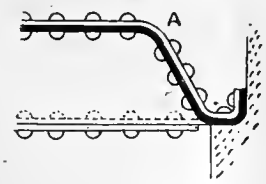

Fig. 269.

which are used to connect the ends of the open troughing to the webs of the main girders, are dispensed with entirely, the stamped boxed ends being attached directly to the girders. One advantage is, that there can be no leakage at the

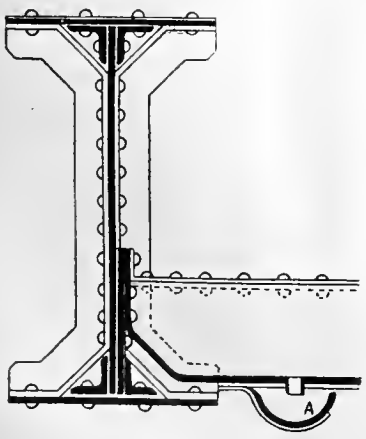

Fig. 270.

ends. Also, in the ordinary floorings, the girders are partly covered by the ends of the troughing, and cannot be painted. In the Strickland type the girders are left exposed for painting. Another advantage claimed is that the ends of the troughs are suspended from the webs, instead of resting on the flanges, which latter tends to twist the main girders under heavy loads.

Fig. 267 shows a section through the troughing, where A is a turned-up end, riveted to the

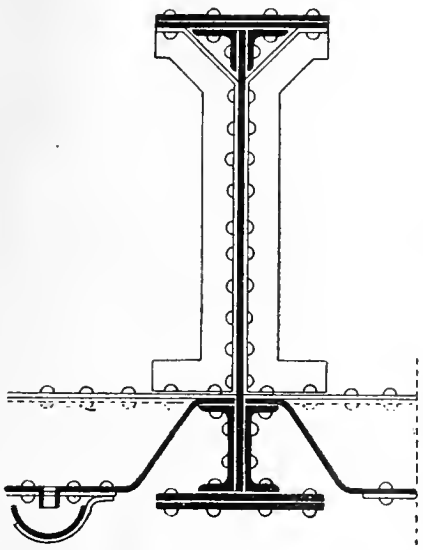

Fig. 271.

girder. The length *a* is the pressed width or pitch of trough, *b* is a stiffening bar, and B B are covers and stiffeners turned up at the ends and riveted to the girders. Fig. 268 is a section next the end, showing A, *b*, and B. Another method of fastening is shown in Fig. 269. Here the ends are turned up to the section shown, or in any other proportion, and the cover-plate A

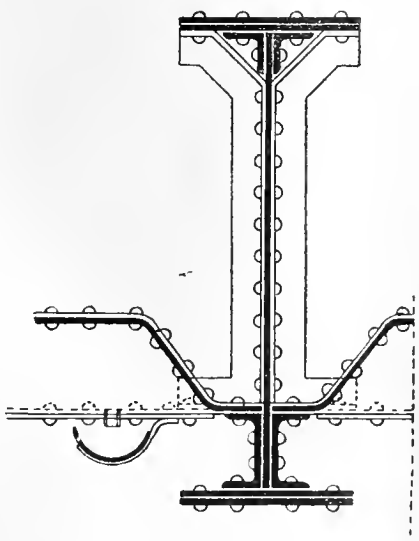

Fig. 272.

follows round the shape of the stamped end. Fig. 270 shows the end of the type in Fig. 268 attached to a main girder, with the drainage-pipe. The plate and cover are notched to allow the stiffener to pass down ; but the stiffener is sometimes turned over on top of the trough instead. The drain-channel is seen at A, and with the troughing cambered the water runs to the ends, and through the drain-pipes into the gutter.

Fig. 271 illustrates an attachment of Strickland's troughing to channel irons, which are

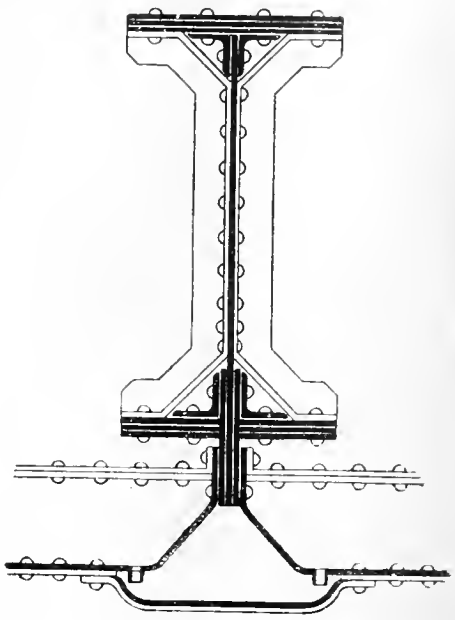

Fig. 273.

made to form the union between the web and the bottom flange of the main girder. The stiffeners stop at the troughing. The drainage gutter is seen ; or, the troughing can be inverted on the

Fig. 274.

channels, giving greater head room underneath, as in Fig. 272. Fig. 273 shows the flooring suspended from the main girder, the webs being continued past the bottom flange, and reinforced

Fig. 275.

to take the strain A single wide gutter is common to adjacent drain-pipes. For special strength the troughings are stiffened as in Figs. 274, 275 ; in the first case with double

Fig. 276.

covers, in the second with tee sections. Very light sections are stamped as in Fig. 276, from 16in. pitch down to 4in. pitch, for warehouse floors and light bridges. J. H.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

RE-ELECTION OF THE PRESIDENT.

A SPECIAL general meeting of the Institute of British Architects was held on Monday evening. Mr. Alexander Graham, F.S.A., the chairman of the meeting, moved that in accordance with a recommendation of the council, Professor George Aitchison, R.A., be requested to allow himself to be nominated as President for the year of office 1898-99, and consequently by-law 26, which limits the duration of the

presidential term of office to two years, be suspended. This motion was seconded by Mr. John Slater, and was carried unanimously. A meeting for the confirmation of the resolution for the necessary suspension of the by-law will be held on April 18th.

An ordinary meeting of members was held immediately afterwards. Professor Aitchison, R.A., the President, who had not been present at the previous meeting, was summoned from the arbitration-room below and informed of the decision arrived at by Mr. Graham, who then vacated in his favour.

Artistic Copyright, with Special Reference to Architects.

A paper on this subject was read in excellent and terse English by M. Georges Harmand, Avocat à la Cour d'Appel, Paris. The author explained that one of his objects was to give an idea of the state of opinion on the Continent regarding the question of copyright. Over the greater part of Europe architects enjoyed protection for the works they created, and it was of greatest importance that the profession in England should have the same privileges. Unity in the protection of their art was the best means to its development and its triumph. The fact that for a long period architects had not claimed copyright in their works was no reason against the right. There was ample evidence to show that from remote ages architects had been accustomed to put their names, or to leave some other trace of their personality, on the monuments they erected. Instances of the custom were cited by the lecturer from a paper read by M. Charles Lucas at Milan in 1892. Years before any other European country, England had promulgated laws for the protection of artists and authors. Till quite recently, however, the reproduction of architects' designs for publication was an expensive matter, and only monographs of a few very important buildings, or the works of a few very great architects, had been published—and that in exceedingly limited numbers. In the present day it was easy for architects to get photographic and other reproductions of their works, and for the sake of their own memory, their credit, and their fame, they should strive to secure the preservation of their drawings and the guarantee of their authorship. In England the rights of artists in reproducing their works by printing processes were protected by statute, architectural drawings being expressly mentioned; but English architects apparently lacked confidence in their rights, and hesitated to claim the protection of the law afforded them. The question of unification of the legislative measures relating to copyright had been well thrashed out at congresses held by the International Literary and Artistic Association in various cities of Europe; and, as a result, a convention was agreed upon at Berne, in 1886, between Great Britain, France, Italy, Spain, Belgium, Germany, &c., which provided for the grant of copyright to, among other works, drawings and works of painting and sculpture, to engravings, prints, &c., and to "plastic works relating to geography, topography, architecture, and sciences in general," also to any production belonging to literature, science, and art capable of reproduction by printing, &c. But the law of some nations party to the convention did not fully protect architecture. In Germany an architect enjoyed copyright in his designs so long only as they existed on paper; he lost his rights in his drawings as soon as a building was erected from them. In Great Britain, the lecturer understood, architecture was not protected by law, except for drawings and plans. Conferences had been held all over Europe by the association above referred to, and strenuous efforts made to secure full protection for architecture. Having dealt with the object of copyright, its privileges, the class of work whose authors were universally admitted to be entitled to the right, the lecturer went on to show that, by their methods of work and the nature of their inventions, architects were in a similar position to painters, sculptors, and other artists, and should be conceded the same safeguards for their protection. Quoting judgments of French and Belgian legal tribunals, emphasis was laid on a decision at Antwerp in October, 1893, where it was held that, in order to be considered the author of a protected work, it was not necessary for a man to produce a work entirely original in all its parts; it was sufficient that he had made a design, traced a drawing and plan, and infused his own individuality into elements gathered from works whose copyright had expired. Such was an artistic creation which merited the protection of the law. The lecturer then touched upon the arguments adduced against the rights contended for, and having shown their unsoundness, proceeded to treat of the

Relations between the Architect and his Employer.

The architect furnishes plans and drawings, and agrees with his client for their reproduction in a building on a certain site. Such plans and drawings represent the original work of the architect. The client bargains for the possession and use of the building, and the enjoyment of its beauty, if it have artistic qualities. But, the lecturer contended, the right of reproducing the building on paper, by drawing, photography, or printing process did not pass to the client, but remained in the architect. If the client desired in any way to reproduce his building pictorially by engraving or other process, the architect could consent, for an agreed consideration, or he could refuse. The client, again, had no right to the original drawings, but only to copies, and this was sufficient to warn the client that the architect intended to keep the copyright for himself. The drawings handed to the owner should show some evidence of their being copies merely, and should bear the architect's signature. The owner had no right to repeat the building on any other site, or to permit anyone else to do so. The architect received fees calculated on the cost of the one building only. Repetition could only be made with the architect's sanction; and if repeated, he was entitled to fresh fees. It was important for the preservation of his rights that the original drawings should bear the architect's signature. His signature could not well be preserved on the buildings themselves; but as they were mere reproductions of his drawings, his interests would be sufficiently safeguarded by the signature being placed on the original drawings, and any copies, prints, or photographs of them. An architect could always print reproductions of his drawings under his own name; but the client had no more right to make prints or photographs of his buildings without the architect's consent than to repeat the buildings on another site. In concluding, the lecturer expressed his conviction that when architects felt that they could work and create for their profit, and have the reward of their pains and efforts, they would strive more after genuineness, and architecture as an art would progress, to the greater glory of beauty. If architects in Great Britain did not enjoy such rights in their creations as the lecturer had advocated, he hoped they would do their utmost to prevent the matter being overlooked in any new Copyright Act.

Professor Robert Kerr, in proposing a vote of thanks, remarked that M. Harmand's suggestive paper was full of information with regard to other subjects also; but he feared the matter was looked at from very different standpoints here and in France. If in this country there was a chance of establishing anything in the nature of architectural copyright—and he for one did not regard it as possible—it would be a means of raising the status of architects. The fact must be faced that peoples of the Latin race were possessed of a faculty for art and its appreciation which we of the Teutonic race could not pretend to, and when the lecturer referred so eloquently to the architect's "glory," he was compelled to inform him that such a characteristic would not be recognised as a possibility in an English court of law, and that architectural copyright would fare badly in the hands of forensic gentlemen in this country. The difference between architecture and the other arts was practically very considerable, and the views that might be taken of architectural copyright in our courts of law might be this: that the common law recognised as deserving of protection that which possessed a commercial value and nothing else. If the architect could show a court what material damage he had sustained in pounds, shillings, and pence, his claim would be considered; but neither judge nor jury could understand any injury to his *amour propre*. The lecturer had throughout insisted on the merit of an architect's work lying in the architectural drawing and not in the executed building; but such a theory would not be recognised in an English court of law. It was well known to all English architects that our judges had ruled that the ownership of drawings was vested not in the architect who prepared them, but in the building owner who ordered and paid for them; and that decision would not, he believed, be shaken, let them try as they might to do so. Certainly, any drawing, of whatever kind, could be protected against reproduction if the originater cared to register it and pay the fee. Again, an architect could, if he chose, patent any idea for a number of years, securing a monopoly in its use, on condition that he made its principle open or patent—but these were obviously very different from copyright. The principle that a man should not be at liberty to copy the arrangement, plan, and treatment he had ordered to be prepared for his own house, or that he should be prohibited from giving a friend permission to reproduce it, would not be tolerated in this country. A genuine grievance an English architect felt was that when he had been employed to design a house in the suburbs, two or three house agents would send emissaries to copy its leading points, paying these men as little as 5s. a piece, and that the design with which he had taken such pains was reproduced, more or less badly, all over the district. In conclusion, he could not agree that an architect should be protected to the same extent as a painter or sculptor, for his designs, except as means to an end, were not saleable as were theirs, and, therefore, the architect suffers no such pecuniary loss in reproduction.

Mr. John Slater seconded the vote of thanks, remarking on the excellent English in which the author had expressed his thoughts. All English architects were well aware of the decision of the judges as to the ownership of drawings, and although it was an absurd one, it could not be gainsaid. The only remedy the architect had was to draw so badly that it would not be worth the client's while to claim them, or to prove to the client that he was not paying for the mere drawings. He differed from Professor Kerr, and thought that the well-planned and designed building was just as saleable as the picture or statue would be, and he believed English architects would be only too happy if M. Harmand's efforts to secure an equitable international law of architectural copyright were successful.

Mr. John Hebb thought the matter lay in a nutshell. At present it would be quite useless for an expert architect to assert a claim to copyright in his drawings in the face of the decision of the courts that this passed to the building owner. He was not sure, moreover, whether architects objected to being copied, for imitation was the most sincerest form of flattery. If they appealed confidentially to Mr. Norman Shaw or to Mr. Mountford, he believed they would not express annoyance that they had each, in their own way set a fashion among the younger men.

Mr. E. W. Mountford observed that it would be interesting to hear whether the experiences of a firm of architects in the North of England, who patented a particular plan in a competition design, had been satisfactory, and whether their example had been followed by others.

Mr. E. W. Hudson reminded the members that in 1877, when a Royal Commission was inquiring into the question of copyright, the then President of the Institute, Mr. Charles Barry, gave evidence in which he demanded that architects should be given the right of reproduction extending over 20 years, but the Commissioners rejected his proposal. The architects' drawings which passed to the owner were the contract drawings signed by the builder, and therefore he did not see any objection in equity to the English law on the point. He referred in detail to the variations in Continental law on this point, observing that Austria and Hungary were governed by different regulations, while architects were better protected in Russia than in any other country.

In putting the vote of thanks, the President remarked that with small buildings the architect's remuneration was quite disproportionate to the time and labour expended on the plans, and it was annoying to see a design for, say, a farmhouse, prepared with much care, repeated all over an estate and the adjoining ones without acknowledgment to the author. At the same time, it would be so easy to make trifling alterations in materials or plan in execution, that it was not easy to copyright such designs. Architectural drawings were quite a modern idea; from the 6th to the 18th centuries all large buildings were erected from models, and the architect was also the contractor.

M. Harmand, in replying to the vote of thanks, observed that while few English architects would agree with his views on copyright,

they would generally concur that the damage done to the author by imitation was twofold—first, he lost the remuneration to which he was justly entitled, and, secondly, he suffered in reputation from the poor and incorrect reproduction.

THE SOCIETY OF ARCHITECTS AND REGISTRATION.

THE question of "The Statutory Registration of the Profession" has occupied the minds of architects for many years, and the council of the Society of Architects is now taking steps to obtain the views of provincial architects upon the subject, with reference to which a Bill has been introduced into Parliament in the present session. With this object a meeting of architects was held on March 25th in the library of the Philosophical Hall, Park-row, Leeds. The chair was occupied by Mr. T. Walter L. Emden, J.P., L.C.C., President of the Society of Architects. There was a good attendance. In opening the proceedings, the chairman said they believed that if every architect were compulsorily submitted to examination, they would by that means be able to protect the public from men who were incompetent, and at the same time protect the profession from what he might call illegitimate competition. Mr. Ellis Marsland (hon. secretary) read a paper on the question. He asked what was meant by registration? It meant, in the present, that every man practising architecture should be duly enrolled in an official register under an Act of Parliament, and be duly responsible for his professional actions, and that no one be allowed to practice until he had been duly enrolled. In the future it meant that no one be allowed to practise architecture until he was duly qualified and had been found so by undergoing a qualifying examination. At present any person, with or without a fair general education, any builder, builders' foreman, clerk of works, clerk in a local board office, auctioneer, undertaker, "et hoc genus omne," with the sole qualification of being able to provide a brass plate, was at liberty to advertise him as a person qualified to give advice to the public in the science and art of architecture. Builders and others going out of their proper province boldly proffered their services as architects to their customers gratis; and the tempting bait of an apparent saving of 5 per cent. was not to be resisted. Could it be wondered at that they were still unrecognised while such a condition of things existed? For at present the public had no guarantee that the class who called themselves architects were any better qualified to plan and design their buildings than the contractors who erected them, and should they employ an architect they had no means of ascertaining that his knowledge was greater than that of the builder, and the only certainty about it from their point of view was that they would have to pay the professional charges. The advantages arising from registration were these:—Closing the doors to incompetent men; raising the standard of the profession; and obtaining the confidence of the public and State recognition. It was not proposed for one moment to say that all who desired to build should employ an architect; but what they did propose was that henceforth, in the interests of the public, no person should be entitled to call himself an architect whose name was not enrolled as qualified under an Act of Parliament, and any person wishing to employ an architect might, by consulting the official register, ascertain what men were qualified. Mr. J. Wreghitt Conron (Leeds) moved the following resolution:—"That this meeting cordially approves the principle of the statutory examination and registration of architects, and is of opinion that it is desirable, in the interests of the public and the architectural profession, to promote a Bill in Parliament for the attainment of this object." He thought they were all agreed that the profession of architecture was by no means in the position it ought to occupy, or that it was in the possession of those facilities or advantages which it was entitled to possess. For instance, they would be agreed that the profession fell very far short of the professions of law and medicine in the facilities which were afforded it for educational purposes. They would also be all agreed that under existing conditions the profession of architecture did afford opportunities for entry into it of those who were not strictly entitled to belong to it: and he was sure they would all be agreed that the number of architects was certainly in excess of the requirements of the population of this country. There were in the country some 1,500 more architects than there was any necessity for, and there was only one remedy for that state of things, and that was a system of legal registration of architects. He expressed regret that the Royal Institute of British Architects should not yet have seen its way to give its weight to this movement. When it became convinced that the great body of the profession throughout the country was in favour of it, it would then give it its support. Mr. D. Dodgson (Leeds) seconded the resolution, which, after a brief discussion, was carried unanimously. Votes of thanks to the president and the hon. secretary, proposed by Mr. W. S. Braithwaite (Leeds), and seconded by Mr. B. D. Fairbank (President of the Bradford Society of Architects), concluded the proceedings.

THE PROTECTION OF UNDERGROUND WATER SUPPLIES.

AT a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening, Mr. W. Worby Beaumont, president, in the chair, a paper was read by Mr. John C. Thresh, D.Sc., M.D., &c., entitled, "The Protection of Underground Water Supplies." The author pointed out in the first place that recent outbreaks of epidemic disease, due to polluted water supplies, had demonstrated in a terribly emphatic manner that there was either much wilful carelessness, which required to be rebuked, or much ignorance which required to be dispelled. The discoveries of bacteriologists had proved that these water-borne diseases were due to specific organisms, and these organisms might gain access to, and be carried by, a water otherwise organically pure, as well as by an organically contaminated water, although the latter water would almost certainly be more liable to specific pollution, and therefore be more dangerous. Underground water was derived from that portion of the rainfall which passed by percolation into the subsoil. In this country, nearly the whole of the exposed surface of the permeable strata was under cultivation, and on account of the facility with which water was obtainable, the population thereon was considerable. The subsoil water must therefore be contaminated at its source, and were it not that there were powerful natural agencies at work capable of producing perfect purification, underground waters would be too dangerous to be utilised for public supplies. Where such water was collected in close proximity to houses, from wells sunk in a sewage-sodden subsoil, it was notoriously liable to pollution, and was a prolific cause of the dissemination of disease. The records of the outbreaks of typhoid fever and cholera in this country were sufficient proof of that. These impurities, however, were not carried far in a compact permeable subsoil, although in a fissured stratum they might be carried very considerable distances. During the progress of the polluted water through the subsoil the organic matter became broken down, and finally oxidised or burnt up, the ashes (carbonates, chlorides, phosphates, sulphates) alone remaining to afford evidence of the previous contamination. The particulate matter, including the micro-organisms, was more or less completely removed by the process of natural filtration implied by the percolation, and it seemed certain that specific organisms gaining access to the subsoil water speedily perished. There was no record of any outbreak of typhoid fever being caused by underground water taken from a wisely-selected and properly-protected site. The investigations of Pettenkofer, the researches of Hanser, and the recent experiments of Martin and Robertson all tended to prove that the typhoid and cholera bacilli could only flourish near the surface and in a polluted soil, and Fraenkel had shown that the subsail, even where the soil above had been grossly contaminated for a long period, was quite free from germs. That result, the author stated, he had recently been able to confirm in the examination of sand taken from various depths below the ground surface. At 4ft. very few organisms were found; below 5ft. none were discovered. These facts supported Koch's statement that "we have no reason to keep out of consumption the subsoil water which can be found nearly everywhere. On the contrary, we cannot find a better filtered water, and one more protected against infection." Although the use of water from shallow wells sunk in populous neighbourhoods was not to be commended, there was very little doubt that in many such places a perfectly safe water could be obtained from the subsoil, from a properly constructed well, with clean immediate surroundings. Shallow wells supplying only a few houses, drew water from an exceedingly limited area, the cone of depression rarely exceeding 5ft. or 6ft. in diameter, and it was the ground surface over that cone which required special protection. A shallow well yielding 15,000 gallons of water per day, and depressing the water level 9ft., would produce a cone of depression with a base about 34ft. in diameter in a sandy subsoil. Round such a well there should be a protective area with a radius of 30ft., upon the surface of which no contaminating matter should be deposited, and which should be so guarded as to prevent the public having access. Encircling this should be an outer zone, which might be used for grazing purposes, but not otherwise manured. The area of this outer zone would have to be decided upon in each case after a due consideration of all the factors involved—such as the contour of the ground, the direction of flow of the ground-water, the depth and fluctuations of the water-level, &c. In certain cases an elliptical area would be preferable to a circular one, especially in the case of springs. Where collecting-channels fed the well, these should be not less than 10ft. below the ground-surface, and included within the protective area, and within the inner zone of that area if possible. Where wells were sunk in fissured strata, the form and extent of the protective area would require even more careful consideration, and should include the surface at which the fissures were most likely to outcrop. The water from the more freely flowing fissures should from time to time be examined, to ascertain whether any show signs of contamination: and if, after a heavy rainfall, the water became in the slightest degree turbid, danger was indicated. In the construction of deep wells, the greatest care should be taken to exclude subsoil water, and further, an area round the well should be protected, so that if any subsoil water did gain access, it would be free from the possibility of specific pollution. The use of the bore tube as the pump suction pipe was not to be commended, since the external atmospheric pressure would force air or water through the most minute aperture. Where the outcrop of the stratum yielding the water was within a few miles, it should be subject to examination, as impurities entering fissures might travel such a distance. Whether underground water be drawn from a deep or superficial stratum, the chief factor in guarding it from pollution was the provision of a protective area round the well or spring, under the absolute control of the purveyors of the water, the inner portion of the zone immediately surrounding the source being so protected that neither tramps, hop-pickers nor the general public could gain access. Existing sources of supply should be examined, and steps taken, if necessary, to secure adequate protection. Where, unfortunately, protection was impossible, it would be better to voluntarily abandon the works than wait until an outbreak of disease aroused public indignation, and compelled their abandonment.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

THE twentieth annual dinner of this deserving and useful charity was held in the King's Hall, Holborn Restaurant, on Tuesday evening, and was more numerously attended than any previous festival. The chair was occupied by the president for the year, Mr. R. C. Foster, of the firm of Messrs. Foster and Dicksee, of Rugby, who by his frequent and pithy anecdotes enlivened the after-dinner proceedings, and among the 345 friends and subscribers to the Institute who supported him were Messrs. T. E. Collcutt, F.R.I.B.A., Edwin T. Hall, F.R.I.B.A., T. J. Bailey, F.R.I.B.A., William Woodward, A.R.I.B.A., Thomas Hall (Hall, Beddall, and Co.), ex-president, S. J. Dicksee (Foster and Dicksee), Joseph Randall (Kirk and Randall, of Woolwich), J. Howard Colls, Howell J. Williams, L.C.C., B. Eyres, C. Bussell, Octavius Newling, B. Hellyer, W. Nash W. Dyce, J. Ewitt, H. W. Parker, C. K. Turpin, E. C. Roe, &c. The loyal toasts having been given from the

chair, that of the "Army, Navy, and Reserve Forces" was proposed by Mr. W. Downs, and acknowledged by Mr. J. O. Belcher. In proposing the toast of the evening, "Success and Prosperity to the Builders' Clerks' Benevolent Institution," the President remarked that it was founded in 1806, and during the two-and-thirty years it had accomplished a great amount of quiet and beneficent work. It was established entirely by self-help. Two or three builders' clerks felt that sufficient was not being done for their class; and while it had been well supported by the body it sought to benefit, it had been most liberally supported by the builders and builders' merchants. So successful had it been, that its successive committees had distributed no less than £7,228 in pensions and temporary relief, and had purchased three presentations to the Orphan Working School at a further cost of 750 guineas in all, representing a total of £8,017. Having referred to the indebtedness of the institute to the courteous and indefatigable secretary, Mr. H. J. Wheatley, and the commitee, the President added that the funds were administered on an economical basis, so that out of every 20s. contributed, 18s. was immediately available for benevolent purposes—a proportion which would compare favourably with the administration of most missionary societies, and certainly with the London County Council and our Government Departments. They had recently lost by death their genial friend Major E. C. Roe, for many years a member of this committee, and who was formerly a clerk in the employ of the speaker's father, and also Mr. Thomas Peto Ward, the actual founder of the institution, and one who had laboured zealously and faithfully in its behalf for many years as one of the committee. In appealing for liberal aid, the President added that during the year of office of his immediate predecessor, Mr. Thomas Hall, the largest income had been raised since the foundation of the institution, and he hoped that would now be exceeded. From the contractor's point of view, no body of men were more deserving of assistance than the builders' clerks. They were a competent and hardworking class; they formed no trade-union to bind or harass employers, and were not too exacting as to overtime, and the ranks of contractors were largely recruited from among them. The toast of "The Architects and Surveyors" was proposed by Mr. Howell J. Williams, who said that these professional gentlemen represented the bread and cheese of the contractor. He repelled the slur recently cast on our architects by Sir William Harcourt during the debate on the Government Buildings Bill. He had had the good fortune to travel over a great portion of the world, and had seen no finer example of modern Gothic than the Houses of Parliament, which were gained in competition, and if the Government, who were about to spend two and a quarter millions on new offices in Whitehall, would have the courage to throw the designing open to competition instead of restricting it, as proposed, to their permanent officials, he had no doubt that the younger architects would rise to the occasion, and show themselves well able to grapple with the problems set before them. Having referred to the surveyors, he deprecated the practice of some architects taking out their own quantities, as these were neither so full nor so reliable as those prepared by men who devoted themselves exclusively to that work. Mr. E. T. Hall, in responding, congratulated builders and their clerks that there was every sign of abundance of work for a long time to come. The very large scheme for building Government offices in Whitehall to which Mr. Williams had alluded must indirectly bring employment to the trade generally, and he was glad to see that there was a growing appreciation of architecture among the public, which in towns affected the great spending bodies, and stimulated them to provide themselves with more worthy and dignified buildings than were considered necessary in the past. Mr. Williams had referred in terms of praise to the Houses of Parliament, and we had no occasion to be ashamed of the work of our modern architects in this country, and going back two centuries, he held that there was no more beautiful building in the world than St. Paul's Cathedral, nor a tower and spire which surpassed Bow Church, while our Mediæval churches and cathedrals were equal to those to be seen anywhere. As to surveyors, he would assure Mr. Williams that it was the exception for London architects to prepare their own quantities, and personally he deprecated the practice, for the architect was unavoidably biassed to keep down the quantities, whereas the surveyor was perfectly independent of building owner or builder, and was more likely to see justice done on both sides. Mr. H. J. Oldham gave the toast of "London and Provincial Builders," remarking that for 20 years the Institution was almost entirely supported by Metropolitan builders and their clerks; but during the last seven or eight years they had looked further afield, and rightly so, as provincial builders and their clerks were carrying out more and more work in London. Their President, that evening, was an example in point, and he was endeavouring to bring provincial builders' clerks and their employers in as supporters of the funds of their most useful charity. Mr. J. Howard Colls responded in a humorous speech. The secretary, Mr. Wheatley, read a long list of subscriptions and donations, including the president and his firm, 25 guineas; the Institute of Builders, 10 guineas; Messrs. English Brothers, Wisbech, 10 guineas; John Mowlem and Co., 10 guineas; George Farmiloe and Sons, 10 guineas; Joseph Randall, 10 guineas; the Carpenters' Co., Eastwood and Co., W. Oliver and Sons, Nobles and Hoare, Thomas M. Rickman, B. J. Hudson and Sons, Farnley Iron Co., T. Lampard Green, Dent, Hellyer and Co., and T. W. Alsop, 5 guineas each; and Slater, Bird and Co., £5, and very many donations of lesser amount, including a large proportion from builders' clerks. The President announced the total amount as £480. Mr. E. B. Gammon proposed "The Builders' Merchants," which was acknowledged by Mr. T. W. Alsop. The remaining toasts were: "The President," given by Mr. Leonard J. Maton, and acknowledged from the chair, and "The Past Presidents," proposed by Mr. H. W. Parker, and acknowledged by Mr. Thomas Hall.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XX.

By an Assoc. Inst. Elect. Engs.

measuring instruments and testing.

DETERMINATION OF RESISTANCES.—We have previously remarked that the resistance of conductors plays a most important

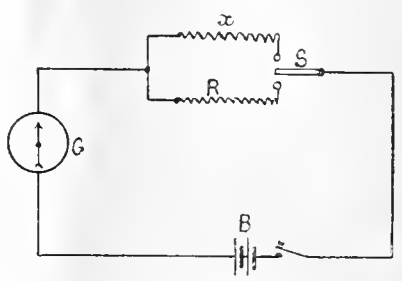

Fig. 63.

part in the distribution of electricity for commercial purposes, and we shall give here some methods of determining the resistances of conductors in practice. We must, of course, refer the reader to works dealing specially with electrical measurements for details, as we can only allude briefly to the everyday practical methods. In nearly all methods the determination of the resistance of a conductor is made by comparing it with others whose resistances are known. Probably the readiest and simplest method is by the *fall of potential method*. As is well known, a current traverses a conductor whenever two points in the conductor are maintained at different potentials, and its magnitude is limited by the difference of potential so maintained, and the resistance of the conductor between these two points. The relationship between these quantities is given by Ohm's law as follows:—

$$C = \frac{E}{R} \quad \text{and} \quad R = \frac{E}{C}$$

where C denotes the current, E the difference of potential between the two points, and R the resistance of the conductor between the two points. If an ammeter be inserted in the circuit, and a voltmeter be connected between the two points, C and E are given by the readings of these instruments, and the ratio between them gives R.

For the purpose of comparing the resistance of a conductor with others known, it is usual to have a number of accurate standard coils, arranged so as to form a resistance-box. These coils are constructed

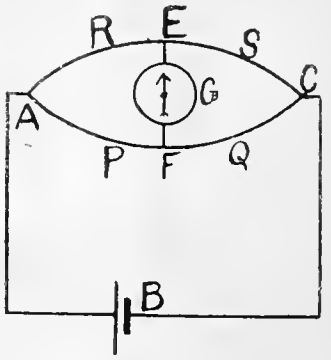

Fig. 64.

of metals possessing a high specific resistance and a low temperature coefficient, German-silver and platinum-silver alloy being largely used for this purpose. The wire is generally wound—doubled on itself—upon a wooden bobbin, and well soaked in paraffin-wax. This method of winding diminishing the self-induction of the coils to a minimum,

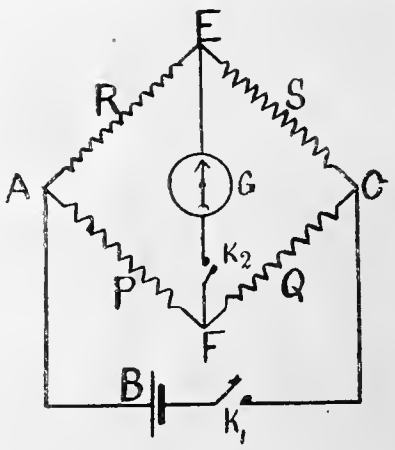

Fig. 65.

and the free ends of the coils are connected to separate brass pieces, as described under the heading of Post Bridge Box later on. By means of plugs, any desired resistance may be introduced into a circuit quite readily. Since these coils are usually wound with fine wire, none but weak currents should be sent through them.

The Method of Substitution.—By this method the conductor whose resistance is required is, placed in series with a sensitive galvanometer, and a source of constant electro-motive force. An ordinary Daniell's cell answers well. When

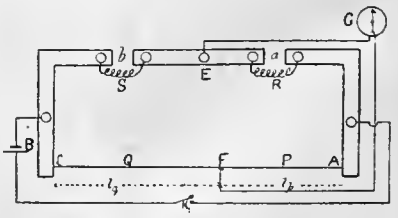

Fig. 66.

the galvanometer deflection is steady—that is, when the current is steady—the deflection is noted. The conductor of unknown resistance is then removed and replaced by a box of resistance coils, and sufficient resistance is introduced into the circuit by withdrawing plugs from the box to produce the same deflection as before, from which it is evident that the resistance so introduced will be equal to that of the conductor, which is required. If a number of determinations have to be made by this method, it is an advantage to use

a two-way switch, and to connect the conductor and resistance box as shown in Fig. 63.

In this figure, R represents the resistance box, x the conductor of unknown resistance, G the galvanometer, B the battery, and S the two-way

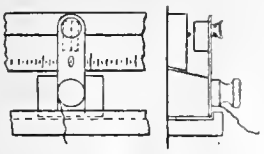

Fig. 67.

switch. The method of procedure is the same as that already given; but in this case it is not necessary to remove the conductor from the circuit. It is, of course, cut out of action by means of the two-way switch, and repeated observations may be quickly made to see if the battery has remained constant. The defect of this method is due to the fact that ordinary cells are not very reliable as regards their constancy, and it is advisable to take the mean of a number of read-

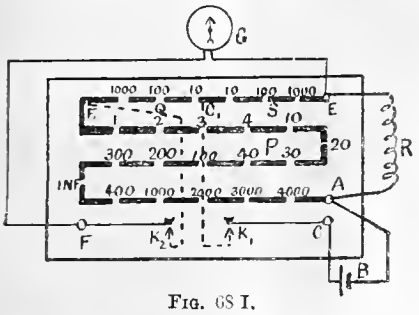

Fig. 68 I.

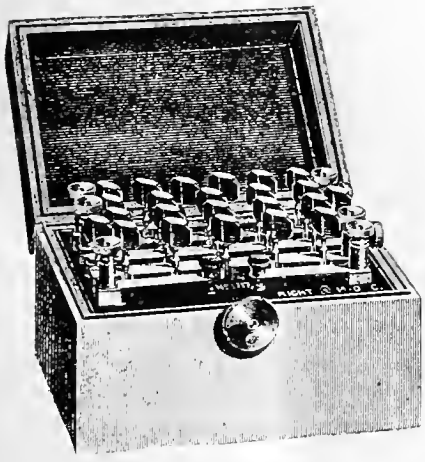

Fig. 68 II.

ings. If the galvanometer be very sensitive, it is often convenient to shunt it during the test.

Wheatstone's Bridge.—For everyday testing of resistances, where easy, rapid, and accurate determinations are required, the Wheatstone's bridge is employed. Wheatstone's bridge consists

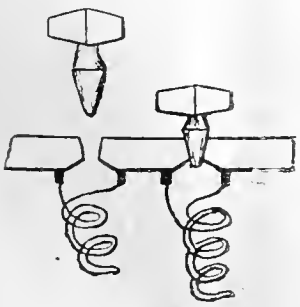

Fig. 69.

of a certain arrangement of adjustable resistances, and the principle of the method is very simple, depending upon the following elementary principles:—

(1) The fall of potential between two points in a conductor is proportional to the resistance of the conductor between the two points.

(2) If two conductors, A E C and A F C be connected in multiple arc between two points in a circuit, as in Fig. 64, there will be the same drop in volts along A E C as along A F C, and consequently two points, E and F, may be found, one in A E C and one in A F C, which have the same potential.

(3) No current flows along a conductor between two points at the same potential.

By combining these principles, an unknown resistance, R, may be determined in terms of a known resistance by adjusting the resistances P, Q, and S when arranged as in Fig. 64, so that the points E and F are at the same potential. From the figure it is evident that the current from the battery B divides at A, and unites again at C; and, as is well known, the proportion of the main current flowing along the two branches A E C and A F C depends upon the resistances of A E C and A F C. If, when we take the point E in A E C, the resistance of A E is R, and that of E C is S, and also that when the point F is at the same potential as E, the resistance of A F is P, and that of F C is Q; then if e is the drop in volts between the points A and C, e_1 the drop in volts between the points A and E, and between A and F, and e_2 that between the points E and C and between F and C, we shall have—

$$e = e_1 + e_2$$

$$\frac{e_1}{e} = \frac{R}{R+S} = \frac{P}{P+Q}$$

from which—

$$\frac{R}{P} = \frac{R+S}{P+Q}$$

also—

$$\frac{e_2}{e} = \frac{S}{R+S} = \frac{Q}{P+Q}$$

from which—

$$\frac{S}{Q} = \frac{R+S}{P+Q}$$

$$\therefore \quad \frac{R}{P} = \frac{S}{Q} \text{ and } R = P \times \frac{S}{Q} = S \times \frac{P}{Q}$$

P, Q, R, and S are the resistances of the conductors forming a *balanced* Wheatstone's Bridge, and from the relationship just determined we have means at hand of calculating the unknown resistance R of a conductor:—(1) When P, Q, and S are known quantities; or (2) When the resistance of one of the adjacent conductors to R—*i.e.*, P or S, is known, and the ratio of the other two is also known. The conventional way of representing Wheatstone's Bridge is shown in Fig. 65, in which the same letters are used as in Fig. 64. In practice a sensitive galvanometer, G, is inserted between E and F so as to ascertain when these points are at the same potential. When the four conductors P, Q, R, and S form a *balance or bridge*, each is known as an *arm of the bridge*, and the two forming the ratio $\frac{S}{Q}$ or $\frac{P}{Q}$ (as the case may be) are termed the *ratio arms*.

If S = Q, then R = P, and if P = Q, R = S. A moment's consideration also shows that these principles permit of several different ways of arranging the conductors so as to form a bridge, according as we may wish to adjust one or more of the resistances P, Q, S in obtaining the balance. Thus (1) both members of the ratio $\frac{P}{Q}$ may be varied until balance is obtained, whilst S remains constant, and (2) the ratio $\frac{S}{Q}$ may be maintained constant, and the value of P varied until balance is obtained. In this case the value of the ratio $\frac{S}{Q}$ is usually made unity, $\frac{1}{10}$ or $\frac{1}{100}$.

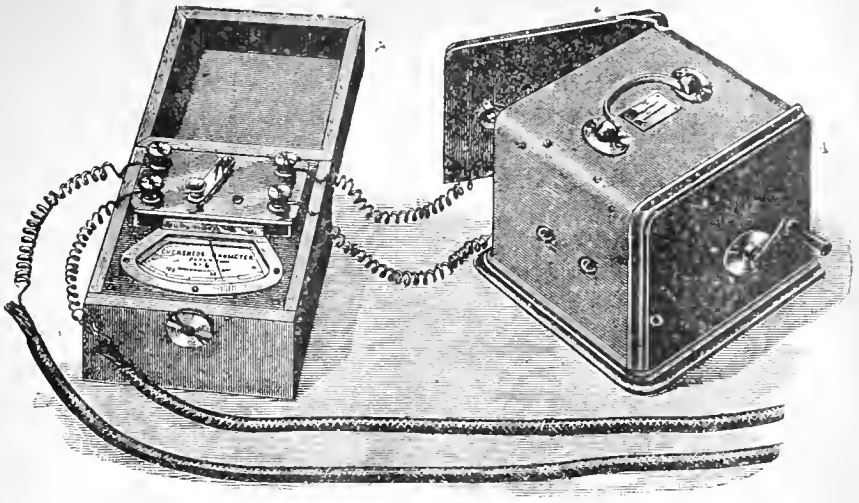

Fig. 70.

In practice, two forms of bridges are in common use, and these are constructed for working according to the conditions named in (1) and (2) above, and are termed respectively the *Mètre Bridge* and *Post Office Bridge*.

The Mètre Bridge.—A very convenient way of arranging the conductors forming a Wheatstone's Bridge, so that both members of the ratio $\frac{P}{Q}$ may be varied at pleasure, is shown in Fig. 66, and is known as the *Mètre Bridge* pattern, on account of a wire 1 mètre in length, and made of German silver or platinoid wire, being used for the ratio arms of the bridge. This form of bridge is easily and cheaply constructed, and if used in conjunction with reliable standard coils, permits of great accuracy. Three connecting pieces, A, C, E, of stout copper or brass bar (the two former being right-angle pieces), to each of which binding screws are soldered, as indicated by the small circles, are firmly fastened to a board about 42in. long and 9in. wide, the inner edges of the right-angle pieces being exactly 1 mètre apart. The German silver or platinoid wire is tightly stretched and soldered between A and C, so as to be exactly one mètre in length. Upon the board and under the wire is screwed a box-wood scale one mètre in length, and divided into centimètres and millimètres. The same letters are used in Fig. 66 as in Figs. 64 and 65, and contact is made with the mètre wire by means of a sliding key, K_2, which is free to move from A to C, so that the segments, into which the mètre wire is divided by the key at F, form the two resistances P and Q. The construction of the sliding key is shown in Fig. 67.

In using this form of bridge, the ratio $\frac{P}{Q}$ is varied by means of the key until balance is obtained, the actual position of F depending upon the ratio of R to S, which are two coils of wire inserted in the gaps a and b. The point F divides the metre wire into two sections, l_p and l_q millimètres in length, and since $l_p + l_q = 1{,}000$ millimètres, the ratio $\frac{P}{Q}$ may be written $\frac{l_p}{l_q} = \frac{l_p}{1{,}000 - l_p}$, resistance being proportional to length. Therefore if the value of S be known—

$$R = S \times \frac{l_p}{l_q} = S \times \frac{l_p}{1{,}000 - l_p}$$

Post Office Bridge.—The second form of Wheatstone's Bridge is the Post Office pattern, which practically consists of a box containing twenty-two standard coils and connections arranged so as to form a very compact, and at the same time, complete bridge. A plan of the arrangement is shown in Fig. 68 I., and the complete box in in 68 II. The free ends of the coils of wire, forming standard coils, are soldered to solid brass

pieces fixed to insulating material, and between the adjacent brass pieces there is a carefully formed conical recess, in which a stout conical brass plug with an insulating handle is inserted, as shown in Fig. 69. The coils are made of platinum-silver wire.

When the plugs fit the holes tightly, the resistance coils are practically short-circuited, and to place any coil in circuit the corresponding plug is removed. With this pattern of bridge the proportional or ratio arms, S and Q, each consists of three coils of 1,000, 100, and 10 ohms resistance respectively, and form the top row in the box. The ratio $\frac{S}{Q}$ is maintained constant and equal to unity, $\frac{1}{10}$ or $\frac{1}{100}$, according to the degree of accuracy desired, and balance is obtained by varying the value of P. The rheostat arm P consists of a series of coils having the following resistances, 1, 2, 3, 4; 10, 20, 30, 40; 100, 200, up to 1,000 ohms, from which any desired value from 1 to 11,110 ohms may be obtained by removing the plugs; thus, 376 would be made up as follows:—300 + 40 + 30 + 4 + 2. When the plug marked I N F is removed, infinite resistance is introduced, and that part of the circuit is completely broken. The battery and galvanometer are connected to the terminals A and C and E and F respectively; the keys K_1 and K_2 when closed, connect the pieces C and C_1 and F and F_1 together by means of the stout pieces of wire placed inside, and indicated by the dotted lines. The wire of unknown resistance, which has to be determined, is inserted between the terminals A and E. The method of using this form of bridge is as follows:—With the galvanometer shunted, determine the value of R to the nearest whole number by taking S = Q = 10. Then to the first decimal place, by taking Q = 100 and S = 10, and finally to the second decimal place, by taking Q = 1,000 and S = 10. In the final determination the galvanometer shunt should be removed.

Measurement of Very High Resistances.—Although the Wheatstone's Bridge permits of a very wide range of measurement—from 1 ohm to 100,000 ohms—there are many cases for which this arrangement is not applicable, such as, for instance, the determination of the insulation resistance of an electric light or power circuit, which, to be satisfactory, should come out in meghoms (millions of ohms). For these tests—the determination of insulation resistance—some form of portable testing apparatus is required, which usually includes a sensitive galvanometer, resistance coils, and a current generator, either in the form of a large battery or magneto-machine. Since extreme accuracy is not necessary, some form of an ohmmeter is mostly used, by means of which insulation tests may be quickly made, the insulation resistance being given directly in megohms by a pointer moving over a dial. An ohmmeter is an instrument for measuring directly high resistances, and it is so constructed that the position taken up by a delicately poised needle when working indicates the ratio of the *pressure* or P.D. between the ends of a conductor, and the current passing through the conductor. The ohmmeter was introduced by Ayrton and Perry, and, as improved by Mr. Sidney Evershed, is a very satisfactory commercial apparatus, and is much used. Furthermore, the whole testing set—consisting of a generator and an ohmmeter—is easily manipulated. The complete testing-set is shown in Fig. 70, and the construction of the ohmmeter will be understood from the following brief description and the diagrammatic sketch given in Fig. 71:—A and B represent two pairs of coils of wire fixed so that their axes are at right angles to each other, and the needle to which a light pointer is attached is pivoted at their centre. Coils A consist of many turns, whilst B is of much lower resistance; the two pairs of coils being connected in parallel as shown. It will also be observed that the resistance to be measured is connected in series with B, so that B may be termed the current coil, whilst the set A, which often has a high resistance, R, connected in series with it, may be looked upon as a shunt to the current coil.

In some of the earlier instruments the needle was a permanent magnet; but with these needles reversing the direction of the current through the ohmmeter impairs the accuracy of the instrument. In the latest patterns, therefore, the needle is made of soft iron, and is magnetised by the currents passing through the coils. To neutralise the effects of the earth's magnetism, a bar magnet is placed below the needle. For testing purposes, the current is supplied by a small magneto machine, which sets up a pressure of about 120 volts when the handle is turned from 60 to 70 turns per minute. This generator is contained in a separate box (see Fig. 70), and should be placed not less than 3ft. from the ohmmeter when in use; otherwise the needle will be affected.

The indications of the needle of the ohmmeter obviously depend upon the relative intensities of the magnetic fields produced by the two sets of coils, and since the intensities of the magnetic fields are proportional to the currents passing through the coils A and B, which in turn are inversely proportional to the resistances of the two circuits, it is clear that the deflection of the needle depends only upon the ratio of the resistances of the two circuits. The position taken up by the needle is, of course, that of the resultant direction of the two fields, one of which is a measure of the current passing through the current coil; and the other is a measure of the

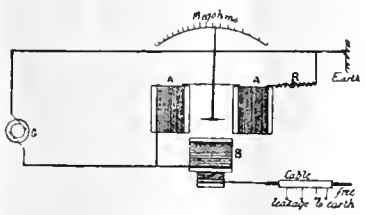

Fig. 71.

P.D. at the terminals of the instrument, and the ratio between the latter and the former is a measure of the resistance inserted. Thus, let—

r_a = resistance of the coils A.
r_b = resistance of the coils B.
C_a = current in the coils A.
C_b = current on the coils B.
R = resistance in series with the coils A.
x = insulation resistance of cable.
E = P.D. maintained between the terminals of the ohmmeter. Then—

$$C_a = \frac{E}{R + r_a}\ ;\ C_b = \frac{E}{x + r_b}$$

$$\therefore \frac{C_a}{C_b} = \frac{x + r_b}{R + r_a}$$

Now, the ratio of C_a to C_b determines the position of the needle; consequently the position of the needle depends upon the ratio of the resistances. To calibrate the ohmmeter, r_b is eliminated, so that the scale reading gives the value of the insulation resistance x.

Each ohmmeter possesses a two-contact switch. By placing the switch-arm on one contact the range is from 0·1 to 5 megohms (for one size of ohmmeter), and by placing it on the other contact the range is from 10,000 to 500,000 ohms.

To use this testing set, the + and − terminals of the generator are connected to the + and − terminals of the ohmmeter, and for finding the insulation to earth, one end of the main under test is connected to the *line* terminal of the ohmmeter, the other end being perfectly free and open, whilst connection is also made between the *earth* terminal of the instrument and a good earth. With all switches turned *on* and the lamps removed, the insulation resistance of that main to earth is given with very fair accuracy upon working the generator. The insulation resistance of the other main is likewise tested. For the test as to the insulation resistance between the two mains, the earth connection between the ohmmeter and the earth is removed, and is replaced by the end of the second main, the further ends of both mains being open and perfectly free.

(To be continued.)

MR. LIONEL CUST ON PORTRAITS.

MR. LIONEL CUST, C.B., director of the National Portrait Gallery, gave on Saturday afternoon at the Royal Institution, the first of two lectures on "Portraits." Dealing with the subject of portraits considered as historical documents, he inquired, if portraits were valuable as illustrating the history of families, how much much more valuable were they in illustrating the history of a nation? Since portraits might be regarded as historical documents, one would expect to find the nation treasuring up portraits as carefully as it had treasured up the records of its laws and plans and documents relating to military achievements. It was instructive to see what England had done in this matter. Henry VIII., Mary, and Elizabeth all employed eminent portrait painters. Indeed the Royal families were the early patrons of the art, and Holbein might be regarded as one of the historians of the reign of Henry VIII., for to him we were indebted for our knowledge of the personal appearance of that king's court. His portraits were absolutely indispensable to the historian of that age. The arrival of Vandyck in this country was the beginning of a new epoch in the history of portrait painting. He raised the art both historically and pictorially to a higher level. It was to him we owed our knowledge of the personal appearance of Charles I. and his family. With reference to the collection of portraits, private enterprise had done what the nation neglected. Mr. Cust next referred to the foundation of the National Portrait Gallery through the energy of Lord Stanhope, and the great additions made to it through the influence of the late Sir G. Scharf. He instanced the value of the collection from the historical point of view, and concluded by referring to the great aid afforded by portraits to education and historical research.

In his second lecture, delivered on Monday afternoon, Mr. Cust dealt with the subject of "Portraits as Monuments." He said that if inquiry were made into the strict sense of the word "monument," it would be found that it meant little more than a record or memorial, which should be an incentive to thought. Monuments mostly took form in architecture, sculpture, and painting. As an independent art painting was immeasurably younger than either sculpture or architecture. Having referred to the progress of art in Egypt, Greece, and Rome, he pointed out that Mediæval art portraiture was little used, as the art of that period was completely consecrated to God and the Church. But from the time of the Renaissance onward to the present day the statue and the bust had reigned supreme in monumental art. They were often more than mere portraits; they were works of art, and deserved to rank with the paintings of Titian and Holbein. It was not until the middle of the 18th century that the world of art began to recognise that the art of ancient Rome was a mere transcript from the Greek. One of the most unfortunate delusions which had beset portrait and artistic work for generations both in England and on the Continent had been the belief that Rome, and Rome only, was the Mecca for artists. The complete subjugation of art to the decadent sculpture of Rome was a great misfortune to the human race, and nearly proved its artistic ruin. Unless the marble bust had a place fixed for it, and unless there was some intention for its creation, it was one of the most useless and meaningless things that an artist could produce. Fortunately for London, most of its statues were in bronze. It was difficult for the sculptor ever to produce a real portrait: he could not go beyond certain limits in his art, especially if he were working in marble. As a mere portrait and nothing else the marble bust could seldom be successful. Bronze gave a much more satisfactory statue than marble. Sculpture in terracotta was a branch of the art which seemed to have fallen into a most unnecessary disgrace. By its use colouring could most usefully be brought into play. Portrait statues had before now been made of wood and coloured. Mr. Cust, in conclusion, dealt with memorial, official, and presentation-portrait paintings, pointing to the necessity for the exercise of care in the use of portraits for such purposes.

On Thursday afternoon in last week board schools erected in Nether-street, Beeston, Notts, were opened by Dr. Clifford, of London.

The Gildersome District Council has made application to the Local Government Board for sanction to borrow an amended loan of £2,500, for purposes of sewerage and sewage filtration works.

The subscriptions for the Wilmslow parish church restoration fund have reached a total of £1,143. The work of restoring this ancient Cheshire church is now being carried out, the chancel having already been dealt with. The restoration committee have purchased for the use of the parish the ancient Trafford Chapel, one of the most interesting parts of the fabric. This was the property of the trustees of Sir Humphrey de Trafford. The chapel is now being renovated, and it is afterwards to be furnished as a chapel for daily service. All the work is being done under the supervision of Mr. G. F. Bodley, A.R.A., of London.

BONDED WAREHOUSE, GLASGOW.—STUDIES OF ANIMAL LIFE.—"THE LAWN," COGGESHALL, ESSEX.—FONT COVER, COCKINGTON CHURCH.—STATES ASSEMBLY HALL, GUERNSEY.—"WOODNORTON," KING'S NORTON.—"COURT HEY," MOSELEY.—BUSINESS PREMISES, FRIAR STREET, READING.—INTERIOR OF THE CHURCH OF STA. MARIA, BELEM, PORTUGAL.

Our Illustrations.

BONDED WAREHOUSE, GLASGOW.

This building, which will add a striking feature to the commercial architecture of Glasgow, is at present in course of erection in Washington-street, for Messrs. W. P. Lowrie and Co., Ltd., the well-known firm of bonded warehouse proprietors and storekeepers. The warehouse occupies an area of 1,825 square yards, with a frontage to Washington-street of 89ft., and is six stories in height. On the street floor are the blending and bottling departments, washing room, loading banks, Excise office, &c. The remaining flats will be used for storage in bond. The Washington-street front is built with red Corneockle stone, and the north wall with terracotta brick from the works of the Scottish Terracotta and Metallic Co., Ltd., with Corncoekle stone dressings. The architect is Mr. Alexander Gardner, 209, St. Vincent-street, Glasgow.

STUDIES OF ANIMAL LIFE TREATED FOR DESIGN.

These National Silver Medal drawings by Mr. John J. Brownsword form part of the series of drawings of birds and beasts which we commenced with the opening number of the Building News for the New Year. The present sheet of grandly-plumaged pheasants, the lyre-bird of Australia, and birds of Paradise furnish colour as well as suggestive decorative forms for the artist in applied design. Shown as these graceful creatures are in the accompanying plate, truth to nature is observed, though the draughtsman has somewhat skilfully arranged his subjects for their special adaptation to the purpose in view, and we can only regret that the limitations of monochrome printing do not allow us to give the colours of the originals.

"THE LAWN," COGGESHALL, ESSEX.

A new half-timbered front has recently been added to this house, the residence of Mr. G. F. Beaumont, F.S.A., which is a 16th-century building. The brickwork has been executed in 2in. red bricks, specially made, and the doors and windows have moulded Bath stone dressings. The principal entrance has carved stone spandrels and rich mouldings, and linen-fold panelled door. All the timber work has been executed in English oak, the frieze and barge-boards being richly carved in foliated pattern, with the following inscription on scrolls entwined in the foliage of the frieze: "Haec Domus anno sexagesimo Victoriæ Reginæ renovata est." The work has been carried out from the designs of Mr. P. M. Beaumont, A.M.I.C.E., architect, of Maldon, by Mr. Sach, contractor, Coggeshall. The carving is by Mr. W. B. Polley, of Coggeshall.

FONT COVER, COCKINGTON CHURCH.

This interesting old carved font-cover in the Church of St. George and St. Mary, Cockington Court, Devon, has recently been restored. It is richly carved, and when needed for baptism, four cants of the octagon open like a tryptich. For many years this cover lay about the church in a number of pieces; but on the Rev. James Henning being recently appointed vicar, one of his first acts was to gather the fragments together and send them to Messrs. Harry Hems and Sons, sculptors, of Exeter, who have carefully put the remains together, and conservatively restored the decayed and missing parts. All the original old hammered iron hinges have been reused.

PROPOSED STATES ASSEMBLY HALL, GUERNSEY.

This design was submitted in the early part of last year by Mr. Arthur Ardron, F.R.I.B.A., of 8, Delahay-street, Westminster. Nothing has transpired as to the decision of the promoters, although rumour has it that a second competition is to be undertaken. The principal floor is on the level of the floor of the present Upper Court in St. James's-street. Owing to the considerable fall of ground from the new street to the lower end of St. James's-street, the entrance to States of Assembly Hall is placed at the lower level, and would be approached by a flight of steps leading into a spacious vestibule or hall. Out of this hall are the cloak-rooms for ladies and gentlemen, to be available more particularly when the assembly hall is used for public meetings, &c. This hall is capable of seating 400 persons, exclusive of the gallery. A rostrum is provided at the eastern end, and behind this, fronting the street, is placed the president's retiring room, with ante-room adjoining. At the opposite end of the large hall provision would be made for forming two committee-rooms by means of movable partitions, as shown by the plan. Communication is given to the present upper court from the corridor, and convenient of access for each floor. A gallery capable of seating about 100 persons is provided. This is placed over the committee-rooms, approached by a wide staircase and corridor. An additional approach and exit is provided from the staircase opposite the St. James-street entrance, and separate lavatory accommodation is provided for ladies and for gentlemen. The hall for the States of Deliberation is placed at the corner of St. James's-street and the New-street, and is designed to give ample seating accommodation for the 50 members. The approach is by a flight of steps in the tower over entrance leading into wide vestibule and inner hall, &c. A lavatory and cloakroom is provided on the same floor, with additional accommodation on the floor above. A large committee-room is shown on the first floor. This room would also be available as a supper-room when required. A small gallery for the use of the public to this hall is provided at one end of the hall, approached from St. James's-street by a stone staircase. On the basement floor provision is made for two sets of offices with separate approach from St. James's-street. These could be let off to solicitors or others without in any way interfering with the public buildings. The caretaker's house is in the basement, under Deliberation hall, and contains parlour, kitchen, scullery, and three bedrooms. The design of the building externally is Italian Renaissance freely treated. The tower is placed over the main entrance in St. James's-street at the highest level of site, so as to be made as conspicuous as possible without entailing extravagant expenditure. A four-way dial clock is shown, and also a small projecting balcony over principal entrance, which could be used for speaking purposes when the elections take place. The buildings would be faced entirely in granite, the mouldings, &c., would be kept as plain as possible in detail. Grey granite to be used for the dressings, and red and blue granite for the general facings; the roofs to be covered with red tiles. The cost of the building was limited to £15,000.

"WOODNORTON," KING'S NORTON.

This residence, for Mr. Theodore Pritchett, is situated in the New-road, King's Norton, the site sloping towards the south, the best rooms being placed so as to secure views of the undulating and wooded scenery for which King's Norton is so famed. Besides the three reception-rooms and usual accommodation, there is a billiard-room in the basement. The builder was Mr. Harford, of King's Norton, and the architect Mr. De Lacy Aherne, of King's Norton and Birmingham.

"COURT HEY," CHANTRY ROAD, MOSELEY.

This house, for Mr. J. Price (city surveyor of Birmingham) is situated in the Chantry-road, Moseley, and has a pleasant outlook on to the ornamental water and grounds of Moseley Hall. The architect was Mr. De Lacy Aherne, of Birmingham.

BUSINESS PREMISES, FRIAR STREET, READING.

This building, now in course of erection, is the Friar-street front of A. H. Bull's (Limited) extensive premises in Reading, which occupies a site extending from Broad-street to Friar-street, and when completed will form an arcade through a well-lighted shop from one street to the other. The upper floors are planned for the accommodation of assistants. The front consists of silver-grey bricks and Bath stone; the shop-front is of red and grey granite, and the roof is covered with Westmoreland green slates. The contract is let to Mr. Margetts, of Reading, and the architects are Messrs. Millar and Nasmyth, of Reading and Oxford.

CHIPS.

The new railway-station at Leigh, Lancs, was opened on Sunday. The platforms, booking-offices, &c., have been completed some time, but the new approach road, owing to a dispute between the town council and the London and North-Western Railway Company, was only connected with Princess-street last week. The station has cost £17,000.

A new Presbyterian church-hall erected at the corner of the Alcester and Chantry roads, Moseley, by the local Presbyterians, was dedicated on Friday night. The hall, which has cost between £1,200 and £1,300, has been built from designs by Messrs. De Lacy Aherne and McRewan, of Colmore-row, Birmingham.

Works for the production of silicate bricks for use in steel-smelting furnaces and kindred purposes have been erected at Braehead, near Baillieston, Lanarkshire, by the Scottish Silicate Brick Company. Such bricks have had to be procured hitherto almost entirely from the Midlands and South Wales.

A new organ, which is in course of erection by Messrs. Lewis and Co., of London, at New-road Congregational Church, Bury, Lancs, is to be opened on Thursday in next week.

Mr. J. J. Colman has purchased from the governors of the Jenny Lind Infirmary the site on which the old hospital stands, and is converting it into a model playground for the children of Norwich.

The churchyard cross at Melbury Bubb, which for many years has consisted of a decayed base only, the shaft having been lost, has just been restored by Messrs. Harry Hems and Sons, of Exeter. The new structure is of Portland stone. From the base rises an octagonal shaft, and on the upper portion in the front is a representation of the Crucifixion. On the reverse side is the figure of the Virgin Mary and the Child Jesus.

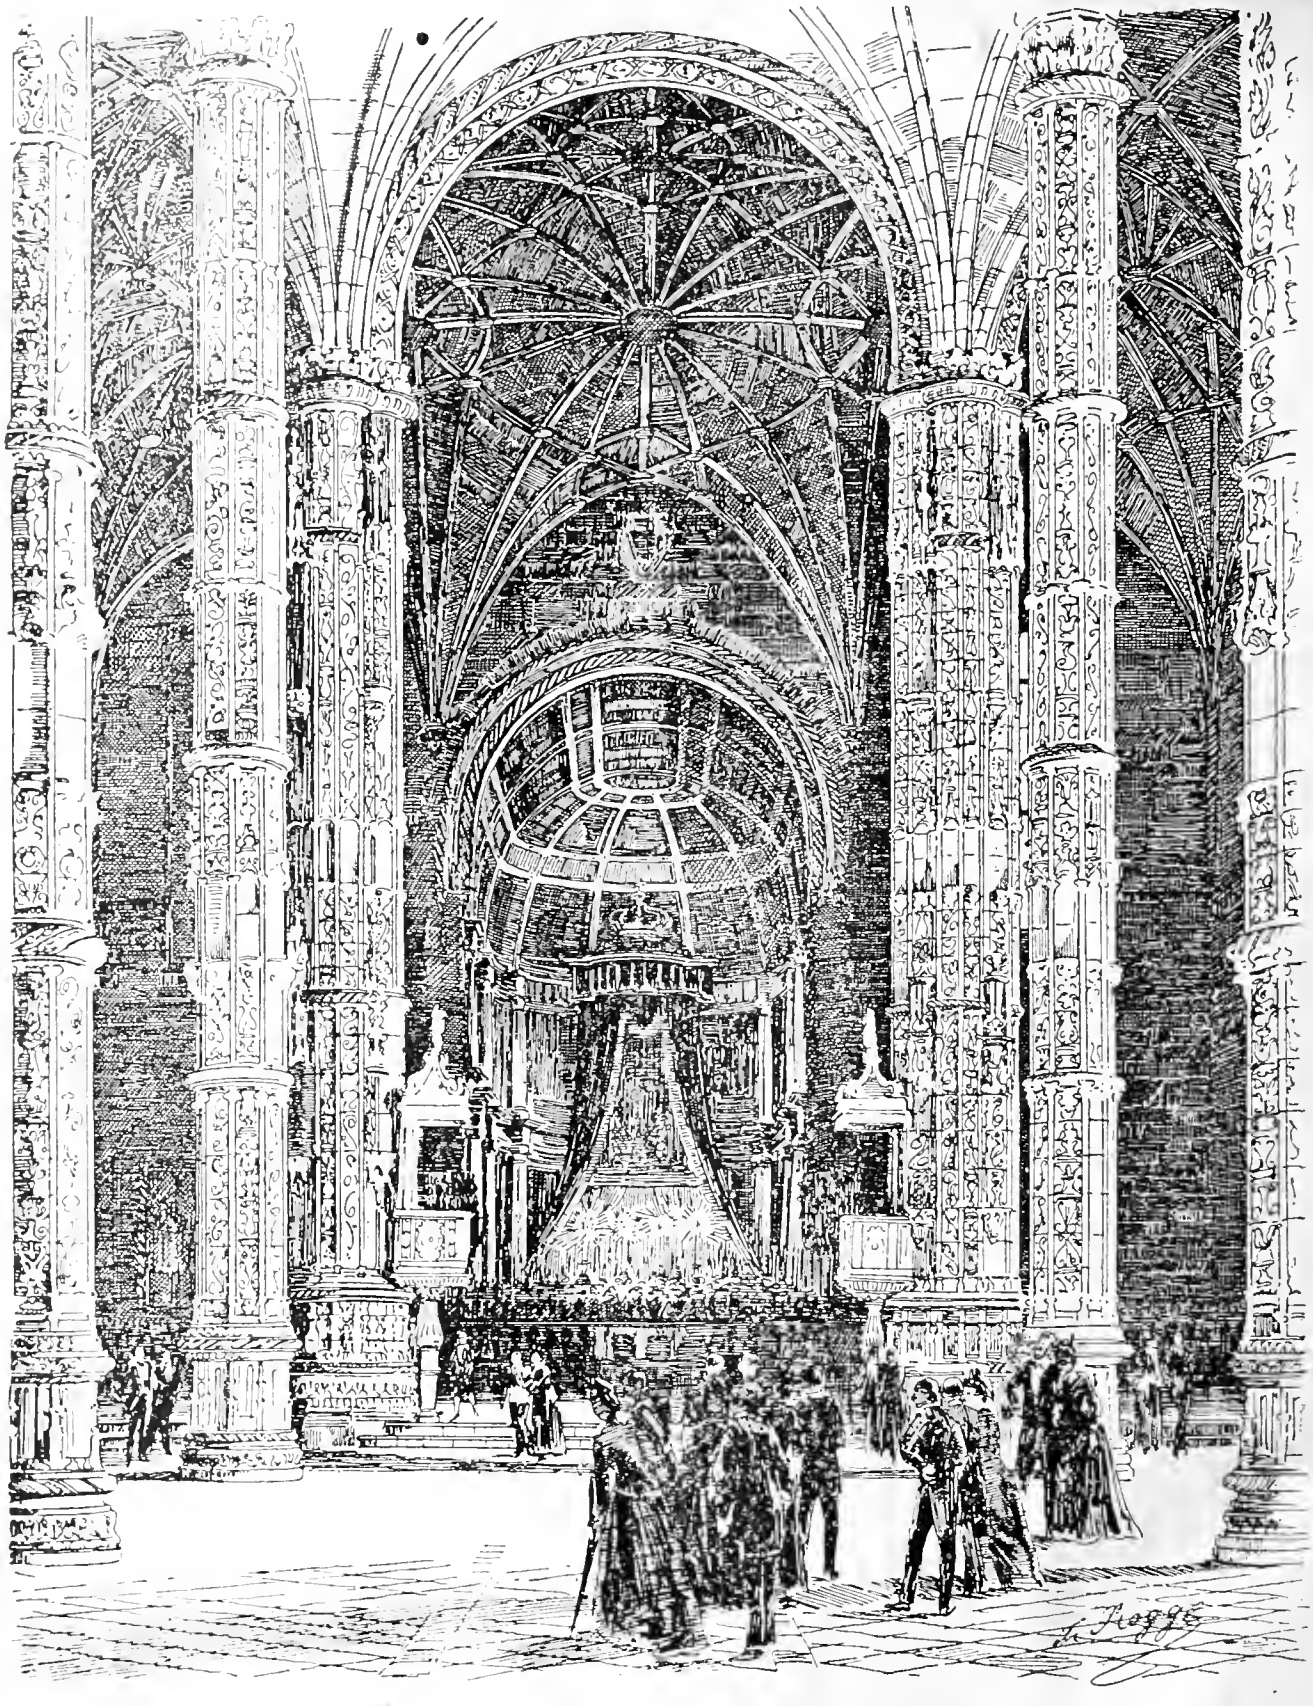
This is the 50th year of the existence of Bloomsbury Chapel. It was in December, 1848, that the building, erected by the enterprise of Sir Morton Peto, was opened for public worship. It was the first Nonconformist chapel in London to be built in a prominent position on a leading thoroughfare. It has been decided to thoroughly modernise the building by reseating it, installing the electric light, and providing new heating and ventilating arrangements, and the total cost is estimated at about £2,500.

The well-known City church of St. Mary the Virgin, Aldermanbury, was reopened on Wednesday by the Archdeacon of Loudon, after restoration and reparation from plans by Mr. Eric Collins, architect. The works include the introduction of the electric light.

Of the 91 applicants for the borough surveyorship of Douglas, the following will come before the Committee of Selection for final decision:—Messrs. A. E. Prescott, deputy borough surveyor, Luton; H. J. Weaver, deputy city surveyor, Gloucester; and T. L. Lewis, assistant surveyor, Bristol.

The Andoversford and Stratford-on-Avon Railway Bill has successfully passed through the House of Commons Committee, and now awaits the decision of the House of Lords. The scheme which the Bill seeks to authorise will provide a direct route between Southampton and Birmingham via the Midland and South-Western junction system.

The Libraries Committee of the Liverpool Corporation have adopted plans prepared by Mr. T. Shelmerdine (city surveyor) for the new library proposed to be built at the corner of Windsor-street and Upper Parliament-street, Toxteth. The building will be of brick and stone in the Renaissance style. It was resolved to recommend the Council to invite tenders for carrying out the work.



From *Oesterr. Monatschrift f. d. öffentl. Baudienst.*

Interior of the Church of Sta. Maria, Belem, Portugal.

INTERIOR OF THE CHURCH OF STA. MARIA, BELEM, PORTUGAL.

THE arcade of this lofty and ornate building is very similar in detail to the well-known cloister in the monastery of St. Jerome, also in the village of Belem, on the outskirts of Lisbon. A drawing of this last-named work appeared in our pages for Jan. 2, 1891, when an account of the building was given. The detail is florid, like that in the cathedral at Braga; but the treatment of the shafts in this church of St. Maria, as will be seen by the accompanying illustration, seems to afford a suggestive idea for the employment of terra-cotta successfully. The two pulpits give an additional picturesqueness, but the high tester hanging over the altar is hideous and dreadfully out of scale.

The church has been cleared out of many of its old fitments and furnishings, while the repair and so-called restoration of the fabric have not enhanced the historic charm of this interesting building.

A clock-tower is about to be built at Skegness, from plans by Mr. E. Winter, of Egremont.

Memorial stones of a new Sunday-school in connection with Wesley Church, Higher Tranmere, Birkenhead, were laid on Monday at the rear of the chapel. The new buildings will cost £3,600.

At a meeting of the Worcestershire Standing Joint Committee, on Saturday, a tender from Mr. S. Cheese, of Worcester, for the erection of a police-station at Stirchley, King's Norton, was accepted, the amount being £3,050.

Building Intelligence.

Aberdeen.—Preliminary arrangements having been completed, actual work has been commenced this week in the internal decoration of the Trades Hall, Belmont-street, by a series of frescoes. The platform in the hall is recessed from the main hall, and the portion of the wall to be filled in with these frescoes is the part at each side of the platform facing the audience. This part of the wall is formed at each side of the platform into an oblong panel 12ft. high by 10ft. wide, and is surmounted by two smaller panels, the inner panel of each pair being triangular-shaped, occupying the spandrel of the arch over the platform. The artist is Mr. R. Douglas Strachan. The subject chosen for treatment is that of "Labour," and the general idea running through the design as a whole is the progress which labour has undergone. Looking on the lefthand large panel one sees an Eastern group of merchants bargaining over their cargoes, and attended by slaves. In the corresponding panel on the right-hand side is illustrated "Modern Labour." The background, in this case, is largely filled in with mills and factories. A triumphal car, on which the various industries are depicted—agriculture, engineering, textile work, &c., while the arts of music and painting are portrayed in figure. On the left hand of the picture appears a group of workmen—blacksmiths, builders, engineers, &c., engaged in typical occupations; while a group on the right hand are engaged in operations connected with the arrival of a vessel from distant parts. In the four smaller panels figures of "Electricity," "Steam," "Textile Industry," and "Building" are portrayed in monochrome, and the series is completed by the representation, at the spring of the arch, of the lion rampant of Scotland on one side, and the arms of Bon-Accord on the other. Designs have also been drawn up by Mr. Strachan for the decoration of the three large panels in the ceiling of the hall.

Bradford.—The restoration of the Bradford Parish Church is being proceeded with rapidly, and the citation for the faculty for additional alterations were formally posted on Sunday. It has been resolved to open the recently-discovered "squint" into the church on the north side of the chancel, and that the priest's chamber will be rebuilt as muniment rooms, so that this quaint feature will be preserved in in its original form. The total amount now available for the restoration fund, including the Fawcett gift and the Bardsley memorial, is £4,450. The outlay was originally estimated at £6,000; but it will now exceed that sum.

Bury, Lancs.—The foundation-stone of a Baptist chapel was laid in Tenterden-street on Sunday. The buildings are in the 14th-century style, and are being carried out with Haslingden Grane bricks and Greetland stone dressings to all windows, doors, quoins, and plinths. The principal front of the chapel has a large gable with central Geometrical window, and the buttresses have turret terminations. At the entrance there is a porch with a flight of stone steps. The chapel is divided into a nave 42ft. by 34ft. 6in., with transepts 32ft. 6in. by 22ft. 6in.; baptistery, 26ft. 6in.; and two vestries, each 16ft. by 14ft. The sitting accommodation provided is for 500 persons. The interior fittings will be of varnished pitch-pine, and the floor will be laid with wood blocks. The roof will be open, and ceiled between the spars, and covered with Welsh slates. The school consists of central hall, 49ft. 8in. by 31ft., surrounded by classrooms each 16ft. by 14ft., with arrangements for enlarging central hall. The interior fittings will be all of pitch-pine, the floor being boarded. The architect is Mr. Thomas Nuttall, of 20, Market-street, Bury, and the building is being erected by Mr. Charles Brierley, contractor, of Fishpool, Bury.

Glasgow.—The new municipal baths and washhouses in Kay-street, in the Springburn district of Glasgow, which have been in process of construction for some time, were opened on Monday. Occupying a site some 2,000 square yards in extent, the new baths are the most completely equipped of those as yet erected by the corporation. They include a swimming pond of the usual size 75ft. by 30ft., attached to which are dressing-boxes, foot-baths, spray-rooms, &c., at each corner, and a gallery overhead for spectators, the dressing boxes being built on a new principle, which will preclude the appearance of the rot which has hitherto been so destructive in these establishments: 15 first-class and 13 second-class hot baths for men, and five hot baths for women; whilst the washing-house contains 34 stalls. Instead of the usual timber, the swimming-pond roof is carried by steel principals. Mr. A. B. Macdonald, the city engineer, prepared the plans for the building.

Holbeck, Leeds.—The third group of public baths erected by the Leeds Corporation were opened on Saturday. They are situated in Holbeck-lane, near the Holbeck railway station. Built of pressed bricks, with stone dressings, the structure, like the baths in Kirkstall-road and Union-street, is in its central portion three stories high, with a one-story wing on each side. The cost is about £8,500. Mr. Walter Hanstock, architect, of Leeds and Batley, prepared the designs.

Kidsgrove.—The want of public buildings at Kidsgrove has been long felt, and the deficiency has been supplied by the urban district council, who have erected a suite of buildings on a site given by Messrs. R. Heath and Sons. The buildings have been erected from the plans of Messrs. Wood and Hutchings, of Tunstall and Burslem. Mr. C. Cope, of Tunstall, has been the contractor, the amount of the accepted tender being £2,034, in addition to which the furniture and fittings will cost nearly £400 and the clock £120, other expenses bringing up the total to about £2,700. The style of the buildings is Free Renaissance. They are of red brick with stone dressings, and are covered with red tiles. The clock tower has been carried to a considerable height. The clock, which strikes the hours, and is by Messrs. Smith, of Derby, has four dials, and will be illuminated at night. The principal room, which is provided with a gallery, will accommodate about 700 people, and there is accommodation for a police-court, council chamber, committee-rooms, ante-rooms, reading-room and library, whilst cloak-rooms for ladies and gentlemen are also provided.

Leeds.—The builders of Leeds are having a busy time. In all the outlying districts row upon row of new dwellings are making their appearance. Indeed, if the present rate of erecting houses continues for another 40 or 50 years, large though the area of the city is, it will be quite built up. A feature of this development is that the majority of these houses are spoken for long before they are ready for occupation, proving that the supply of new dwellings is not in excess of the demand. The fact is, the population of the city is rapidly growing. About sixty more births are recorded every week than deaths, which in itself means an addition to population of over 3,000 a year. The arrivals from other towns are even more numerous. Fully double the number of full removal vans come to Leeds than go out, and, of course, the new-comers have to be housed. At the meeting of the Corporation Building Clauses Committee on Friday, the number of plans submitted for new houses and business premises, and for alterations to existing structures, was 126, establishing a new local record. The guardians of the Leeds Union are about to erect at the workhouse, Burmantofts, new imbecile wards. The pavilion plan has been adopted—a building for males on the one side, another for females on the other side, and an administrative block between, the whole connected by covered corridors. Accommodation for over one hundred patients will be provided. The administrative department will be of one story, comprising receiving and inspection wards, rooms for the medical officer, waiting-rooms, and padded-rooms. Adjoining the kitchen will be the dining-hall, and the two portions allotted to the male and female inmates will be separated by a folding screen. The male and female attendants will have separate mess-rooms, adjoining the kitchen. The pavilions on the right and left will accommodate 14 imbeciles and 11 epileptic patients of each sex on the ground floors, and 34 imbeciles of each sex on the first floors. Each pavilion will be provided with bathrooms, &c. There will likewise be day-rooms. For the attendants there will be, on the second floors of the pavilions, bedrooms and sitting-rooms, with bathrooms. About £14,000 is the estimated cost. The contractor for the excavation, the bricklayer's, mason's, and joiner's work is Mr. Wm. Airey, of Servia-road; for the slater's work, Mr. T. C. Heaviside, Roundhay-road: for the plumber's and glazier's work, Messrs. Braithwaite and Co., Swinegate; for the plasterer's work, Messrs. Wheater Bros., Calverley; and for the painter's work, Messrs. Roylance and Horseman, St. Mark's-road. The plans have been prepared by Mr. J. Mitchell Bottomley, Albion-street, and Mr. Prentice is the clerk of works. The ceremony of laying foundation-stones took place last week.

Macclesfield.—At the Chester Consistory, on Friday, the vicar and wardens of the church of St. Michael, Macclesfield, were granted permission to make extensive alterations in the church, the cost of which will be about £20,000, which will be defrayed by voluntary contributions. The alterations include the taking down of the nave and aisles of the church and the rebuilding of the same, the lowering of the floor of the nave 12in., the restoration of the Savage and Legh chapels, the formation of the Savage chapel into a morning chapel in lieu of the present one, the conversion of the Legh chapel into a baptistry, the rebuilding of the south porch, the removal of the existing roof over the chancel and the substitution of a new one, the rearrangement of the chancel seats, the restoration of the tower, and the building of a detached vestry.

Walworth.—The ceremony of opening the public baths and washhouses, which occupy the site of the old dust depot, Manor-place, Walworth-road, took place recently. The building has but one frontage, 284ft. long. The centre portion is three stories in height, having a high-pitched roof, surmounted by a domical turret. At the eastern extremity of one of the two wings is a tower furnished with a clock having three illuminated dials. The public laundry and ladies' swimming-bath are at the extreme ends of the frontage. Renaissance freely treated is the style. The front is faced with red bricks, and the columns, cornices, architraves, corbellings, and other embellishments executed in buff terra-cotta. The men's first-class swimming-bath has a water area of 120ft. by 40ft., designed to contain 157,000 gallons. There is also a men's second-class bath, 144ft. long by 35ft., possessing a water capacity for 164,896 gallons. Messrs. E. I'Anson and Son are the architects, Messrs. Balaam Bros., the builders, and Messrs. Clarke and Sons, engineers. The vestry agreed to a loan of £33,000 in May, 1894, to carry through the work.

CHIPS.

The new schools, Llangollen, are being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators, and special inlet tubes, the same being supplied by Messrs. E. H. Shorland and Bros., of Manchester.

An inquiry under the Light Railways Act was opened on Friday afternoon at Beaumaris for the consideration of the project to construct a light line between Llanfair, P.G., on the London and North-Western Railway system, and Beaumaris. The estimated cost is £40,000.

At a sale of freehold building plots at Willesden Green, on March 29, an acre and a half of land realised £3,056. A few years ago similar land in the locality was selling at from £500 to £1,000 an acre.

The 25th voluntary pass examination of candidates for the offices of municipal engineers and surveyors to district councils, carried out by this Incorporated Association Municipal and County Engineers, was held at the Institution of Civil Engineers, by the kind permission of that body, on Friday and Saturday, the 1st and 2nd inst. There were 49 entries for this examination, the written portion of which was taken on the first day. The whole of the second day was occupied with the *viva-voce* portion of the examination.

On Saturday afternoon a demonstration took place in Newton Heath to celebrate the opening of the Newton Heath new premises of the Failsworth Industrial Society. The site is at the corner of Oldham-road and Church-street, and has cost £4,000. The buildings have cost about £14,000, and have been designed by Mr. F. W. Dixon, architect, of Manchester and Oldham. They cover an area of 850 square yards.

At a meeting of the creditors of William Harrison Gray, late borough surveyor of Tewkesbury, it was stated by the official receiver (Mr. Charles Scott, of Gloucester) that the unsecured liabilities were £2,355, fully secured £1,160, and partly secured £100. The debts included money-lenders' claims for £327. Against these liabilities were assets consisting of the household furniture and effects, valued at £147, horse, harness, &c., sold at £17. Other small assets had not yet been realised. The estate was left in the hands of the official receiver.

CHEAP PAINTS AND PIGMENTS.

THE demon Cheapness has entered the hearts of manufacturers of paint and pigments, and, as a consequence, much of the stuff sold for painters' use is spurious. The oil used in grinding the pigment may be a thickened oil or "substitute" for the genuine linseed oil. The thinning vehicle, instead of being honest turpentine, is a make-believe of some hydrocarbon fluid, such as one of the series of turpenes or a mixture in which fluid paraffin largely enters. The pigment itself may be largely adulterated with barytes, gypsum, kaolin, or some other adulterating body which is destitute of all the qualities of a pigment. With such poor materials, it is utterly impossible to produce a first-class job. It is not the writer's intention in the present paper to show how to ascertain the purity or otherwise of the materials used in painting. That subject requires a separate article to itself. What is purposed to do in this paper is to explain the cause of the ill results obtained by the use of bad, impure, or poor materials, and, at the same time, to discuss the chemical reactions that are caused in a coat of paint as ordinarily composed. In our last article on "A Coat of Paint," the actual practice observed in painting a first-class job—on wood—was considered. In that article it was presumed that the materials used were of the best. Let us now consider the case of using inferior (or ordinary) materials, when we shall note many causes of various vagaries exhibited by paints. In the first place, let us consider the knotting compound that has been used. All painters must be familiar with patches of dry paint exhibiting themselves on a wooden painted surface some time after the paint has dried and hardened. This dry patch plainly indicates the position of the knots in the wood, as if the patch were painted in another coloured paint. Such dryness in the coat of paint is caused by the quicker drying of the knotting compound that has been daubed over the knots. If it has been a shellac knotting compound, that will dry at a much quicker rate than the coat of paint, and consequently become dry and hard when the paint is still moist. If the knotting compound has been one composed of litharge and linseed oil, that also will be a very quick-drying compound, and, therefore, by drying at a quicker rate than the surrounding coat of paint, will exhibit its presence in dry patches. Practically there is no remedy for preventing these dry patches, but they can be partially obviated by laying on a little manganese oleate (linseed-oil varnish). When the patches first begin to show themselves, the oleoresinous fluid will partially combine with the knotty compound, and therefore, by drying with it, cause the knotting compound to dry with a gloss or shine, like the coat of paint. Too much of the linseed-oil varnish should not be used, or it will have the reverse effect to that desired—viz., it will dry with a varnish-like gloss, and so exhibit shining patches.

"Manganese" linoleate (sometimes called manganese varnish, but more frequently called linseed-oil varnish) is prepared by heating raw linseed oil with borate or sulphate of manganese until the fluid has a varnish-like consistence. Such fluid will dry with a tough, elastic, varnish-like skin; but as it does not contain any hard rosin, it will, if laid on paint before the latter is quite hard, more or less sink in or unite with the paint, and thus produce the effect of the paint having been compounded with a varnish vehicle. This linseed-oil varnish, in fact, is one of the best vehicles to use in grinding up a pigment.

Let us now consider the case of an adulterated pigment. White-lead is most likely to be adulterated with barytes, gypsum, kaolin, chalk, or silica. None of these substances have any qualities that fit them for use as a pigment.

Barytes is the sulphate of barium. It is obtained as a native product by grinding up heavy spar to a fine powder, or else by precipitating the sulphate of barium by the addition of sulphuric acid, or an alkaline sulphate to a solution of a barium salt. The native variety is of a very crystalline nature, and when ground up in oil is utterly destitute of body or covering power—that is, the compound of oil and ground heavy spar will not hide the colour of the surface on which such compound is spread. It is, in fact, translucent, and therefore worthless as a paint. The artificially-produced sulphate of barium is not quite so destitute of body (it is, in fact, sold and used as blanc fix in water-colour and distemper painting); but in oil it is semi-translucent. The object of using this substance as an adulterant to white-lead is to increase the weight of the latter so that the (so-called) white-lead can be sold at a cheap or low price. Barytes, native or artificial, is a very heavy body, and consequently a pound of pure white-lead and a pound weight of a white-lead adulterated with barytes will not be equal bulk for bulk. It will be readily granted that as the barytes is destitute of body, that when a comparison is made between a genuine sample of white-lead and one containing barytes, that the latter will not cover so completely a space as large as the pure sample will, or, in other words, 1oz. of a pure white-lead can be spread out over a larger area than the same weight of a sample adulterated with barytes, because the latter, to enable it to completely obliterate the surface on which it is laid, will require to be laid on in a thicker coat than the former.

In a subsequent article the writer will give instructions for easily and readily making comparative tests of the quantity of pigments used in common painting.

Gypsum is also a sulphate, being the sulphate of calcium, and this body is also found as a native product, and likewise produced artificially. The native variety, when calcined and dried, is known as plaster of Paris. In its raw state it is called terra alba. Gypsum is similar to barytes in being destitute of body or covering power, but it is slightly more unctuous, or exhibits a slightly better power of combining with the oil vehicle when ground up therewith. Gypsum is not specifically so heavy as barytes; but it is used for a similar purpose, and exhibits the same effects—viz., want of body or power of obliterating the colour of the surface on which it is laid. Pigments with either of these two bodies mixed with them work livery under the brush when old.

Kaolin is a clay or silicate of aluminum. It is the kind of clay that is employed in porcelain manufacture, it having greater unctuosity or power of combining with oil; but it is semi-transparent, and therefore lessens the opaqueness of the white-lead with which it is mixed.

Silica is quartz or flint ground up to a very fine powder; it is crystalline, and, therefore, has no power of combining with the oil vehicles, and consequently a mixture of silica and oil is just as effective in covering up the surface of any material as a mixture of oil and sand would be. All the above adulterations are substances which are perfectly inert towards the other compounds of a paint; that is, they do not suffer themselves, nor do they engender chemical reactions in the paint, but as they do not possess any covering power, their presence in the paint is undesirable, and practically a fraud against the purchaser. Anyone who takes the trouble to think over the matter will conclude that it is far better to pay a fair price for a genuine article that does its work well than a lower price for an article which will not cover half as much space. The presence of this body in white-lead, or in any other pigment for that matter, cannot be justified under any pretext whatever.

In the case of chrome yellow, gypsum is a very frequent adulterant—in fact, most manufacturers of these lead chromes maintain that a yellow chromate of lead cannot be produced without the addition of gypsum, or some other white base, in which to precipitate the chromate of lead. The writer emphatically denies this assertion, as he has, and can, always produce any of the commercial tones of yellow lead chromates without the aid of any adulterative body—simply a solution of a salt of lead and a solution of chromate or bichromate of potash or of soda. However, this is not the place to discuss such questions; but as the assertion is so generally made, it may, perhaps, be contended that the presence of gypsum or barytes in yellow lead chromes is not an adulterant. In any case, however, the presence of either of these bodies reduces the staining power, and also the covering power of lead chromes, likewise their unctuosity. But there is one thing to be said in favour of the presence of either of these bodies, and that is that the stability or durability of the yellow chrome is increased by their presence. This is so because chromates of lead readily combine with the linseed-oil vehicle with which they are ground up, and by uniting therewith, form a linoleate of lead (a lead soap, which is soluble in water). Now, the presence of the inert bodies (gypsum or barytes) lessens the formation of the lead soap, and consequently, increases the permanency of the colour. Chalk, whiting, or china clay, however, are positively injurious to the colour, as the alkalinity of the two first bodies chemically reacts on the yellow chrome, and tend to convert it more or less into a brown colour. Moreover, chalk or whiting will not unite or grind up well with linseed oil, except to form a kind of putty, and thus render the chrome yellow lumpy in working under the brush. Likewise, chalk or whiting, being a carbonate of a metal (carbonate of calcium), it is liable to be decomposed by the action of an acid on the colour, whence the carbonic acid gas compound of the carbonate escapes as a gas, oxide of calcium being left behind. This oxide is caustic and alkaline in its action, and thence causes a darkening of the yellow colour: although a mineral or vegetable acid is not likely, in the ordinary course of events, to come in contact with the yellow paint, yet acids are likely to be brought into contact with the yellow pigment, because as the chromate of lead unites with the oil vehicle to form linoleate of lead, there are certain fatty acids eliminated from the oil which chemically react on the carbonate (chalk or whiting) that is in the adulterated pigment. The presence of a carbonate, or any other alkaline body in yellow lead chromium, is also to be considered in the case of compounding these yellow pigments with Prussian blue to form Brunswick and other green paints; such alkalies chemically react and destroy the colour of Prussian blue, causing the pigment to lose its blue colour and become more or less brown or otherwise changed.

In the case of vermilion the usual adulterant is red-lead or orange mineral; these bodies are used because they are heavy ones like vermilion itself. Their presence of course lessens the vivid red colour of the vermilion: but to restore it, the pigment is brightened up by the presence of eosine or some kindred red aniline dye colour. As red-lead and orange mineral are both good pigments, there is nothing to be said against their use on that point; but, of course, when a man buys an article, and pays the price of the genuine article, he does not want to be palmed off with something inferior, and, therefore, vermilion, adulterated with either of the above bodies is an undoubted fraud.

Ultramarine Blues are now produced so cheaply that it does not pay to adulterate the cheaper grades, nevertheless, even the low grade ultramarine are not free from reproach because they frequently contain much free sulphur, owing to the careless or insufficient attention bestowed on making these blues. Now, the presence of sulphur in a paint is one of the most disastrous bodies possible to be there, as it causes all manner of chemical changes in many pigments, whereby they change in colour or lose their stability. The same remark about the presence of sulphur holds good in the case of all those pigments which owe their colour to the presence of sulphur as a component; such colours are vermillion, cadmium yellow, orpiment or "King's" yellow, and a few minor pigments.

Chrome-greens that are generally sold are mixtures of yellow chromates of lead and Prussian blues; but the true chrome-greens are oxides of chromium. Opaque oxide is of a sage-green colour, of very good body and unctuosity when ground in oil. The transparent oxide of chromium is a very brilliant, full, rich green, of good body and working qualities; but the method of producing this splendid rich green is too expensive to permit of the pigment being used in common house-painting, while the dull, greyish-green colour of the opaque oxide renders that an undesirable pigment for many purposes of the decorative painter.

In the case of Venetian, light, and other reds, which are oxides of iron, they are seldom pure oxides, but a mixture of sulphate of calcium and red oxide of iron. In this case the presence of the sulphate cannot be looked upon as an adulterant, because it is used in calcining the ingredients which are employed in producing the red oxide, so as to render the production of the red colour easier; this it does, as it enables the salt of iron that is employed to be reduced to the red oxide at a lower temperature than would be the case if the iron salt were calcined alone. The only things to guard against in the red oxide of iron are to make sure that all the sulphate of calcium has become broken down or pulverised, because, if it be in a lump, it will be a drab or buff colour, and this not only materially spoils the colour of the red pigment, but also reacts on the oil vehicle, and causes the paint to work lumpy and go livery. There is one advantage in the presence of the sulphate in red oxide of iron: and that is, it enables the red oxide to be

ground up with an oil vehicle, for if the red oxide were the pure oxide, the union that would take place between the oxide and oil would be so energetic that the paint would be burned or rendered useless. The presence of this sulphate lessens this activity of the oxide on the oil, and therefore its presence is beneficial.

We must leave for a future paper the further consideration of this subject. H. C. S.

AN ARCHITECTURAL CURIOSITY.

THE following form is being issued for signature by architects desirous of being appointed to erect the Hastings Workhouse, the cost of which is to be about £50,000, and for which an entirely new set of drawings must be made, as the site is a different one:

To the Board of Guardians of the Hastings Union.

Ladies and Gentlemen,—I beg to apply to the Guardians to be appointed to act as Architect in connection with the erection of Workhouse Buildings for the Hastings Union, and to state that if appointed I agree to abide by the following conditions:—

1. To adapt the Guardians' plan to provide administrative buildings for 500 inmates, and accommodation for about 370 inmates on the nine acres field, Cackle-street, Ore.

2. To adapt the plans above mentioned, and to prepare such other plans, drawings, specifications, and rough estimates of cost as may be necessary, and will meet with the approval of the Guardians and the Local Government Board.

3. To make all necessary reports to the Building Committee, the Guardians, and the Local Government Board, and to give personal attendance before such Committee, Guardians and Board when so required to do.

4. When the scheme has been adopted by the Guardians, and approved by the Local Government Board, to prepare quantities and estimate of cost, in order that tenders for the execution of the work may be invited, and upon a tender being accepted, to prepare and submit a draft contract for the approval of the Guardians, and to supervise the carrying out of the whole work to its completion

5. The Guardians to appoint and pay for the services of a clerk of works.

6. My remuneration to be £600, for all services from the time of engagement to the completion of the work and for any extra work that may be necessary. The work of the preparation of the quantities to be an additional charge equal to 1½ per cent. on the contract price, which additional charge is to include the cost of lithographing, &c.

7. In the event of the work not being carried out after the preparation of plans if the reason be not my own fault the sum of £100 to be paid to me in full settlement of my claim against the Guardians.

8. The Guardians to have power to determine the appointment at any time before the commencement of the work upon payment to me of the said sum of £100.

9. All new plans, drawings, specifications, and other documents to become the absolute property of the Guardians.—I beg to remain,

Ladies and Gentlemen,
Your obedient Servant,

The remuneration offered contrasts somewhat remarkably with that paid to the Board's former architect, we believe!

A new graded board school is to be built in Rosendale-road, West Dulwich, at a cost for the building of £15,589.

A special meeting in committee of the Bath Town Council was held last week to consider a letter from Mr. A. R. Holland, proposing to erect on the old slaughter-house site a hotel of the value of £25,000, provided the corporation made a new roadway from Pierrepont-street to Bridge-street, and demolished certain houses belonging to the city so as to open up the site. The meeting was favourable to the scheme, and a committee of nine members was appointed to conduct negotiations with Mr. Holland, and to report to the council.

Colonel Hasted has given his award in the arbitration respecting the cost of maintenance and repairs of main roads within the Flint borough. The amount in dispute between the county council of Flintshire and Flint Town Council was for the three years ending March 1896. The town council claimed the sum of £989 16s. 10d., the county council offered £819 4s. 8d., and the arbitrator has awarded the sum of £938 4s. 10d, the arbitrator's cost (£20 3s. 8d.) to be borne in equal proportions by each authority, and each party to pay their own costs.

Through the enterprise of the Handsworth Urban District Council, the area of the Victoria Park has just been trebled in size by the addition to the original park of some 44 acres. The Victoria Park was established in commemoration of the 50th anniversary of the Queen's Accession, and the extension was intended to celebrate her Majesty's Diamond Jubilee. The cost of the extension has been £17,000. The plans for the laying out of the ground and the designs for the new bridge and boathouse were prepared by Mr. E. Kenworthy, surveyor to the urban district council, and the gardening operations have been carried out under the superintendence of Mr. Mair, the park-keeper.

OBITUARY.

The death is announced, at the age of 67 years, of Mr. William Davies, builder and contractor, of Gumfreston House, Culver Park, Tenby. Amongst the buildings which he erected may be mentioned Tenby and County Club, board schools at Whitland and St. Clear's, Tenby Wesleyan Chapel, St. Julian's Chapel, Tenby; St. Andrew's School and other houses on the North Cliff, the rectories of Tenby, Jeffreston, and Gumfreston, Tenby Parochial Schools, Somerset Houses, Esplanade; Tenby lifeboat house, the greater number of the houses in Victoria-street, Lancaster Buildings, Tenby Market. He also constructed for the Admiralty Department the coastguard station at Angle, and the silent battery at Tenby. During the latter years of his life he carried out a deal of work for the War Department, including the several large stores at Pembroke Dock, and a two-gun battery at Ferryside. He also held the repairing contract for the War Department from Ferryside to Pembroke Dock, at which latter place he built the new co-operative stores. The deceased, who was twice married, leaves a family of eight—four sons and four daughters. For twelve years he was a member of the Tenby Town Council.

CHIPS.

Memorial stones of a new free Methodist chapel were laid last week in Carlton-street, Horninglow, near Burton-on-Trent. The present section of the building will seat 200 persons, and the contract has been taken by Mr. A. Mason, of Barton.

The urban district council of Sevenoaks decided on Monday to raise the salary of their surveyor to £275 per annum.

A discovery of Roman remains has just been made at Dorchester. A few days ago, while digging the foundation for the church house in connection with All Saints, the workmen came upon part of a tesselated pavement and other indications of a Roman villa. A porringer in a good state of preservation was unearthed a few feet below the surface, together with a vase.

On Saturday, the committee of Perth Town Council met with Mr. Westland, of Messrs. Blyth and Westland, engineers, and opened the offers for the new bridge. As it was found they considerably exceeded the probable estimate, they were remitted to the engineers for examination and report.

The interesting old church of St. George's, Douglas, Isle of Man, is about to be taken down on account of the unsatisfactory condition of the building. Some little time ago upwards of £2,000 were spent upon its restoration, but it is now found necessary to rebuild the church.

The rector of Llanrwst has started a movement for the erection of a church house in Conway-terrace, Llanrwst, at an outlay of about £1,000, as a memorial to his predecessor in the living, the late Archdeacon Hugh Jones. The architect is Mr. M'Intyre, whose plans show a building to accommodate 400 persons, with classrooms adjoining.

Miss Chattock laid at Solihill, on Saturday afternoon, the foundation-stone of the Victoria Home for Nurses, which is in the course of erection in Beechnut-lane. Miss Chattock is defraying the entire cost of the building, the plans for which have been gratuitously prepared by Mr. J. A. Grew, architect.

The Plynlimon and Hafan Railway, which runs from Llanfihangel on the Cambrian Railway to the stone quarries of Plynlimon, was on Monday formally opened for passenger traffic. The line has been primarily constructed with the object of developing the stone industry of Mid-Wales.

Mr. W. A. Ducat, an inspector of the Local Government Board, held an inquiry at the town-hall, Newport, Mon., on Friday, into the application by the town council for power to put into force the Land Clauses Acts, in order to acquire lands required for the construction of a new road from Corporation-road to Liswerry. It is estimated that the road will cost £3,950, and towards this certain landowners have agreed to contribute £1,685.

Mr. Harry Hems, the widely-known ecclesiastical sculptor of Exeter, is, says the *Times of Natal* of March 10, in Pietermaritzburg, having arrived by the *Avondale Castle*. He will remain there for a few weeks, and then go on to Johannesburg, Pretoria, Kimberley, and Mafeking, returning again to the city some time in April, and leaving for England about the middle of May.

The Derker Schools, the largest property of the Oldham School Board, were opened on Saturday. The buildings replace a privately-managed school, and have been erected at a cost of £20,600. They provide accommodation for 1,524 children. Mr. T. Taylor, of Oldham, is the architect.

COMPETITIONS.

Aberdeen.—The competition for the erection of a new Free Church at the corner of Mid-Stocket-road and Beechgrove-avenue, Mile-End, Aberdeen, has just been decided. The design of Messrs. Brown and Watt, of Aberdeen, has been selected, and that by Mr. A. Marshall Mackenzie, A.R.S.A., also of Aberdeen, has been placed second by the assessor. The selected design is proposed to be built of light Kemnay granite, and the style of architecture is a phase of Early English, with Scotch features. A lofty tower with broach spire will rise at the north-west corner, and, attaining to a height of 175ft., will be a conspicuous landmark from many parts of the city and the surrounding country. For a height of 100ft. from the ground it rises as a square tower, having double-light windows with pilasters running up at the angles, while, at the summit above-mentioned, run out four pointed turrets. From this point the tower tapers off in a slender granite steeple, surmounted with a finial. The church is seated for 800 worshippers, and the total cost is set down at £8,000. In the second design, submitted by Mr. A. Marshall Mackenzie, the church would consist of a nave and two side aisles. The choir would be accommodated in a special gallery at the east end, with special provision for the introduction of an organ. The design provided for the accommodation in the church of 820 worshippers, and the seating accommodation in the hall was put down at 361. Provision was made for session-house, vestry, &c. The walls were to be of Kemnay granite, rock-faced ashlar, with picked dressings, and the internal arches and pillars of Corennie granite. The tower was battlemented, and finished by a dwarf spire rising within the parapets of Scottish type. The architect estimated that the probable cost of the whole buildings, including the inclosing walls and railings, decoration, &c., would be £8,000. It is understood that the assessor held the view, in which the committee concurred, that the design could not be carried out for the amount stipulated. The fine proportions of the tower of the church were generally admired, as constituting a commendable departure from the spiral architecture so common in ecclesiastical buildings in Aberdeen. The design is not unlike in general effect to the towers of the cathedral in Old Aberdeen.

Birmingham: Holly Moor Lunatic Asylum.—In October last the city council of Birmingham received a report from the Lunatic Asylums Committee announcing the completion of the purchase of Holly Moor Farm as a site for a new asylum, and recommending that Messrs. Martin and Chamberlain, the architects of the Rubery Hill and Winson Green Asylums, Warwickshire, and also of those at Bridgend and Carmarthen, be appointed as architects. By 32 votes to 30 the council rejected the committee's report, although it transpired that the nominated architects had prepared sketch plans, and decided to have a limited competition, Messrs. Martin and Chamberlain being one of the six local firms invited to submit plans, and Mr. G. T. Hine, F.R.I.B.A., of Westminster, being nominated assessor. At a meeting of the Lunatic Asylums Committee, on Friday, a report was received from Mr. Hine, in which he gave the preference to plans distinguished by the name "Forward," and the committee unanimously adopted his recommendation. Upon opening the sealed envelopes containing the clues to the authorship of the various plans, it was found that those selected were sent in by Messrs. Martin and Chamberlain.

The urban district council of Cannock have decided that Mr. H. M. Whitehead, their surveyor, be appointed as sanitary inspector at a salary of £135 per year, which, with his salary as surveyor at £165, will make a total of £300 per year.

Considerable interest will be evinced in the trials of motor vehicles for heavy traffic which have been arranged by the Liverpool and District Centre of the Self-Propelled Traffic Association, to take place in Liverpool next month. The object is to arrive at a type of heavy motor-waggon suitable for trade requirements in Liverpool and neighbourhood which shall be capable of economically taking the place of horse haulage. The trials will be over minimum distances of 30 miles on four successive days, but no longer route than 40 miles will be selected. Money prizes of £100, £75, and £50, together with certificates of merit, are to be awarded. Mr. Shrapnell Smith is the local secretary.

Engineering Notes.

Alexandra Palace.—An electric tramway from the gates of the park in which the Alexandra Palace stands to the entrance to the building is being constructed, at a cost of between £9,000 and £10,000. The length is about one third of a mile, and the gradient of the hill is very steep. The work of constructing the tramway—which will be the first to be worked by electricity in London—is being carried out by the Imperial Electric Light and Power Company, in conjunction with Messrs. Wandruszka and Co., of Berlin. The tramway will be worked on the overhead trolley system. Each car will have its own trolley, and will be fitted with a couple of American motors of the Steel type, giving in combination from 50 to 60 horse-power. The cars will be of American make and style, and each will be about 40ft. long, and will accommodate 60 passengers. Messrs. Taylor and Field, of Westminster, the electrical engineers who have the supervision of the work, are directing also arrangements for lighting the main hall of the palace by electricity.

Dock Extension in Liverpool.—The Mersey Docks and Harbour Board Bill, which embraces a scheme of dock extension involving an outlay of £3,562,000, has been passed as an unopposed measure, by a Committee of the House of Lords. The scheme contemplates the construction, on the southern portion of the dock board's estate at Liverpool, of four new branch docks and two new graving docks, with a new deep-water entrance to the existing Brunswick Docks, and, on the northern portion, two new branch docks and one graving dock, with improved entrances. Ten years are given for the completion of the works; but it is the intention of the board to carry them out at the earliest possible moment. When the Bill reaches the House of Commons it will be opposed by the representatives for Ireland on behalf of the Irish cattle-trade, who desire that the dock board should construct, without delay, the new Waterloo Dock landing-stage, at a cost of about £30,000.

Great Northern Railway Extensions.—An omnibus Bill of the Great Northern Railway Company came before a Select Committee of the House of Commons last week. Under the Bill extensive powers were sought for widening the existing main line at various points between London and Doncaster, and the construction of a loop line about 20 miles in length between Wood Green and Stevenage by an extension of the Wood Green to Enfield branch by way of Hertford to a point in the main line between Knebworth and Stevenage. This new loop line, which will involve an estimated expenditure of some £1,090,500, will have the effect of placing Enfield and Hertford on a through route between London and the North, and of opening up a district at present poorly served by railways. Another important work, estimated to cost half a million, is the widening of the line at Finsbury Park. For this purpose it was necessary to take a slice of Finsbury Park itself, and here the company met with the unsuccessful opposition of the London County Council. The committee passed the preamble of the Bill, which has been reported for third reading. For the purposes of the works proposed in the Bill, it is intended to raise further capital to the extent of two millions and a half sterling.

Leen Valley Railway.—The extension of the Great Northern Railway Company's line in the Leen Valley, Nottinghamshire, from Annesley to Sutton-in-Ashfield, Skegby, and Teversall, was officially opened for passenger traffic on Monday. The line passes through a rich mineral country, and sidings have been made at Pleasley, Silverhill Summit, and Birchwood Colleries. The length of the line now open for traffic, including the colliery sidings, is twelve miles. The contract was let to Mr. Walter Binns, of Bradford, who carried out the greater portion of the work; but the line was completed by Mr. W. H. Hutchinson, of Mansfield. The line will be continued as far as Langwith, a further distance of four-and-a-quarter miles, and the contract for this section has been let to Mr. Hutchinson.

At the last meeting of the urban district council of Buckley, Flintshire, Mr. Edward Astbury, joiner and builder, Buckley, was appointed to the offices of inspector, surveyor, and rate collector at a combined salary of £100 per annum.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Cement. (Inquire of B. T. Batsford, 94, High Holborn, W.C.)

"BUILDING NEWS" DESIGNING CLUB.

SEVENTH LIST OF SUBJECTS.

G.—A suite of oak furniture and chimneypiece, suitable for the living-room of the Gentleman's Bungalow which formed the subject for the sixth and last competition of our Designing Club. The room is 24ft. long by about 18ft. wide. The chimneypiece is to have a fire 18in. wide. The whole composition is to be 4ft. 6in. wide, and the total height is to be not more than 7ft. 6in. including the overmantel. A good shelf is to be provided, and tiles are to be are to be introduced round the slow-combustion firegrate. The table is to be suitable for a dining-room. One armchair with leather seat, and a sideboard. This latter is to be 6ft. long, and have cupboards and drawers below, with buffet shelves above. The entire height is not to exceed 5ft. Style left to the competitors. Scale for general drawings, inch scale, and details quarter full size. Plans sufficient to show the design, and armchair may be shown only by a view. A view of the buffet is desirable.

Drawings Received.—"Swan," "Don't Know," "Gib."

Correspondence.

FYLDE UNION WORKHOUSE COMPETITION.

To the Editor of the Building News.

Sir,—We have the pleasure to inclose herewith copy of letter sent by us to the Clerk to the Guardians, and shall be obliged if you will be good enough to insert same in your next issue.—Yours faithfully, Crickmay and Sons.

13, Victoria-street, Westminster, S.W.,
April 5, 1898.

Fylde Union Workhouse Competition.

13, Victoria-street, Westminster, S.W.,
March 26, 1898.

Dear Sir,—We are very much astonished in finding from the local papers that Messrs. Haywood and Harrison, of Accrington, have been appointed architects for the carrying out of this work, after your intimation to us of the 11th inst. that the first prize had been awarded to our plans, and this from the public reports appears to be on the ground that Messrs. Haywood and Harrison are local men and we are London men, and not on the ground of the superiority of the plans.

In reference to your conditions of competition, in clause 7 you state:—"The Committee will be advised in their selection by a professional assessor, who will be a Fellow of the Royal Institute of British Architects."

And clause 9 states:—"To the authors of the three designs which, in the opinion of the Committee and the Assessor, are most worthy of it, three premiums of £150, £100, and £50, respectively, will be awarded in accordance with their order of merit. The premium of the architect selected to carry out the work will merge into his usual commission of five per cent. on the outlay of the whole, or any portion the Guardians may decide to carry out."

Relying upon these conditions, we decided to compete for the position of architects, and not for the premiums.

We went to Kirkham, made every inquiry, prepared our designs, and sent them in due course.

We saw by the local papers that an assessor had been appointed, and that he had advised the Guardians to select ours as the most suitable design, and on the 11th March you wrote us follows:—

Plans for new workhouse.

"I beg to inform you that the first prize has been awarded to your plans in this competition."

This letter was accompanied by a list of competitors, at the bottom of which it stated:—

"First prize awarded to No. 3. Second prize to No. 13. Third prize to No. 16. The plans will remain staged at the Workhouse, Kirkham, until Saturday, the 19th inst."

We went to Kirkham and examined the plans very carefully and critically, and divesting ourselves as much as possible of prejudice, we came to the conclusion that there was no other set of designs which had entirely solved the problem so completely as we had done.

When at Kirkham, we sent in our names to the chairman and yourself, and found it was not convenient for either of you to see us, and on our return to London we forwarded you references which should have been sufficient to prove our competency and ability to carry out the work.

You may, therefore, imagine how surprised we are to find reported in the local papers of yesterday a statement that the committee, after careful consideration, had decided that Messrs. Haywood and Harrison should be intrusted with the work, and from the report of the subsequent remarks, it appears that the guardians thought they had taken a proper step in appointing a local man.

In our opinion, it would have been perfectly right on the part of the guardians if they had decided in the first place that only local men should compete; but having thrown the competition open and revised their conditions, in our opinion, they are bound by them. And so far as the chairman's statement that Messrs. Haywood and Harrison's plans seem to be the best, we are so satisfied of what would be the decision of the Local Government Board, that we challenge the guardians to send up the three sets of competition drawings to the Local Government Board, and let them, with their full knowledge of the requirements decide as to which set of designs most nearly complies with their stipulations, and who should be appointed as architect, and by their decision we pledge ourselves to be bound; but failing this, we hereby give you and the Guardians notice that we regret to have to say that we feel compelled to consult our solicitors, and to take such steps as they may advise us in order to enforce our rights in this matter.

If driven to it, this will be the first time in the course of a very long practice that we have been compelled to take legal proceeding of any kind; but in this matter we feel so deeply wronged that we shall be bound to vindicate ourselves.

A copy of this letter has been sent to the Local Government Board, the *Builder* and Building News, and the local papers.—We are, dear Sir,

Yours faithfully,
(Signed) Crickmay and Sons.

The Clerk to the Guardians of Fylde Union.

The Government have just purchased Old Park, Canterbury, for military purposes, and extensive barrack accommodation will be provided on the site.

The memorial stone of new buildings in connection with the Church day-schools of St. John Baptist, Dorset-road, Tuebrook, was laid, on Saturday, by Canon Lester, chairman of the Liverpool School Board. The work is in progress, and being carried out from the plans and under the superintendence of Messrs. Woodfall and Eccles, architects, Castle-street. Mr. W. Knight, of Tuebrook, is the contractor. The cost will be £1,700.

The Public Buildings (Expenses) Bill passed through all stages in the House of Lords without opposition, and on Friday received the Royal Assent. The London Building Act, 1894, Amendment Bill was also read a second time in the House of Commons on Friday night.

On Wednesday week, Col. Slack, the inspector appointed by the Local Government Board, held an inquiry at the Bull Inn, Horn's Cross, as to the application of the Dartford Rural District Council to borrow £1,000 for the buildings at Stone Cemetery. Mr. G. H. Tait, architect, explained the plans.

An important step has been taken, 23 years after the passing of the St. Albans Bishopric Act, towards providing an episcopal residence in the cathedral city of the diocese. Fourteen years ago Lord Grimthorpe purchased a plot of ground close to the cathedral, and he has now transferred it to the Ecclesiastical Commissioners at the price he gave for it. An effort will be made to raise funds to erect a palace without further delay.

Intercommunication.

QUESTIONS.

[11929.]—**Useful Items for Builders, Plasterers, &c.**—Will the writer of the above article, in the Building News for March 11th last, kindly favour me with a reply to the following query? He would greatly oblige me. Can wax of any sort be dissolved in liquid without of necessity applying heat? I wish to apply it with a brush, in a cold state if possible.—N.

[11930.]—**Brick Ornament.**—A carved piece of brickwork, about 5ft. long by 2ft. high, has to be done. Is it not better to get the work put together and carved in the shed, and then fixed in position? Will some experienced bricklayer reply?—C. L.

[11931.]—**Plumbing Fittings, &c.**—Are there any books which will give the arrangements for fitting up large houses and hotels, and the kind of work, size and thickness of pipes, brass fittings, and other details required?—Learner.

[11932.]—**Photography for Architects.**—Is there any guide that will help me in learning the art sufficiently to be able to take views of buildings that I come upon in my cycling or rambles?—T. F. M.

REPLIES.

[11924.]—**Terracotta Work.**—It is well to joint this material as you would stone. You can have the blocks of any reasonable size, but large blocks are more liable to twist in burning. This journal cannot well select firms to recommend. Terracotta should be set in mortar with a fine joint.—Henry Lovegrove.

[11925.]—**Gauged Work.**—There is, I think, a small book in Weale's series on this subject; but "W. H. H." could get all he requires from some practical bricklayer if he is observant, and has seen building work executed.—H. L.

[11925.]—**Gauged Work.**—There is no treatise specially devoted to this sort of brickwork; but the elementary treatises published by Lockwood and others give particulars and directions for cutting and rubbing and setting. Bricks for this purpose should be rather soft, of even texture, free from holes, &c., so that the cut and rubbed surface may be smooth, and the arrises sharp. The Fareham red rubbers or the Bracknell bricks are probably the best, though there are excellent rubbers made by R. M. and H. Whiting, Faversham. The bricks used for gauged work should be of full size, rather thicker than ordinary bricks, so as to allow for rubbing the beds and joints; the mortar used is lime putty, or a composition of whiting and patent knotting, a mixture of naphtha and shellac, the latter for work intended to be carved. One objection to gauged work is that it is a facing that is not often bonded to the wall, and it is not so durable as ordinary brick, though we know of many buildings in Surrey in which gauged work is used which has stood for more than a hundred years, and the surface is quite hard.—G. H. G.

[11926.]—**Size of Chimney Stack.**—A "Student" will find flues of 9in. square sufficient for his purpose. The brickwork will be gathered together in the usual way of corbelling, or if two breasts carry one stack, these should bear arch between them.—H. L.

[11927.]—**Extra Commission.**—If it becomes necessary for any or all of the work under the contract to be measured, the person measuring is clearly entitled to be paid for his services by the employer. In this case, the surveyor who had prepared the quantities would check the builder's measurements, and prepare a bill of extras, which the architect would examine, and upon it make out his certificate. For this latter service architects rarely charge; but they get the usual commission on the total amount of work executed. If the result shows that the errors were serious, the builder may reasonably expect that his surveyor should be paid by the employer; and although he could not, I think, recover his costs, I have known some allowance made to him. The architect would not, I think, be able to charge for any work done in making up the amount due on each certificate.—Henry Lovegrove.

CHIPS.

Mr. Alexander McDowall, J.P., timber merchant, of 48, West George-street, Glasgow, died on March 29th, at 5, Glencairn-crescent, Edinburgh.

The Lords Commissioners of Her Majesty's Treasury have selected Mr. Hawes Harrison Turner for the post of Keeper of the National Gallery and Secretary and Accounting Officer to the Trustees.

The Supreme Court of Pennsylvania has sustained the action of the County Court, in refusing to issue an injunction restraining the Capitol Commissioners from awarding contracts for the new Capitol Building at Harrisburg, so that nothing now seems to stand in the way of the prosecution of the scheme.

A memorial to Dr. Arnold has been placed on the north wall of Lalehum Church. The memorial is in carved brass, the letters being in relief. The inscription was written by the late Dean Lake, formerly Dean of Durham, who was then the senior surviving pupil of Dr. Arnold. Dr. Arnold lived at Laleham, in a house occupying the position of the present vicarage, from 1819 to 1828.

The Lambourn Valley Railway was formally opened on Monday after inspection on Friday by Col. Yorke, R.E., on behalf of the Board of Trade. The line is 12 miles in length, and extends from a junction with the Great Western system at Newbury through an agricultural district to the town of Lambourn and its racing stables.

LEGAL INTELLIGENCE.

Defective Soil-Pipes.—J. O. Richardson, builder, Albert Works, Peckham, appeared before Mr. Hopkins at the Lambeth Police-court on Thursday in last week to answer to a summons taken out by the Camberwell Vestry for badly executing some vertical soil-pipe drains at the South London Art Gallery in the Passmore Edwards' Technical Institute, Peckham-road. The proceedings were taken out under Section 42 of the Public Health (London) Act. Mr. G. W. Marsden, solicitor to the vestry, prosecuted, and Mr. Geo. Elliott appeared for the defendant, Mr. J. O. Richardson. Inspector Stevenson gave evidence in support of the charge as to bad workmanship, and proved the existence of escapes from the joints of the iron vertical soil-drains which had not been properly caulked with lead. This was confirmed by the Medical Officer of Health, and by Mr. King, a certificated plumber, who has since redone the work for the vestry. Mr. Elliott admitted there was no defence, but the defendant excused himself with the plea that he had only too faithfully followed the specification. Mr. King in his evidence said he had received no other instructions than those contained in the same specification, and that his work had withstood the water-test to the satisfaction of the sanitary authority and also of the architect. No other witnesses were called, and the magistrate fined Mr. J. O. Richardson 40s. and three guineas costs.

Extras and Penalties.—The action of Jenkins and Sons v. Randall was tried by Mr. Justice Channell, sitting without a jury, on two days of last week at the Glamorganshire Assizes. Messrs. J. Jenkins and Co., builders, Bridgend, sued Mr. W. R. Randall, solicitor, also of Bridgend, for £771, for balance and extras due on a building contract. In October, 1894, the plaintiffs contracted to build a residence near Bridgend for defendant from designs by Mr. F. J. Thomas, architect, for £1,700. This was called the original contract. Very soon after alterations were commenced, continual changes and additions going on. In April, 1895, the defendant wished to have a large new wing added. This the plaintiffs refused to tender for under the old contract, as they were dissatisfied with the architect; but it was eventually agreed by them to go on, subject to arbitration as to the new wing. Alderman David Jones, of Cardiff, was agreed upon as arbitrator. In the new contract made the defendant would only allow the arbitrator to deal with prices and values, defendant holding that his architect's quantities should rule, so that the award was given in schedule of prices without a sum total being arrived at. When the award was received, the plaintiffs appealed to defendant and his architect for the quantities; but up to the present they had refused to put them in, thus making the award valueless. Plaintiffs made out their own quantities and applied them to the arbitrator's prices, and this showed a balance due to them above what was paid on account of the new wing of £368. Added to this were extras on the original contract of £391. The architect had certified that only £250 was due, and the defendant further deducted from this amount £175 as penalties for non-completion of the building within the time prescribed, paying the residue of £75 into court. The Judge pointed out that as the architect's certificate had not been set aside within the prescribed period the plaintiffs could not now go beyond it, and they were compelled to abandon £140 on this part of the claim. The remainder of the claim was made up of £368 13s. in respect of a wing added to the house under a supplemental contract dated June, 1895. In this case the architect certified for only £168 17s. 3d. The plaintiffs were now suing on the full amount due on both contracts, amounting to £762, while the defendant had paid £75 into court. At the close of the first day's hearing, Mr. Justice Channell ordered the defendant to put in the quantities, and also requested the architect to apply them to his prices. On the second day Alderman Jones attended, and made the amount £237 19s. 7d., as against £168 18s. 3d. admitted by defendant. Plaintiffs abandoned £140, because there was no architect's certificate as regarded this. Defendant claimed £175 for damages for non-completion. In the course of the argument, the Judge said this expensive action had been rather thrown away, as if the figures had been gone through earlier it would not have been necessary at all. In the end, judgment was given for plaintiffs for £412 19s. 7d. and costs, beyond a sum of £75 paid into court. His Lordship ruled that the ordering of extras under a building contract did away with penalties, and disallowed defendant's claim on this head.

Claim from Paddington against the School Board for London.—Mr. Under-Sheriff Burchell and a special jury, at Red Lion-square, Holborn, heard on Friday the case of "Pearce v. the School Board for London," a claim for about £6,500 compensation for land taken and houses injuriously affected adjoining Paddington Recreation Ground. It appeared that the School Board acquired a portion of a plot of land which the claimant held on lease from the trustees of the Bishop of London. The claim was put forward under three heads—the profit rent on the land taken; builder's profit on the houses which would have been erected; and consequential damage to claimant's houses opposite the proposed school. Sir Edward Clarke objected to the claim for compensation for injuriously affecting the houses opposite. The School Board, he said, were not like a railway company working at a profit. If the jury were allowed, after his objection, to assess the damage to the opposite houses, then the Board desired to test the question, and he therefore asked that the verdict should state the sum awarded under each head of claim. The expert witnesses for the claimant were Mr. Wetherall (Messrs. Wetherall and Green) and Sir John Whittaker Ellis (Messrs. Farebrother, Ellis, and Co.); while the experts for the School Board were Mr. Daniel Watney (past president of the Surveyors' Institution), Mr. G. A. Wilkinson (Messrs. Wilkinson and Sons, Mr. Pilditch (Messrs. Pilditch, Chadwick, and Co.), Mr. Leopold Farmer, and Mr. Cooke (surveyor to the School Board). The jury awarded, for land taken £1,650, plus 10 per cent. for compulsory sale £165, together £1,815; for loss of contemplated profit on building, £875; and for injuriously affecting opposite houses, £1,000; a total compensation of £3,690.

Serious Charge against a Stonemason.—At Southwark Police-court, on Friday, John Service, a master stonemason, of Mina-road, Old Kent-road, and Belmont-road, Lee, was charged on remand with obtaining, by means of forged bills, £23 and £95 from Mr. William Jackman, horse-dealer, of Running Horse-yard, Blackfriars. The prosecuting solicitor said there were a number of cases against prisoner, involving a total sum of nearly £1,000. From a document which Detective-sergeant Cox, L division, found in the prisoner's possession, it appeared that the accused made copies of trade bills which he received in the course of business, and got the forged bills discounted by Mr. Jackman. Mr. William George Hornsey, contractor, of West Ham, stated that he gave a contract to Messrs. Bennett and Co. to carry out the mason work in the erection of some new buildings in Dover-street and Rider-street, Piccadilly, and during the progress of the work he gave them a number of trade bills. What purported to be his signature on the bills discounted by Mr. Jackman was a forgery. Mr. John Bennett, master mason, of 32, Gilbert-street, Russell-square, principal partner in the firm of John Bennett and Co., said he received bills of acceptance from the last witness, and handed them over to the prisoner, who had a sub-contract with him. The prisoner was entitled to several thousand pounds under this contract, and he had been over-paid. What purported to be witness's signature on the forged bills was apparently in the prisoner's handwriting. The prisoner was formally remanded, prior to being committed for trial at the Old Bailey, bail being refused.

Squabble between Architect and Builder.—At the West Riding Assizes, Stephen Elgar Thorrold, an architect and surveyor, of North Ormesby, near Middlesbrough, brought an action against William George Harrison, a builder, of North Ormesby, for damages for slander. The parties were members of the Ormesby District Council, and plaintiff's case was that on two occasions the defendant called him a forger. In the pleadings, defendant denied the slander, and alternatively said if he used the words they were true. The evidence for the plaintiff was to the effect that defendant had accused him of tampering with plans which came before the district council. In cross-examination, plaintiff was asked about the contents of a bill which he wrote in support of his candidature for a seat on the council, for which he was formerly surveyor—a position from which he admitted he was asked to retire. He admitted he spoke of those he was opposing as "barmy on the crumpet." In further cross-examination, plaintiff admitted that he called defendant a prevaricator, and that defendant offered to withdraw his words if he (plaintiff) would take back his. In summing up, his Lordship said the language used by both plaintiff and defendant was a disgrace. The jury found for the defendant.

Claim against a Quantity Surveyor.—At Churston County-court on March 22nd, Marcus Bridgman, contractor, Paignton, claimed £18 11s. of F. W. Vanstone, surveyor to the Paignton Urban District Council, for damages sustained by reason of defects in a bill of quantities supplied to plaintiff by defendant, &c. The claim was made up as follows:—Cost of supplying and laying 290ft. of pipes for the purpose of laying on gas to a lamp, £8 1s.; services by Mr. V. C. Brown, surveyor, £4; balance on £30 lent by plaintiff to defendant, £6 10s. Defendant had paid the £6 10s. into court with costs, and the £4 for Mr. Brown's services was withdrawn. In October, 1896, the district council required certain work to be done in Tower-road, Paignton, for which defendant prepared the plans and specifications. Tenders were invited, and plaintiff was among the contractors who tendered. Plaintiff instructed Vanstone, in his private capacity

as a surveyor, to draw up the quantities. It was for gross mistakes made by defendant in the preparation of the bill and for consequent damages that plaintiff made his claim. A portion of the work was connecting street lamps with the gas company's main, and defendant did not show the distances. The practice was, if no distances were shown in the bill of quantities, to assume that only a few feet had to be laid. As a matter of fact, plaintiff had to lay over 200ft. of gas-piping. Consequently the work cost him more than the £94, the amount of his tender, and he claimed for extras. The district council referred the matter to an arbitrator, who decided that the work was not an extra, as it was in the specification. Defendant's solicitor argued that it was the contractor's place to find out where the main was. His Honour: It was the quantity surveyor's duty to ask where the main was, and to measure it. There is no defence. I have had hundreds of cases of this kind, and know pretty well what is the duty of a quantity surveyor. He has to find out the quantities. I should be doing a very great disservice both to contractors and quantity surveyors if I allowed such a practice to creep into their work. A contractor would never be safe, and quantity surveyors would do their work in a slovenly manner. Mr. Vaustone went into the witness-box and said he had acted in accordance with his usual custom. The finding of the main was never mentioned to him, although plaintiff saw him every day. The Judge: But if the plaintiff had found the main and told you, what would you have done? Witness: I should have done nothing. The Judge: Oh, nonsense. Verdict for plaintiff for £8 1s., with costs.

Finality of Architect's Certificate.—Buckland v. Trood.—In this case, heard by Mr. Justice Darling in the Queen's Bench Division, sitting without a jury, last week, the plaintiff claimed as assignee of Messrs. Garner and Loveloek, a firm of builders. In 1896 Messrs. Garner and Lovelock entered into an agreement with the defendant to make some alterations on the defendant's premises. It was provided by the conditions attached to the specification that the works should be executed to the full satisfaction of the architect, and that payment should be made upon the certificate and at the discretion of the architect. On February 5, 1897, Messrs. Garner and Lovelock assigned to the plaintiff all moneys due or to become due to them under this agreement. The first point in dispute was as to various items of the work, amounting in all to £36 17s. 7d., which the defendant alleged to be negligently executed. As to the second point, the question was whether an item of £106 3s. 6d. for granite-work, executed by a Mr. Whitehead, was due from defendant to Whitehead or to plaintiff's assignors. Mr. Dickens, Q.C., contended, on the first point, that the architect's certificate was final. As to the second point, Whitehead was a sub-contractor under Garner and Lovelock, and had no direct contract with the defendant. Mr. Greene, Q.C., for defendant, argued that in all the reported cases where an architect's certificate had been held to be final, there had been words to that effect in the conditions, which was not the case here. As to the granite-work, it had been agreed by all parties that that portion of the agreement should be cancelled, and the work executed by Whitehead for defendant, and not for Garner and Lovelock. After hearing the evidence, Mr. Justice Darling said that, as to the first point, he could not admit evidence contradicting the architect's certificate. That certificate was final, and the defendant was not entitled to go behind it. On the second point, he had no doubt that the arrangement by which Whitehead took over the granite-work from Garner and Lovelock was entered into with Garner's consent, and on that point the defendant succeeded. Judgment for the plaintiff for £36 17s. 7d. and costs.

Manchester Corporation v. Perkins, Graham, and Co., Limited.—An action by the Manchester Corporation against contractors, to recover a considerable sum in respect of alleged defective work in the construction of sewers, came before Sir Benjamin Baker on Monday as arbitrator. Mr. Sutton, in opening the case, said Messrs. Perkins, Graham, and Co. contracted in 1893 to make three sewers in the neighbourhood of Water-street and Deansgate. They were to put in two rings of brickwork; but in many places they only put in one, and the work had been done in dry brick instead of in mortar. The result had been that the corporation had been put to great expense to make the sewers satisfactory. Messrs. Perkins, Graham, and Co. had paid £1,900 into Court to satisfy the claim, but the corporation contended that that sum was totally inadequate. The corporation paid £2,873 2s. 6d. for the part of the work they did themselves, and they further paid Mr. Nuttall, a contractor, £2,563 14s. 5d. for another portion of the work, and there had been left open a certain length of sewer for inspection, and £200 additional would have to be spent in putting that right. These were the sums the corporation were actually out of pocket, and in addition they said that the defendants had been largely overpaid. He supposed it might be said that the state of things which the corporation complained of was owing to the slackness of the supervision during the illness of the late city surveyor Mr. Allison; but that did not excuse the contractors. It was extraordinary that the corporation officials should have failed to the extent they did. It was estimated that Messrs. Perkins, Graham, and Co. put 300,000 fewer bricks into the sewer than they should have done under the contracts. A claim was made for £610 for cement packing; but when Mr. T. de Courcy Meade, the present city surveyor, proposed to have the sewer opened to see if the cement was there, Mr. Perkins said he would rather forego the claim than that should be done. However, Mr. Meade had the sewer opened, and he not only found that there was no cement, but that there was not the proper quantity of brickwork. Mr. Meade gave evidence in support of the claim, and the proceedings were then adjourned.

Lampeter Arbitration Case.—A long-pending arbitration case between John Watkin Davies, late of Llangybi Mill, and Mr. Wilmot Inglis Jones, of Derry Ormond, has at last been brought to a termination, the arbitrator (Mr. Arthur Lewis) having made his award. The action was brought by John Watkin Davies to recover £191 13s. 6d. for improvements and haulage of building materials towards the erection of new buildings at Llangybi Mill. The defendant had paid £30 6s. 3d. into court. The arbitrator finds that the amount payable to the plaintiff is £29 14s., and directs that judgment should be entered in favour of defendant, with costs, and that the plaintiff should also pay the costs of the arbitrator and award.

CHIPS.

The canopied work over the stalls in the chancel of the parish church of St. Lawrence, Ludlow, which has been placed there by Mrs. Phillips to the memory of the late rector of Ludlow, has now been completed, and the niches have been filled with figures. The work was begun by Sir Gilbert Scott, and his design has been carried on throughout.

The new infectious hospital at Worcester, which has been erected at a cost of upwards of £10,000, was opened on Saturday by the mayor of that city. It is constructed on the pavilion plan, the architects being Messrs. Rowe and Son, of Worcester.

The sanitary committee of the Manchester Corporation has presented a report to the council with regard to the proposed additions to Monsall Hospital. The committee recommend the erection of an isolation block and an erysipelas block, and of additional accommodation for nurses and servants. The cost of the new buildings is estimated at £27,500.

The Duchess of Montrose unveiled a statue of the Queen at Cheltenham College, Cheltenham, on Saturday. It is life-size, and represents her Majesty in full coronation robes, wearing the crown and holding the sceptre and globe. It is the work of Mr. Martyn, of Cheltenham.

Mr. William Henman, architect and surveyor, of Cannon-street, Birmingham, has been joined in partnership by Mr. Thomas Cooper, A.R.I.B.A., a pupil of and leading assistant to Mr. Alfred Waterhouse, R.A.

The water committee of Glasgow Corporation has recommended the acceptance of an estimate of £10,000 by Messrs Craik and Hendry for making a new driving road on the north side of Loch Katrine. The road, which will be four miles in length, will take the place of an old road at a lower level.

A meeting of Liverpool merchants and shipowners considered on Tuesday the proposed high level bridge over the Mersey, uniting Liverpool and Birkenhead. The intended bridge would be two miles long, having a roadway 62ft. wide, with one span of 2,000ft., and two others of 1,000ft. each. The headway above high water would be 120ft. The cost of the scheme would be nearly three millions. The engineers, Messrs. Webster and Wood, said that the scheme would pay 7 per cent., and would do for Liverpool what New York's Bridge had done for Brooklyn. The meeting pronounced in favour of some high-level bridge without committing themselves to this particular scheme.

The adjudication in bankruptcy is gazetted of Bernard Joseph Green, Wolverhampton, architect and surveyor.

Considerable alterations are being made to the Memorial Hall, Chesterfield, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

The members of the Institute of Clayworkers dined together at the Holborn Restaurant on Wednesday evening and the following morning. Some five-and-forty members embarked on the ss. *Fjord* for the annual excursion. Copenhagen is the destination, and excursions will be made to various brickyards in Denmark and Sweden. The return journey will be made from Esbjerg on Thursday morning next, the 14th inst.

PARLIAMENTARY NOTES.

The New Government Offices.—No Competition.—Mr. Akers-Douglas told Mr. W. Allen on Tuesday that it is not the intention of the Government to invite designs for the erection of the new Government offices at Whitehall. The Government has decided to take the responsibility of appointing the architects, and if the question is repeated at a later date, Mr. Akers-Douglas promises further information.—We think a competition would have been the right thing, though we are bound to confess that certain past experiences point the other way. Much will depend on the architect selected. It is said freely that the Government is taking counsel with the Council of the Institute; and in its probable ignorance of the fact that that body in no way represents the architectural profession, it is hardly to be blamed. If something like a job is the result, the Government will, however, have to bear the responsibility.

WATER SUPPLY AND SANITARY MATTERS.

Manchester.—The Local Government Board has written to the Manchester Corporation declining to sanction the proposal of the Rivers Committee to deal with the sewage effluent by the bacteriological method of treatment, as an alternative to the defeated culvert scheme by which it was intended to convey the effluent to the Mersey estuary. The Rivers Committee have consequently decided to recommend the city council to carry out the bacteriological system in spite of the Local Government Board, and borrow the money without the sanction of that body, as they can under the Public Health Act. The estimated cost of the plan proposed is £127,000. The Local Government Board's method of land filtration would, it is said, cost half a million.

The Shipley Urban District Council have decided to invite four architects to prepare designs for new offices, fire-brigade station, baths, stabling, &c., and that they be paid a fee of twenty guineas each, except the successful competitor, who will be paid by commission.

The foundation-stone of Raphael House, Moorfields, was laid on Tuesday by Mr. Raphael Tuck, the founder, some thirty years ago, of the art publishing house of Raphael Tuck and Sons. The new building has been designed in the Renaissance style by Mr. W. Hilton Nash, Mr. Delissa Joseph being consulting architect. The building has a frontage in Moorfields, and return frontages to White-street and Tenter-street.

The new viaducts at Trenance and Gover, on the Cornwall Railway, will be opened as a permanent way in July. They have solid granite piers, with turned arches and spandrils of Staffordshire brick, granite string course, and brick parapet, with granite coping. Messrs. R. T. Relf and Son are the contractors, who commenced building about three years since, under the personal superintendence of Mr. George Westlake, who is at present engaged at Sutton Harbour Works, Plymouth, and Mr. Charles Pickford (Great Western Railway superintendent). In the construction of the viaducts there have been two fatal accidents, both occurring at Trenance.

The directors of the North-Eastern Railway Company have let the contract for the extension of the Middlesbrough Dock to Mr. John Scott, of Cotherstone. Two new arms, 700ft. and 650ft. in length, will project westward, and the whole area will be widened, allowing large stretches of wharf area to be added. The entrance channel is also to be deepened along its course and widened on the south side. The plans are those of Sir J. Wolfe Barry. The original dock was opened in May, 1843, when it was only nine acres in extent; in 1849 it was leased to the Stockton and Darlington Railway Company, by whose successors, the North-Eastern Railway Company, it has been since twice enlarged.

A block of publishers' and booksellers' premises, five stories in height, has been built on the sites of Nos. 22 and 23, Warwick-lane, E.C., where for many years there stood an incommodious little cobbler's shop and other unsightly premises. The new shop, which has been built for Mr. Charles Taylor, is of Classic design, the front consisting of Portland stone and white brick. The new building, which has an area of 3,000sq.ft., has been erected from the designs of Mr. Walter Starr, architect, of 9, Queen Victoria-street, and the contract, amounting to £6,000, has been carried out by Messrs. Chessum, of the Crown Works, Haggerston.

The new Chelsea Baths at Kensal Town, which have been erected at a cost of £27,000 by Mr. C. Wall from the designs of Messrs. Harnor and Pinches, were opened last week. The building contains two swimming-baths, 80ft. by 30ft. and 60ft. by 25ft.; 51 private baths, of which 16 are for women; a laundry for the establishment, waiting-rooms and offices, and accommodation for the resident superintendent.

Our Office Table.

The London County Council considered, on Tuesday, a report of the Improvements Committee on the proposed improvements of Cripplegate, consequent on the great fire. The City authorities asked for a contribution from the Council towards the cost estimated at £629,000. The committee recommended that the City Corporation be informed that none of the suggested improvements would prove to be of such general advantage to the through traffic in London as to justify the Council in contributing any part to the cost. This was agreed to. It was *nem. con.* referred to the Highways Committee to consider and report as to the practicability of the Council laying and itself working a tramway along the top of the northern outfall sewer embankment from Stratford to Barking; and also what system of traction would be the most suitable and economical for such a tramway, and at what intervals the cars should be run in order to meet the requirements of the public travelling between Old Ford, Stratford, Barking-road, Beckton, Albert Docks, &c. Colonel Rotton, on the report of the Asylums Committee, asking the Council to approve the excess of £7,923 over the estimate in the final cost of the foundation of the Heath Asylum at Bexley, pointed out that the matter was a serious one, because it involved a dispute between two officials—the architect (Mr. Hine) and the works manager (Mr. Adams). The report was adopted without comment.

The Surveyors' Institution will pay a visit to Manchester on Wednesday and Thursday, the 20th and 21st inst. The use of the Mayor's Parlour in the town-hall has been granted by the Lord Mayor and Corporation. On the Wednesday members will assemble at 10.45 a.m. in this apartment, where they will be welcomed by the reception committee, headed by Mr. John Holden, the provisional chairman of the district, and after an address has been delivered by Mr. Christopher Oakley, the President of the Institution, the following papers will be read and discussed:—"Manchester from 1847 to 1897," by Mr. John Holden; "Lessons from Fire and Panic," by Mr. Thomas Blashill, superintending architect, L.C.C.; "A Consideration of Some of the Present-Day Difficulties met with in a Land Agent's Practice," by Mr. C. P. Hall; and "Notes on the Construction of Town Buildings," by Mr. Howard Chatfeild Clarke. In the evening the members will dine together at the Grand Hotel, Aytoun-street. The second (Thursday) will be devoted exclusively to excursions, separate parties being made up for (*a*) Chester and Eaton Hall, (*b*) the Manchester Ship Canal, (*c*) Crewe Railway Works, or (*d*) Egerton Cotton Mills and the Corporation Sewage Farm. The arrangements appear to have been thoroughly well organised by Mr. Julian C. Rogers, the secretary, and it is expected that the party at Manchester will exceed 200 in number.

A public inquiry, under the Fatal Accidents Act, was held on March 31 in the Sheriff Court, Edinburgh, into the circumstances attending the scaffold accident which took place on March 18 at the new North British Railway Hotel buildings, and by which three men lost their lives and several were injured. Evidence as to the stability of the staging which carried the cranes at a height of 60ft. above the North Bridge was given by George and Robert Cousin, of Alloa, the contractors, William Begg, their manager, and John Woodward, the clerk of works, and by many bricklayers and others. It was stated that no expense was spared in the construction, and that in the bracing bolts were used instead of nails. Mr. Thomas Heath, first assistant at the Edinburgh Royal Observatory, showed that at the time of the occurrence the velocity of the wind was 60 miles, and the pressure of 18lb. per square foot. Mr. Cooper, the borough engineer, was called, but counsel objected to his giving any opinion as to the cause of the accident, and Sheriff Rutherford informed the jury that the inquiry was not held for the purpose of ascertaining whether anybody was or was not to blame for that unfortunate event. What the jury had to find was as to the time and place of the accident, the time and place of the three deaths, and the causes of the deaths—not the cause of the accident itself. The jury having heard Mr. Cooper's evidence as to the accident, returned a purely formal verdict that the cause of death was injuries they sustained from being knocked down by the falling, during a gale of wind, of a large steam crane and boiler, with the scaffolding on which they were supported at a height of 63ft.

A deputation from the Liverpool City Council had a private interview on Monday with the Parliamentary Secretary of the Local Government Board, to seek the sanction by the board to the appointment by the corporation of a bacteriologist to assist in the administration of the Food and Drugs Act. Mr. Russell, in reply, reminded the deputation that the Food and Drugs Act only provided for chemical analysis, the science of bacteriology being much less advanced when that measure was passed in 1875. If the corporation cared to appoint an analyst who was also a bacteriologist, the Local Government Board could sanction his appointment in respect of chemical qualifications; but unfortunately the form of certificate required from the analyst was embodied in the Act of 1875, and it made no special provision for a search for disease germs by means of bacteriological examination.

CHIPS.

The new fever hospital erected at Thornhills, Clifton, by the Brighouse Joint Hospital Board was formally opened on March 30th. The architects were Messrs. Sharpe and Waller, of Brighouse.

The Eccleshill School Board have adopted plans by Messrs. Kendall and Bakes for enlarging their school at Greengates, at an estimated cost of £1,500. Additional accommodation for 90 children will be provided.

The Liverpool Corporation have accepted the tender of Mr. Charles Burt, of Wellington-road, for carrying out improvements at Newsham Park, at a cost of £7,187. The work consists of laying out as ornamental gardens a piece of land, sixteen acres in extent, which lies on the south side of Gardner's-drive and the west side of Orphan-drive. An avenue, ten yards wide, bordered on each side with trees and shrubs, will be formed, in which four fountains and a band-stand are to be erected.

The organ, renewed and enlarged, of St. Mary's Church, Penzance, has been for several weeks in the hands of Messrs. Heard and Sons, of Truro, and on Thursday evening in last week was again dedicated to Divine worship. The organ was built by Crabb, of Exeter, in 1835.

New Wesleyan Sunday-schools are in course of erection at Boston, Lincs. Mr. W. Greenfield, of that town, is the contractor, and the outlay will be about £2,000.

It has been decided to erect a new technical institute for Selly Oak, and a site has been secured at Bournbrook. The building will include necessary classrooms, reading-rooms, and a central hall for concerts, lectures, &c. Mr. B. B. Hirst, of Birmingham, is preparing the plans, and the cost is estimated at £3,000.

At the Keighley Workhouse Infirmary, a new block erected at the north-west angle of the grounds as a nurses' home was formally opened on March 30. The new building has been planned by Messrs. John Judson and Moore, architects, to accommodate nine nurses. The cost, inclusive of furnishing, will be about £1,000.

At Chelmsford, where rapid progress is being made in various industries, a new building estate is being laid out between Goldlay-road and Lady's-lane, Baddow-road.

The Southport Corporation have purchased by auction of the Scarisbrick Trustees for £18,050 a most central block of freehold property in Chapel-street and Market-passage, free from any restrictive covenants. The contents are about 520 superficial square yards. At present four small shops and a beerhouse occupy the site, and the corporation propose to widen a section of Market-passage—a thoroughfare connecting Chapel-street and Lord-street—and to abolish the beerhouse.

Messrs. F. V. Burridge, A. Evershed, and C. M. Pott have been elected Fellows of the Royal Society of Painter-Etchers and Engravers.

The Select Committee appointed by the House of Commons to consider the merits of the Bill promoted by the Metropolitan Railway Company with the object of obtaining power to use electric traction on their line, and in the meantime to make new ventilating openings at certain points, resumed its investigation on Thursday and Friday. The committee found the preamble of the Bill proved subject to certain conditions laid down as to clauses. The clauses were then adjusted, and the Bill was ordered to be reported. It is understood the Bill will be opposed in the other House.

The Birkenhead Guardians have appointed Mr. George Wharton, principal rating assistant to the Mersey Docks Board, as official valuer to the Assessment Committee, at a salary of £300 a year.

Trade News.

WAGES MOVEMENTS.

Birmingham.—Settlement of the Building Trade Dispute.—In October last the Birmingham Master Builders' Association received notices from the carpenters, plasterers, masons, plumbers, labourers, and scaffolders, demanding an increase of wages, to date from April 2. In the case of the first four named trades the increase asked was at the rate of 1d. per hour, whilst the labourers and scaffolders only demanded a ½d. advance. During the six months disturbing elements have been at work, with the result that the deliberations of the conciliation board up to a week ago were ineffective. At first the masters declared the increases to be unreasonable, but afterwards a promise was made of ½d. advance all round on April 1, 1899. This was rejected. Eventually the masters agreed to concede an advance of ½d. per hour, to come into operation on October 1 next. With the exception of the plasterers, the whole of the operatives agreed to accept this offer, and as the plasterers remained obdurate, the masters decided on Friday to grant the ½d. advance to the plasterers at once. The other advances will date from October 1. Several alterations in the rules will come into operation at once. The dispute is, therefore, at an end, and work is proceeding as usual.

Birmingham.—The brickmakers of Birmingham have given their employers 15 days' notice of a claim for 10 per cent. rise on moulding and ¾d. per hour rise in daywork, and certain other alterations desired in regard to the present conditions of labour in the trade.

Coalville.—At a meeting, on Saturday afternoon, at the Red House Hotel, between the master builders and the representatives of the Joiners and Carpenters' Association, an amicable arrangement was come to by advancing the rate of wages ½d. per hour. The rules were signed accordingly, and work was resumed on Monday morning as usual.

Glasgow.—One thousand cabinet-makers left work in Glasgow on Thursday in last week as a protest against the new regulations dealing with overtime and other questions.

Leicester.—The plasterers have obtained an advance of one penny per hour in their wages, a reduction in their hours of labour on Saturdays, and other concessions.—The whole of the carpenters and joiners in Leicester struck work on Saturday on a demand for an advance of ½d. per hour, between five and six hundred men being affected. The men originally demanded an increase from 8½d. to 9d. per hour and a reduction of hours, but were, on the suggestion of the local representative of the Board of Trade, offered by the masters ¼d. advance and two hours less per week. They decided, however, to drop the hours demanded and stand out for 9d. They offer to submit the question to arbitration.

South Shields.—A large number of the bricklayers employed at South Shields came out on strike on Friday for an advance of wages from 9d. to 10d. per hour. The usual three months' notice was given, since which time negotiations have been going on between the representatives of the men and the Master Builders' Association, but have proved futile. Besides the terms for an increase of wages there are also other conditions laid down in respect to the working rules. The masters offered ½d. per hour increase, but this the men have refused, on the ground that in all other parts of the district workmen were receiving 10d. per hour, and in some cases 10½d. and 11d. Other branches of the building trade are also in a disturbed condition. The stone-masons have demanded an increase from 9d. to 10d. per hour, and an 8-hours day or 44 hours per week, and the masters have offered 9½d. and 50 hours per week. The plasterers seek an advance from 9d. to 10d., and the masters have offered 9½d.: while the labourers request an advance from 6½d. to 7½d. per hour.

York.—At a large and representative meeting of the operative house-painters of York, held at the Victoria Hall on Wednesday in last week, it was unanimously decided to adhere to their former demand for 1d. per hour advance. It was stated that the wages of the York painters are now only ½d. per hour above those of the labourers in the city.

The plans for the proposed alterations to the Theatre Royal, Preston, prepared by Mr. John P. Briggs, of Effingham House, Arundel-street, Strand, were approved at the meeting of the town council on March 31st. The pulling down will commence directly after Easter, and the theatre will be opened on Oct. 3.

An interesting ceremony took place at Hull on Friday, on the formal transfer of the undertaking of the Kingston Gas Company to the City Corporation, the latter having purchased it for the sum of £92,500.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2258.

FRIDAY, APRIL 15, 1898.

CHANGES AND EXTRAS.

IT would be well if the architect, in preparing designs and contracts, contemplated the risks and difficulties attending upon alterations and "extras," and thereby saved himself and his client many heart-burnings. Some people wish to build before even they know what they really want. They employ an architect, it may be, accept his design, and forthwith give him instructions to obtain tenders without discussing with him the plans, or clearly defining what they really want. Their intentions are very obscure, and they apparently employ a professional adviser to assist them in making them clear, or putting before them something in black and white. We believe many people go to an architect simply for this reason, as they have no capacity themselves for realising their ideas. If they can be put on paper and presented in a pictorial way so much the better. Again, there is another large class of people who think they can build without any professional assistance. They have a certain idea of what they want, and imagine they can carry it into effect themselves if only they could get some one to help them in drawing out their ideas on paper or in assisting them in the technical matters. Both these sorts of clients come to grief; the latter sort, having "a fool for their client," often get hopelessly stranded. The "practical" Mr. Brown, or the commercially-minded Mr. Smith, who thinks he can save architect's commissions and buy his materials first hand in the cheapest market, the man who boasts he "knows a thing or two" about building, is often disappointed. Something or other he has omitted, even such a commonplace thing as a damp-proof course or a little care in protecting his basement from dampness or his upper rooms from drenching rains. How frequently the architect has been called in to examine a building erected in this way! A dispute arises about bad drainage—pipes whose gradient is faulty, or joints not properly made. In another case water comes through a basement wall or floor, which could have been prevented by the expenditure of a few shillings at the commencement, but now can only be effected by the rebuilding or pulling-up floors, and the cost of many pounds. Several failures in keeping upper rooms dry have resulted from simply not knowing the rule about a safe pitch for a slate roof, or the necessary lap, to say nothing of hundreds of other mistakes which an ordinary specification would have prevented.

But there are many legal difficulties arising from changes of contract, due often to want of clearness, and sometimes from a change of the client's intentions. A case of this kind was tried at the Glamorganshire Assizes the other day, and was reported in our last issue, where a firm of builders at Bridgend sued a solicitor of the same place for balance and extras, £771, due on a contract for building a residence from the designs of an architect. After this was commenced sundry alterations and additions were made; the defendant wanted to add a new wing, but the contractors refused at first to tender for it under the old contract, as they were dissatisfied, but eventually undertook the work, subject to arbitration, and an arbitrator was appointed. In the new contract the defendant only allowed the arbitrator to deal with prices and values, the architect's quantities ruling. The award was therefore given in a schedule of prices, but no total was arrived at. After the award was made the plaintiffs appealed to the defendant and his architect for quantities, but they refused to put them in; whereupon plaintiffs made up their own quantities, and applied the arbitrator's prices, which showed a balance due to them over and above the sum paid on account of new wing. Extras also were made up in the old contract of £394; but this exceeded the amount the architect said was due, and a further sum of £175 was deducted as penalties for non-completion within prescribed time, the residue being paid into court. The judge said that as the architect's certificate had not been set aside within the prescribed period, the plaintiffs could not go beyond it, and they were compelled to abandon £140 on this part of claim. As to the wing under the new contract, the architect certified for a sum much less than that of the arbitrator. After some further discussion, the judge said the action had been thrown away, as the figures might have been gone through earlier. Judgement was given for the plaintiffs for £412 12s., and costs, and his lordship ruled that the ordering of extras under a building contract did away with penalties, and disallowed the claim under this head. We refer our readers to the details in the report. But the result of the case is instructive. Here we have a contract which was being continually altered or invalidated by additions and extras which amounted to a considerable sum. The claim for damages for non-completion was disallowed, and the ruling that the ordering of extras did away with penalties is a lesson to all who try to enforce them after making additions and changes. The case is also instructive, inasmuch as the new arbitration clause only allowed the arbitrator to deal with prices based on the architect's quantities. We have here one way in which changes and additions to building contracts may lead to trouble and cost. Half the disputes in building are traceable to alterations and extras, and these are mainly owing to the want of a clear intention on the part of the employer at the onset. As a rule, these alterations and extras release the contractor from his obligation to finish the work by a certain date, especially when the extras have involved more time and have not been assented to by the builder. Numerous excuses for non-performance are made by some builders, such as waiting for a decision of the owner or his architect, halting for working drawings, heavy rains, frost, unfitness of premises to work in, bad soils; but there is no excuse more willingly taken advantage of than the ordering of extra work, or alterations in which extra labour is entailed;—it is so easy for a builder to plead that he has made previous arrangements, or ordered material which cannot be easily set aside without entailing extra cost and time.

MODEL SPECIFICATIONS. — VIII.

ORNAMENTAL BRICKWORK: ARCHES.

BRICK arches demand much care and attention both in the details and specifications. We show two or three sorts of arches in our sketches. Arch cutting and gauged work may be done slovenly or well. How many insufficient camber arches one sees in modern buildings, with badly set-out skew-backs, or the bricks slipping down! Camber arches ought to be set out on scientific rules from a face-mould, and proper bevels obtained for cutting the bricks. Unless the bevels are accurately drawn, the arch is a failure. Of course, this arrangement of arch bricks is not good or constructive, as there is no real arch in it, hence it is called a "scheme." The elliptical arch we give shows two ways of cutting the bricks. On the left side the proper and natural radiation of joints is shown from the three centres or foci of the ellipse, and on the right-hand side is shown a "scheme," in which the joints are all drawn from the centre of the opening *c*, irrespective of the curvature of the arch. According to this plan the lengths and bevels of each brick vary. This mode of jointing elliptical arches, however, is often followed by bricklayers, as it is supposed to look better for face work. The pointed arch illustrates also two ways of jointing. The left is the natural system in which every brick is of the same length, and is normal to the curve, while on the other side the arrangement is a "scheme." It will be noticed that by the first method the keystone bricks form a wedge in shape, but with a centre joint, as there ought to be in pointed arches. To obviate the wedge-shaped key bricklayers adopt the "scheme" method when the joints are radiated from one centre, and sometimes a key-brick "birdsmouth" in shape is introduced. It is, certainly, not so good to see the apex of a pointed arch formed with a stretcher on one side of the vertical joint and two headers on the other; but this can be avoided by adopting the wedge-shaped key of two bricks.

In specifying these, points ought to be mentioned or a sketch given. Niches are often introduced in ornamental gauged work, and care is necessary in cutting the bricks to insure good bond and to obtain proper bevels. The plan and elevation of this feature to a large scale ought to be given. We also show how a moulded brick archway may be formed. Many suitable patterns of jamb bricks can be obtained, and these can be combined to produce a pleasing arrangement of moulded members. The header bricks bond with the stretchers as shown in plan.

Our next group of sketches show a variety of ornamental gables for doors and windows, dormers and main gables, indicating the courses and jointing. A course of headers and stretchers may be used in the straight members of the lower mouldings, then a course of headers on each of the upper members. Many ornamental variations can be produced by curves, as in designs *c*, *d*, and *e*, and the tympana filled in by carved gauged work, terracotta, or enriched moulded bricks, as in Figs. *c* and *e*. Fig. *f* represents a panel with carved or cast ornament. Fig. *g* is a perspective sketch of a window-head with enrichment in frieze, suitable also for terracotta. In all curved mouldings headers are used.

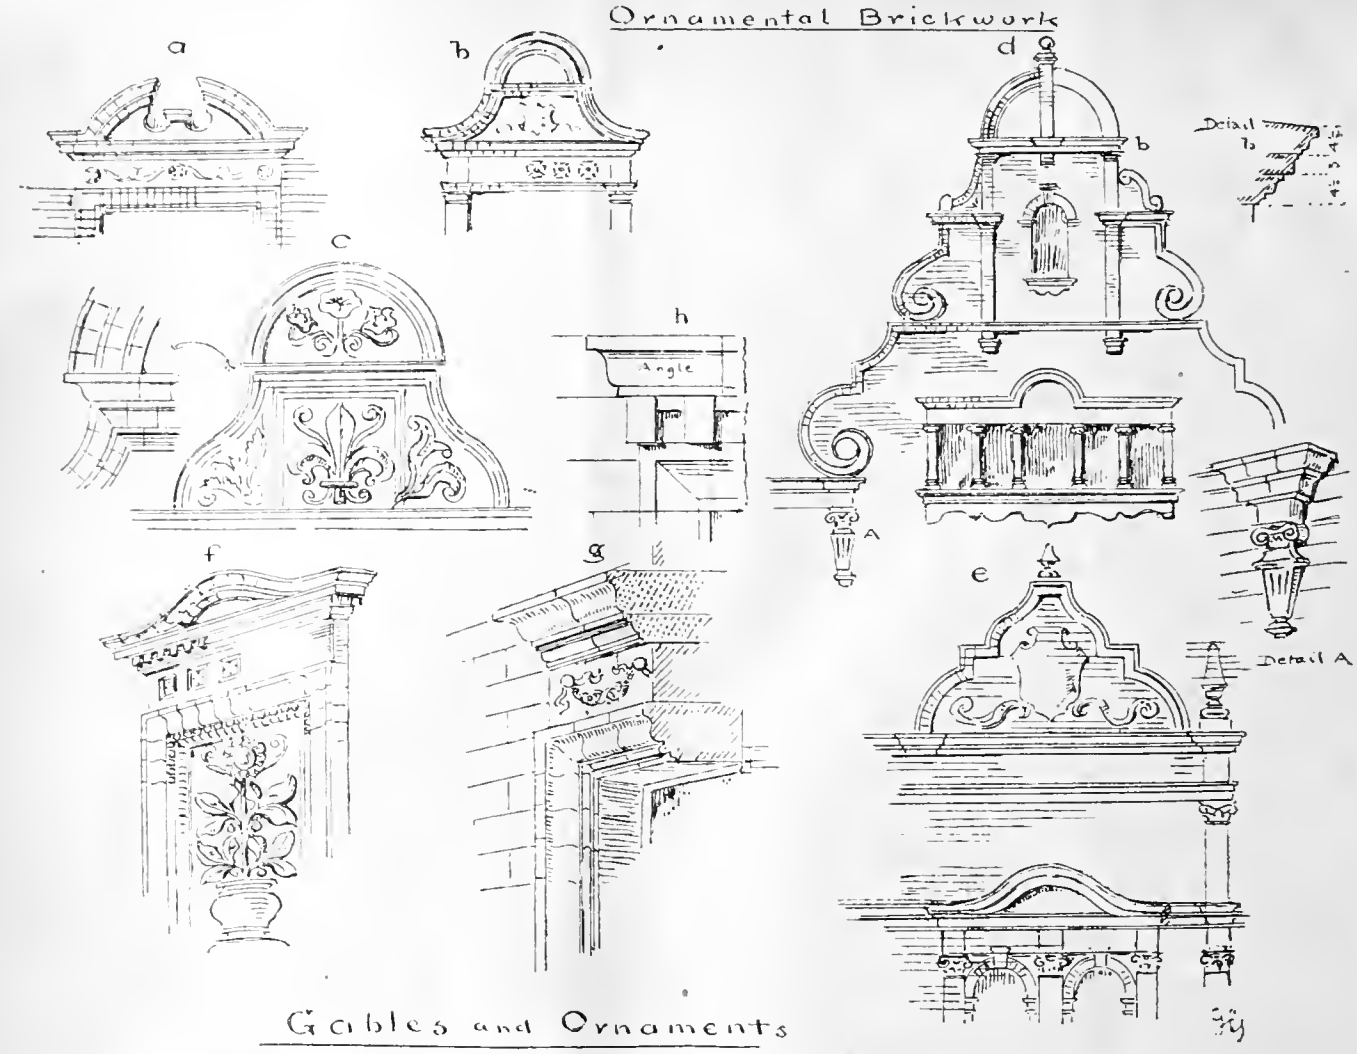
We have given a few clauses that are applicable to gables and moulded work round door and window openings; and these ought to be accompanied by detail drawings in special cases. Our sketches give a fair idea of the kind of drawing necessary to illustrate clauses of this kind.

We resume clauses for ornamental-brick gauged work. A clause may state generally of the projecting courses, that they are to be all headers, or as directed, and all the courses to be trimmed or rubbed straight and true.

11. *Pilasters.*—The pilasters to entrance to be of approved red rubbers, cut and gauged in cement, and of the projection shown. Or—
The brick pilasters to be cut and rubbed to the form shown, or fluted, and be set in cement or fine putty.

12. *Ornamental Panels or Carved Work.*—The tympana (or frieze panels) to be executed in squared and rubbed red-brick rubbers, set in shellac (or fine putty); the carving to be done to the architect's approval and to his design.

13. *String-Courses and Friezes.*—The string-courses to be formed of two (or three) projecting courses of section as in margin, of Brown's moulded bricks (or Lawrence's purpose-made moulded bricks), set in cement-mortar. Execute cornices (or string-courses) with moulded red bricks according to design, 12in. high and 5in. projection (or in three projections or courses), the second course being enriched (or name particular pattern of brick from Brown's or other catalogue), the other two courses moulded, the courses to be all headers set in fine putty to match facings or rake out and point. The ends to have proper mitres.



The following are clauses for gables and panels like those of *c*, *d*, and *f*:—

14. *Ornamental Gables.*—The gable panels shown in *c*, *d*, and *f* to be built in rubbed and gauged facings of Lawrence's best red rubbers, in Flemish bond, set in fine putty or shellac for carving.

15. *Ornamental Gables and Panels.*—Construct the gables of best red Fareham bricks (or red rubbers) laid in Flemish bond, rake joints, and finish with blue ash mortar with neat bevelled joints. The string-courses and curved mouldings to be in three (or two) projecting courses laid as headers in cement, weathered in cement (or the tops covered with two courses of plain tiles, breaking joint in cement, or the outer copings to be covered with 5lb. well secured to brickwork. The pilasters to be formed of moulded bricks projecting from face of work 4½in. (or 2½in.), with the strings and cornices returned round them, with moulded mitres at angles (as in *d*). The ornamental finials to be executed from detail with moulded bricks specially made. The voluted curves (in *d*) to be of moulded brick (or courses cut and rubbed) according to detail, the outer cyma moulding and corona being cut to die away on the eye of volute. The pendent pilaster and corbels (see sketch) are to be of gauged, cut, and rubbed brick neatly pointed in putty (or shellac), and carved.

16. *Ornamental Tympana and Friezes.*—Fill in the tympana of gable or panel (*c* and *f*) with brick enriched diapers or ornament in slabs 6in. (or 9in.) square, or of required dimensions according to architect's design (or the tympana to be executed in red rubbers carved, set with fine putty joints or shellac), and well grouted at the back in cement; or—

The frieze over windows (see *g*) to have (6in. or 9in.) ornamental bands, or swag ornaments in slabs according to design. Or—

17. *Ornamental Pilasters.*—The panels of brick pilasters to have plastic enrichments in 6in. (or 9in.) squares, fixed in cement with neat joints (or to be rubbed, jointed in putty, and carved).

18. *Sills.*—The window-sills of (No.) windows to be of two (or three courses), the upper one of splayed bricks on edge 7in. or 8in. projection, with moulded courses below of bricks of section in margin (or Brown's No. bricks) set in cement to 4½in. reveals and fitted ends. Or—

The sills to be of red splayed bricks (as design) on edge, all headers in cement to 4½in. (or 9in.); reveals, including mitred ends, neatly fitted.

19. *Under-Sills.*—Form under-sills in courses of cut and rubbed best red Farehams or Lawrence's rubbers projecting 1in. (or more) from face of work, closely set in putty, and grout in back, and carve lower courses to the design.

20. *Turrets or Oriels.*—The circular turret or oriel to be built in conformity with the plans and elevations, of 14in. brickwork, Flemish (or old English bond) all headers; in cement mortar. Proper templates to be made to the curve, which are to be approved by the architect or clerk of works. (Octagon turrets or bays should be also set out to a proper bond, and templates prepared to produce accuracy of work.)

21. *Moulded Arches.*—The arches numbered on plan to be constructed of red Fareham rubbers, according to the design furnished, in two or three rings in three recessed members, one behind the other, with moulded (or enriched) bricks of approved section. The rings to be accurately set out and turned and well bonded, and the arrises to be kept true, with fine joints set in cement mortar. Or—

The arches to be formed of the best red rubbers (or of Brown's bricks, Nos.) in three orders or rings, as shown in sketch. The rings to be accurately turned and set in lime putty. (If there are capitals, state whether of brick, terracotta, or stone.) If the arch is elliptical or Gothic, add: The arches or rings to be turned accurately with cut or rubbed bricks properly bevelled and set out in shed to the proper centres. (It is best to give the scheme or large-scale drawing of arch, showing centres).

22. *Bed all Stone or Terracotta.*—The brickwork to be well backed up and pinned to all stonework and terracotta, and bed build in, cut and pin all stone sills, lintels, steps, landings, corbels, &c., in cement. Or—

Neatly bed, cut, and fit all stone or terracotta dressings and arches. The terracotta work is to bond and course with the brickwork.

23. *Pointing Brickwork.*—Rake out cement joints and point brickwork of chimneys (or gables, &c.) with a flat joint in white mortar. Or—

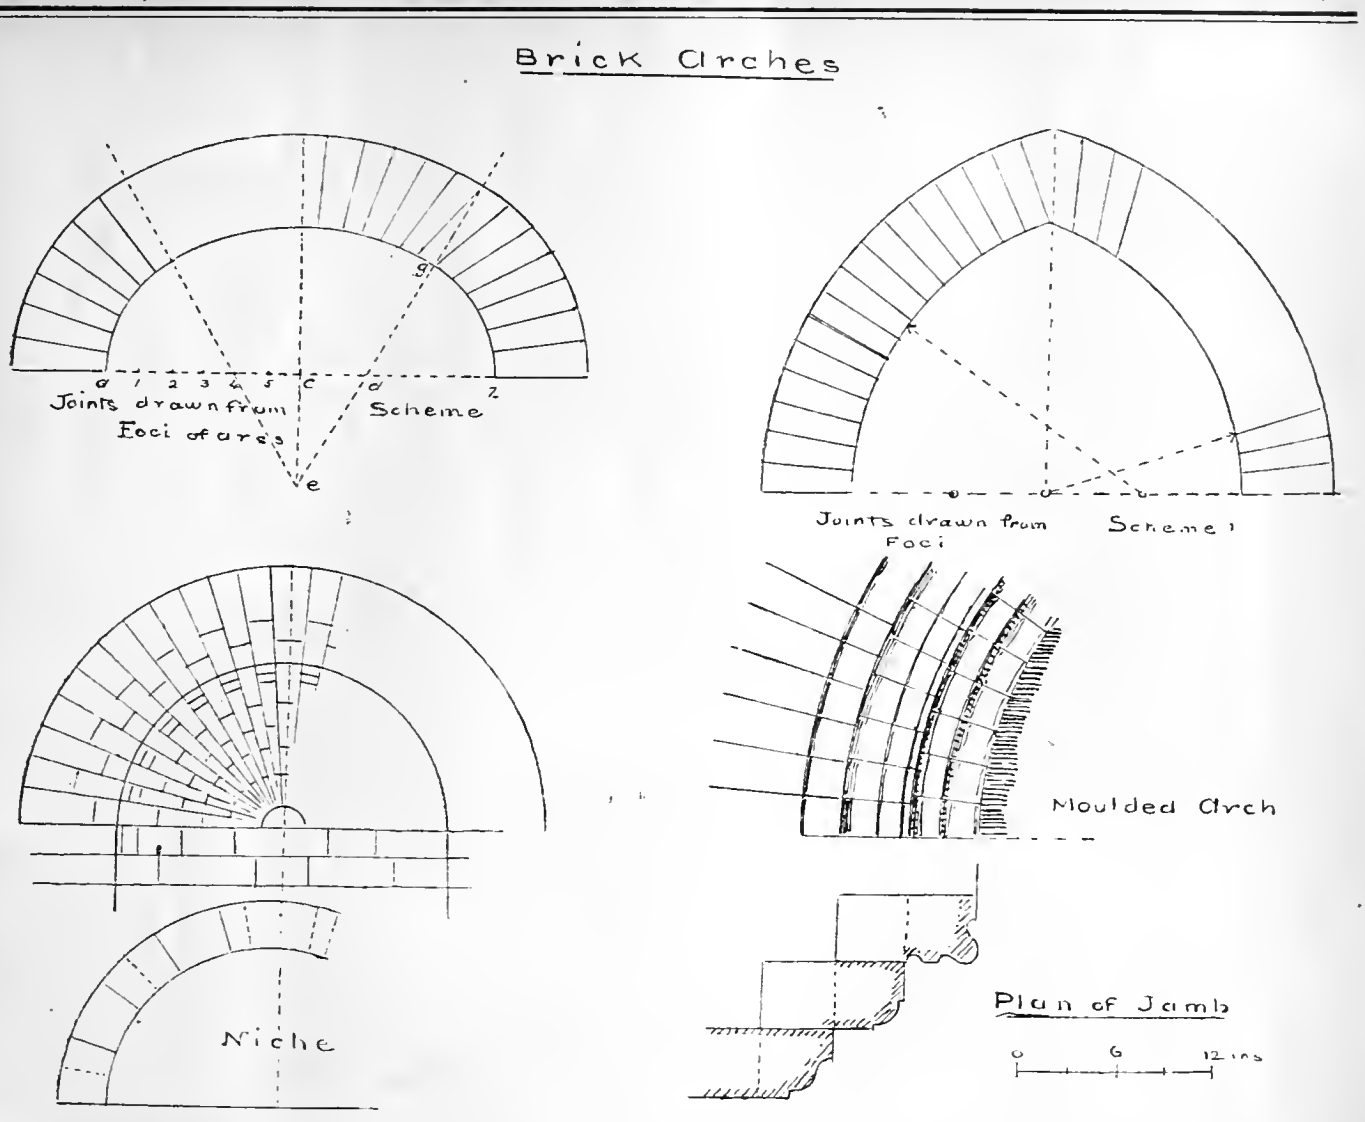
Rake out joints of chimney stacks (or parapets, or fronts) and point the brickwork in ash mortar with a flat joint. Or—

24. *Clean Down.*—Clean down brickwork, including terracotta and stone dressings, and point with a neat weather joint in cement cut on top and bottom.

We have referred to the statutory rules as to brick construction found in the London Building Act, having reference to chimneys and fireplaces (see page 442).

Other important clauses relate to bay windows to dwelling-houses, which provide that no bay window in a street of not less than 40ft. is to exceed three stories in height above level of the footway, and is not to project more than 3ft. from the main wall of the building to which it is attached; is not to project within the prescribed distance of the centre of roadway, and is not to be nearer in any part to the centre of the nearest party-wall than the extreme amount of their projection, and is not to exceed in width three-fifths of the frontage of the building fronting the street (see section 73). Oriel windows and turrets are also regulated as to projection and height above level of footway in streets of not less than 40ft. wide. No part of the projection is to extend more than 3ft. from the face of front wall of building or more than 12in. over the public way, and no part of it is to be less than 10ft. above level of footway, nor within 4ft. of the centre of nearest party-wall where it overhangs the public way, and it is not to exceed in width three-fifths of the length of wall on the level of that floor.

The rules as to bressummers (section 56) and those relating to the height and thickness



of parapets (57) are important. Rules as to chimneys and flues (64), flues and ovens, chimney-breasts, fireplace openings; thickness of upper side of flue when at a less angle than 45°, arches under public ways (72), we have already given.

"BUILDING NEWS" DESIGNING CLUB.

A SEASIDE CONVALESCENT HOME.

THIS has proved a popular subject, calling forth a considerable amount of good work and no little skill on the part of the competitors. The scheme is not realised perhaps in any one plan so entirely satisfactorily as to justify unqualified approval; indeed the critical reader is little likely to be content with the plans which we have placed first and second, as both of them are too involved to merit description as typical samples of good planning. To make a really simple plan which shall be economical of space and architecturally composed, and at the same time provide for a somewhat complex variety of requirements in a suitable manner, necessarily implies a degree of experience which we do not expect to find usually among the members of a designing club like ours. Consequently, we are prepared to make more allowances possibly than the critic whose lofty eminence sometimes at least may account for the severity of his criticisms. These must be taken in good part by the student, and the same degree of forbearance should be accorded to our remarks in reviewing the plans submitted. It is always so easy to find fault, and the architect cannot expect to be spared more than the painter, the poet, or the sculptor. The engineer escapes blame more than the architect, because the mysteries of construction mystify the ordinary man in the street, and technical expressions, to say nothing of clever-looking calculations, fortify their professors against cheap criticisms. An architect's work, on the other hand, is always associated somewhat directly with questions of taste, and everybody in such things more or less makes a claim to infallibility. The less qualified the judgment, the more absolutely is it as a rule asserted. There is this to be said, however: that occasionally the want of knowledge on the part of the critic enables him to make a very useful criticism well worth remembering on another occasion.

The conditions under which these designs for a Convalescent Home were prepared, ran as follows:—A Small Convalescent Home for 24 men, by the seaside, on a site overlooking the shore at the head of the cliff, where the land is practically level. The position is exposed, and the building, which is to be built in local coursed stone, must be planned accordingly. The aspect is south-west on the sea-front side. The accommodation is to provide a dining-room, recreation-room, small writing-room or library, two dormitories, a superintendent's residence, comprising parlour, adaptable as an official room, a living-room 14 by 14, or of that area, a kitchen, scullery, and offices. A bath-room with two baths, lavatory with 12 basins; five w.c.'s and urinals, for the use of the inmates; also a boot-room, a cloak-room, and box-room. The whole of the accommodation is to be provided on the ground floor, excepting one dormitory and the superintendent's two bedrooms and two bedrooms for the female servants. A house-yard and small laundry, well separated from the patients' departments, to be provided. The building is to be suitable for 24 men, exclusive of the staff. The roofs to be covered with tiles. The style is to be suitable for stone. Two plans, two elevations, one section, and a view. Scale, 8ft. to the inch for elevations. Plans and section may be drawn to 16ft. to the inch.

We put "Centaur" first, "Dachs" second, and "By Go" third. In arriving at this conclusion we take, of course, the external treatment as well as the plan into consideration, and in a case such as this, where no money limit is named, the appropriateness of the approximate outlay for the purpose in hand should govern the determination of the award. "Centaur" is the best, and his strongest points are to be found in his elevations perhaps, and in the suitability of the contemplated cost. It would be no difficult task to pull his plans to pieces; as, for example, the attic character of the upper dormitory is a decided defect. The want of lavatories and baths on both floors is to be noted, particularly as the whole of this part of the accommodation on the ground floor is cramped, and inconveniently restricted. It is an advantage to be able to shut off the dormitories from the rest of the house, at the same time securing an approach to the w.c.'s, so that they are available for day or night use conveniently. The superintendent's rooms are not badly placed, though the w.c. on the first floor would have a very conspicuous soil-pipe next the main entrance and up in the air in front of the dormer.

"Dachs" is more ambitious, and more expensive in his scheme, though he gives seemingly a better dormitory with big windows on the first floor. To balance these, however, the small "spare bedrooms" have similar dormers which are out and away too large for these small apartments. On the other hand, for effect sake, the superintendent's bedroom and the matron's room have squat and rather unsuitable windows, and these again are in marked contrast to the linen-room window. The w.c. accommodation is inadequate, and a through draught should be provided by windows in the lobbies between the lavatories and the closet blocks. These last can only be reached through the house, which is a mistake. Another fault is the necessity of patients from the lower dormitory having to go through the main hall and up the staircase facing the front door to reach the bath-room. The dining-room and recreation-room are best in juxtaposition. The bay window to the last-named room is not done justice to in the perspective. "By Go," the third man, is painstaking, and aims at some spirit in his design. Yellowish paper is contrary to the conditions, which specify white, because drawings on white paper reproduce better. He pays the penalty, for we do not print

his design, as possibly we otherwise might have done. The central garden in his plan is a pretty and useful idea, though on account of the aspect being north-east, it is to be feared the sun would not often reach this garden. The hall is in keeping with the ambitious and hotel-like idea of the arrangements generally, which are clever, but wasteful in passages. The elevation misses success somehow, though we observe an endeavour to avoid elaborate features. This failure may be due to some extent to the ugly splays over the square hayseut of which the canted bays rise. The sprawling segmental arches inclosing the shallow verandah are uncouth and ugly. "Pantile" has a sense of the picturesque, but this convalescent home is not one of his best efforts. The building has somewhat the appearance of a farmhouse in the view, and on the road front the central part looks like a tavern. The plan has been sacrificed to the elevations, and we do not like the long corridor. The first-floor dormitory would be a cheerless room facing the north by east, and its windows are very low down. "Saxon" works in the same school as "Dachs," and in some ways his work is better; but we do not like the way in which he mixes up the dormitory traffic upstairs with the servants' apartments. The patients' w.c. is at one end of the landing, and facing it at the other end is the servants' w.c. The superintendent's bedroom is between the two. Externally the design shows taste. The dormitories have cubicles, and downstairs the windows are high up under the eaves. Upstairs the windows are not so clearly delineated, and where they appear on the plan they are left out in the sectional elevation, the only place where they ought to show. "Petticoats" has one of the best plans on the board, and it looks rather practical; but we are unable to express approval of his elevations. They are so unshapely, and in the view might be mistaken for a cricket pavilion. The belvedere tower is a good idea, not very effectively realised. "Caedmon" has a compact plan, with a quaint, unsophisticated elevation marked by an odd bay, which attracts our attention. The entrances to the house are bad, too cramped, and in both cases too much connected with water-closets. The interior arrangements are very mixed, and not good. "Bernard" shows an original endeavour, overweighted with circular forms in plan, clever in a way, and uncommonly ingenious, though carelessly completed; his inky view would ruin any chance of success. The sea-front looks like a salt-water bath house. The plan is crowded, and not convenient. "Mantom" (H. R. C., we cannot really read your motto) has a quiet design and workable plan, making the building in appearance more like a school. The sanitary arrangements are better than in most of the other schemes, and both floors have lavatories, &c. The bathroom is on the upper story. The drawings are carefully and properly worked out; but they are not very attractive. "Ivy" sends an odd design with a pavilion at either end of a long line of roof. It is drawn rather crisply; but the plan is ill-considered, and crude in its parts. The stairs leading up to the servants' bedrooms rises almost immediately outside the doorway opening into the men's ground-floor dormitory. This is not suitable isolation. "Hotspur" has a plan with several points of merit. The S.W. front is partly in half-timber work, but on the N.W. side a sort of Scotch style in stonework is adopted. The ingle-nook in the inner hall would serve no purpose, and the plan generally would be improved by simplification. "St. Catherine" comes next, and has a dormitory in the roof with dormers, after the manner illustrated in the design placed first. The superintendent's living-room is located as far away as possible from the kitchen and administrative part of the premises. "Swan" cannot say his design is graceful, and the upper dormitory, leading out of the lower one, is most objectionable. "Olliwops" draws in outline a design which is not devoid of meritorious simplicity; but we do not praise his plan. The main passage of the house gets its light and ventilation on one side, at any rate, from the lavatory and urinal department. This is not nice. "Notts" has a squat porch to the main entrance leading into a square hall, in front of which is the dining-room, so that all the food from the kitchen necessarily must be brought into the entrance hall. "Alesia" sends a bird's-eye view which hardly helps his chances. Both dormitories are badly planned, with two beds in the centre. Each has a nurse's bedroom attached, and also a bath-room, lavatory, &c. The dining-room is not well placed with regard to the kitchen. "Tee Square" marks his design by a square dwarf tower. The composition is quaint and unusual, but the drawings are thin and poor. "Rydal" comes next, then "Klondyke" (whose view is only partly done in pencil), "Cobden," "Giaour," "Crow," "Lany," "Derige," "Strax," "Suburb," "Angler," "Stanley," "Nowhere," "Gib" (a very neat and thoughtful design falling short of the success it aims at). "John Bull" is neatness itself; but his scheme is not well contrived, and the domestic arrangements are too intimately intermingled with the patients' rooms. "Don't Know" should improve his draughtsmanship. The triangular Gothic porches against the canted dormitory and dining-room are strangely out of place. "Oak" has much to learn, and so has "Chuckle," who ought to draw better than in this careless sheet. The last plan is marked "Chess."

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXXVII.

(concluded.)

Light buildings of steel have the advantage over those of masonry, of cheapness, and rapidity of erection. A temporary or a permanent building can not only be erected at little cost in this material, but it can also be pulled down and re-erected elsewhere at any time. This is a consideration in the case of growing firms, enabling them to locate their shops in different localities from time to time, as may seem most suitable for the work in hand. The deep and broad foundations necessary for a superstructure of masonry are not so essential for light iron structures. Attachments for machinery are also made much better to iron than to stone or brick. There is one important use of steel, of which we know nothing in this country—namely, as a material of which the skeletons of tall buildings are constructed. These are built in America from 12 to 20 stories high, attaining a height in some cases of 280ft. to 300ft. In these the masonry is like that on our own Tower Bridge, simply a facing or covering for the gaunt anatomy beneath; for the joists, columns, channels, angles, tees, and gussets which are built directly upon the foundations upwards, and which sustain the whole of the stresses due to weight and wind pressure. These buildings are the work of specialists, both architects and engineers, since the problems to be faced are of a unique and special character. Maximum of space, with minimum of weight, have to be duly balanced, and the provisions for the elevators, and the motive power by which they are operated have to be made. Ten or a dozen elevators or more will be operating in a single large building. Rapidity of erection also is often a problem to be seriously considered where land is costly and rents high, while the probability of future modification or extension may have to be borne in mind. Without steel, and without the modern quick elevator, these tall buildings could not have been economically constructed.

The value of steel as a material for structural purposes is not to be measured alone by the massive work which has been considered. In two other directions developments have taken place which would have been impossible if iron alone had been available. Steel ropes and expanded metal have each a future, and are destined to exercise immense influence in the construction of public buildings and engineering works. Without wire rope many of the great engineering feats would have been more costly and difficult than they have been. The Sukkar Bridge over the Indus is one case only in point. It has a span of 820ft., and a breadth of 79ft., and it was erected by wire rope supplied by Messrs. Bullivant.

Though expanded metal has been only about nine years before the public, its uses and applications are already very numerous. Both as a binding element of strength in concrete work, and as a protective agent against fire, its merits are beyond question. Yet metal could not be stamped and expanded if there were no mild steel. Wrought iron could not stand such stretching without fracture, and though the best iron might be expanded to a very small mesh, the continuity of the fibre would be short in one direction, and the strength in the direction of fibre much less than that of steel. In the protection of buildings from fire this material will probably play an important part, for it is not only in itself fire-resisting, but it is not open to the objection of being subject to expansion under heat, like continuous sheets, because the reticulated form permits of local expansion, and the concrete or cement is, therefore, not so liable to flake off. It is consequently a suitable material for incasing cast-iron columns, steel joists, and girders, and for the bases of floors and party walls. The very great increase in strength which it affords to concrete arches is remarkable. It affords an excellent binding element or key for cement enrichments, becoming at once a fireproof protection, and a basis for ornament. It is not possible to say to what extent this metal may not ultimately be employed. Wherever a binding material is required in concrete and cement, the qualities afforded by this must give it precedence of the older ones. Interwoven with wire studs, it makes a practically solid structure without the drawbacks incidental to the use of solid sheets of metal. It is made in sheets up to 8ft. square, in various thicknesses, and in meshes from ⅜in. to 6in. The thicknesses range from 24 B.W.G. to ¼in. The expansion is from two to twelve times the original width of plate, according to the size of mesh and width of strands. The numerous applications of this metal in buildings are already tolerably well known, and need not be further dealt with here. It may be noted that expanded metal, and the machines for making it, are American inventions.

The weights of iron and steel work afford a rough basis upon which estimates are made. To go through the detail weights of a large structure seems a very formidable task; but it is facilitated by the use of tables which give weights of sheets, plates, and of the various sections. Then, further, it is often possible to cover a large quantity of detail in a short time when there is much similarity or repetition of outlines and sections. There is a knack in getting out estimates quickly, previous experience being a very sure guide. Parts which are similar, even though not identical, afford a sufficient aid to the making of approximate allowances, greater or less in extent. Formulæ are given with a view to facilitate such calculations, but they have to be used with caution, since they mislead if applied in cases which are not absolutely identical. The only safe rules are those which deal with the details of a structure instead of a structure as a whole. And since built-up work is nearly always built wholly of sections which have uniform cross-sectional areas, and as these are repeated many times, the safe way is to go through a little detail, taking a given section, and multiplying the weight of that by the number of similar ones.

Trautwine gives a simple rule for weight. In beams of wrought iron, of any cross-section, provided it be uniform—

> The weight per lineal yard in pounds = area of cross section in square inches × 10.

And—

> The area of cross section in square inches = weight of beams per lineal yard in pounds 10.

It is not safe to base an estimate on weight alone except with reference to a previous similar structure. That would be very misleading, notwithstanding that price is often given at so much per ton. But prices must vary exceedingly with the quantity of work involved and the quality of the workmanship. The first named varies with design, so that structures which are built up in a simple fashion may not cost half as much as others of the same weight, built up in a different way. The details of the design of a bridge depend partly upon the cost of material and the weight. Thus in a very long bridge there would be greater reason for the saving of weight than in a short one, and the aim would be to build up its members of sections, which would give the minimum of cost and of weight, even though it might happen that the cost of labour might be somewhat increased.

In designing work of an extensive character, it is desirable, for several reasons, to adopt uniformity in detail as far as is consistent with considerations of structural suitability and of strength. It will often happen that this will involve some redundant strength, or some slight redundancy of details in certain sections. But from the point of view of economy in cost, and of facility of erection, such a course is politic. The work of manufacture is facilitated by the introduction of repetitive details, and better workmanship is often possible, because it pays to make special

appliances and rigs-up for the purpose of improved manufacture of large quantities of identical parts.

The inspection of workmanship differs in some respects from the testing of materials. The latter can be carried out by a man who has little acquaintance with the former. To judge of workmanship, one must have some practical experience—and the more the better. Among points to be noted are the following:—

The proper bedding of all faces is important, because lessening risk of initial strains; cover-plates, angles, tees, &c., in flanges, in stiffeners, and attachments of members must be close fits if a structure is to be stable. Planed edges, the closeness or otherwise of joint edges, are to be observed. Whether girder-plates have been properly levelled, or angles, tees, &c., straightened, or regularly curved as the case may be, can be observed in finished work; departure from accuracy in these respects being detected by the crookedness, or the winding of the built-up structure. Welds and sharp bendings should be looked after closely. All angle- and tee-stiffeners of rectangular form, all angles and tees turned to quick bends, square, and acute, are welded at the bends, on the flat webs by the insertion of glut pieces, or of lapping joints. These corners, on which a good deal often depends, must be looked after for signs of imperfect welding, being tested by observation and by hammer-blows. A point on which stress is laid in high-class work is the neat finish of flush outer edges. It is not a matter affecting strength, but it is nevertheless insisted on by good engineers. The time spent in finishing such edges is considerable if they have to be done after the riveting-up of the work. The aim, therefore, always should be to get them as true as possible before riveting-up, and to effect the latter with such accuracy that the edges will not be pulled out of truth by the rivets. It is a question mainly of shop methods, and neat work becomes as easy of accomplishment then as the rough workmanship which discredits some structures. The hot iron and cold iron saws are among the most valuable machines in a bridge and girder yard. They will cut ends as accurately as they can be planed, and either square or to any bevel. They will cut bar, plate, flat, or any section within the range of their capacity generally much more quickly than the work could be done by planing, because the saw makes but one cut, no matter whether $\frac{1}{4}$in. or 1in. has to be removed.

Edges and rivet-holes resemble each other in one particular—namely, that the inspector has in all contracts, except those of the cheaper and rougher classes, to see that edges are planed, and the holes drilled or reamered. Sawn edges are equivalent to planed edges, and reamering is often held to be equivalent to drilling. Practice, however, differs in regard to the latter, and here, too, it is often a question of shop methods. With due care a punched and reamered hole is just as good as a drilled one. But then that depends on how the punching is done, and on the extent of metal removed by the reamer. Rivet-heads must be noticed, whether they are sound or cracked. The latter must be cut out and replaced. Note must be taken that bolts are properly made, threads cut cleanly on tie-rods, nuts a good fit, eyes well made, and other kindred points which a practical man will understand. The inspection of wrought-iron and steel construction work like that of cast work should go on simultaneously with the work; the workmanship must be observed as the work proceeds, because many imperfections are not readily detected, some not detected at all in a completed structure. Flush holes, as against overlapping holes, and drifting can only be noted properly during the progress of the work. Also, that rivets fill their holes properly without drifting.

The difficulties of erecting large works are often far greater than those involved in their construction in the shops. In the shops and contractors' yards there is generally plenty of tackle available, cranes, travellers, staging, blocking, shear-poles, and skilled help. In erecting work it is very often the case that there is no precedent to guide one: conditions are peculiar, and perhaps unique. The weight of responsibility is correspondingly great; life and property are at stake, and frequently work has to be done against time.

J. H.

The Todmorden School Board are about to erect a new school at Cornholme, on the Worsthorne estate, at an estimated cost of £5,000. The architect is Mr. Jesse Horsfall, of Todmorden.

IMITATION VARNISHES.

By imitation varnishes is meant compounds that are prepared without the aid of heating the resins to dissolve them. In the "good old times of yore" it was the custom to distil or roast all resins, so as to effect their solution in oil and turpentine for the production of varnish. Nowadays, however, many resins are dissolved by chemical means, precipitated from the solution, and the precipitate thus readily forming a solution in the usual menstrua used in varnish making. The chemical process of dissolving resin consists in boiling the resin with a caustic alkali, such as caustic soda lye, by which means the resin is dissolved and taken up in the fluid. To precipitate it again in the solid form, the alkali of the fluid is neutralised by the addition of an acid, whence the resin is precipitated, and can then be collected, washed, and dried. Such precipitate is very soluble in linseed and other oils, turpentine, &c., even in the cold. Inasmuch, however, as the compound formed by dissolving the precipitated resin in oil or spirit is not a perfect varnish, as it exhibits feeble drying powers, it is customary to precipitate the resin from the alkaline liquid by the addition of some salt of lead or manganese that possesses siccative qualities, such, for example, as chloride or sulphate of manganese, sugar of lead, &c. The addition of these bodies to the alkaline solution of resin precipitates the resin, and at the same time these salts combine with the precipitated resin, and thus convey the siccative quality to the varnish which is made from such resin. The quantity of the precipitating agent has to be regulated, as only a definite quantity can combine with the precipitated resin, and any excess would simply become mechanically mixed therewith, and prove an undesirable component of the varnish, inasmuch as their presence renders the varnish dull and turbid. The general process of preparing these "resinates" is thus: a resin soap is made (by precipitating the powdered resin with the caustic soda) &c., and the solution thus obtained is mixed with a hot saturated solution of one of the salts above named, the nature of the metallic salt determining the nature of the resinate produced—e.g., whether resinate of lead, manganese, &c. After mixing the metallic salt and alkaline solution of resin, stirring, and allowing the mixture to rest, the resinate will rise to the surface of the fluid in a curdy mass. This is skimmed off, washed in warm water to free it from all traces of alkali, and then dried in hot air.

The resinate contains from 12 to 20 per cent. of oxide of lead in a soluble form, and of oxide of manganese about 10 per cent. Sometimes both manganese and lead salts are used together in precipitating the resin, whereby a double resinate is obtained, 7 per cent. to 9 per cent. of lead oxide, and $1\frac{1}{2}$ to 2 per cent. of manganese being used in making this. The washed and dried resinate is in the form of a powder, and all that is needed is to dissolve same in the oil of turpentine.

Another form of this resinate is obtained thus: The resin is liquefied by melting it by heat, and after keeping it melted for some time, adding 10 per cent. of litharge or 5 per cent. of precipitated oxide of manganese, and continue the heating until all, or nearly all, the metallic oxides have been dissolved. The above proportion of oxides should not be exceeded, as any excess would remain undissolved in the varnish, and spoil its appearance. The resinates thus prepared are then mixed with the fluid vehicles used in making varnish. Instead of adding metallic salts to the resin, they are sometimes added to the oil vehicle, whence there is formed a linoleate. This process consists in saponifying the oil by boiling it with caustic soda lye, and then adding the soapy solution thus made to a solution of sugar of lead or chloride of manganese. When the linoleate is precipitated, it is collected, washed with water, and dried. Sometimes the linoleate is heated until it melts. Lead linoleate may contain 20 to 22 per cent. of lead oxide, and manganese linoleate 9 to 11 per cent. of manganese. The method of using these linoleates and resinates is to heat raw linseed oil to 300° F, and then add 5lb. of the resinate or linoleate drier per gallon of oil, and stir the mixture until dissolved; this liquid drier is then added to the bulk of the oil, which should be heated 230 to 250° F., and if required the oil can be further oxidised or boiled. The oil varnish thus made is very useful and cheap.

A quickly-made copal varnish is one prepared by dissolving the copal resin in a compound solvent. As is well known, some varieties of copal resin are very difficult to dissolve, and the usual process is to melt them or soften them by dry distillation before compounding the oil and resin; but by means of a compound fluid, consisting of equal measures of bisulphide of carbon, oil of turpentine, and benzole, the copal resin may be readily effected. The proportion of the solvent fluid to use is two parts by weight to one part by weight of the resin. The mixture is made in a closed vessel and allowed to stand several days. The solution thus obtained is decanted in this mixture with a fat oil.

Soap varnishes are also useful for common purposes. They are prepared by dissolving a good tallow soap in boiling water until a clear solution is obtained. This is filtered several times through felt filtering bags or cloth while it is still hot. The solution is again heated and diluted with an equal bulk of water, then a boiling-hot solution of alum is added to it so long as a precipitate (a sebate of aluminum) is formed. The precipitate is allowed to settle, the supernatant liquid poured off, and the precipitate washed several times with boiling-hot water. Then it is dried and heated in a vessel standing in boiling water until it becomes transparent. In a separate vessel oil of turpentine is heated to nearly the boiling-point, and then sufficient of the aluminum soap is added to form a solution of the consistency of thick varnish. If this becomes too thick when cold, it may be thinned with hot oil of turpentine.

H. C. S.

THE ELECTRICITY SUPPLY OF LONDON.

At the ordinary meeting on Tuesday, April 5, of the Institution of Civil Engineers, the paper was read on the "Electricity Supply of London," by Mr. Arthur H. Preece, A.M.I.C.E. The supply of electricity on a commercial scale had been started in London after the passing of the Act of Parliament in 1888, which amended the Act of 1882, principally by extending the date for compulsory sale to the local authority from 21 years to 42 years. In 1888 many companies applied for Provisional Orders, and, in determining which were to be granted powers, and the districts over which the powers were to extend, the Board of Trade decided that competition would be advantageous to the public, and that it was advisable to allow one direct-current system to compete with one alternating current system. There were now in London eleven important companies and five vestries supplying electricity, and three other companies and three vestries were taking steps to start works. The capital invested in the industry amounted to £6,000,000, and plant was installed to the extent of 80,000H.P., the equivalent of 2,000,000 8c.p. lamps being connected to the mains. The total annual revenue was £300,000, and the total annual expenditure £150,000. Of the systems for supplying electricity in London, the alternating current was applicable to large areas where consumers were scattered, and it enabled the generating works to be established by the riverside, or where land was cheap and coal was easily unloaded. The undertakings using this system were the City of London Company, the Metropolitan Company, the London Electric Corporation, the County of London Company, the House to House Company, the Hampstead Vestry, the Islington Vestry, and the Hammersmith Vestry. The direct-current systems were divisible into two classes, the high pressure and the low pressure. In the former rotary transformers were used to reduce the high pressure, while the latter produced and distributed electricity at the same pressure at which it was supplied to consumers. The direct-current systems were applicable to compact areas, and, with the use of high pressure, to scattered or isolated compact areas. The chief advantages of the direct-current system were the possibility of using storage batteries, which could not be employed with the alternating-current systems, greater efficiency in distribution, and greater adaptability to motive power. The undertakings using the system were the Chelsea Company (high pressure), Charing Cross and Strand Corporation (high pressure), the Westminster Corporation, the St. James's and Pall Mall Company, the Kensington and Knightsbridge Company, the Notting Hill Company, the St. Pancras Vestry, and the Metropolitan Company (at one works). The generating works of the several undertakings in London contained many interesting features. No less

than twenty different works had been erected. The boilers used comprised the water-tube, marine, Lancashire, and miscellaneous types; but the preference for the water-tube boiler was very marked. The works were liable to sudden demands through fogs, and the quick-steaming properties of this type of boiler were of great advantage. The boilers were fired chiefly by hand with Welsh coal; but in the works of the City of London Company and the County of London Company mechanical stokers and cheaper coal were used. The use of extensive systems of steam-pipes was now being dispensed with. The multiplicity of valves was unnecessary, and the number of valves was being reduced, and arrangements were made as simple and with as few joints as possible. The present tendency was towards engines of the marine type for large outputs. The high-speed engine was not used for larger powers than 750H.P. Some engineers, however, found engines of 3500H.P. sufficiently large, and the most convenient unit to adopt. The dynamos were similar in most works, and were always connected direct to the engines. Storage by secondary batteries was not extensively employed in London, as their maintenance had hitherto proved expensive. But a few works used them entirely for maintaining the supply after midnight, and in the daytime in summer. The author gave the results of a test of a small marine engine and alternator, showing the combined efficiency to be 85·5 per cent. The question of vibration had been of great importanee in many works; no cure had been found effective when once vibrations were set up. High-speed engines must have three cranks to be free from appreciable vibration. The favourite methods of distributing electricity were to transmit current at a high pressure in heavily-insulated cables in iron pipes, and current at a low pressure in insulated cable in stoneware conduits or in cables heavily armoured and laid direct in the ground. Rubber was now little used, paper and jute, impregnated with insulating compounds, having been extensively adopted. The usual system of measurement of the electricity supplied was by meter, and the average charge was 5½d. per unit. The average charge in 1890 was 7½d., so that the price of electricity had been reduced in eight years no less than 25 per cent., equivalent to a reduction in the price of gas from 4s. to 3s. A curve was given to show the variations in the price of gas since 1870. The average price had varied between 4s. and 2s.; it was now 2s. 7d. The cost of generating and distributing electricity had been greatly reduced in the last few years. In 1892 it was seldom supplied for less than 4½d. per unit. The usual cost was now 2½d. to 3d. The actual cost of generating was about 1½d. per unit, and the cost of management, &c., about 1d. The direct current was everywhere produced at a cheaper rate than the alternating current. The difference was between ½d. and 1d per unit, or 20 per cent. cheaper. Since 1888 an important inquiry had been held by the Board of Trade regarding the maximum pressure permissible in customers' premises. The result of this inquiry, in 1896, was to increase the pressure from 150 volts to 250 volts. A comparison was made between the two largest companies in London—namely, the City of London Company, which supplied alternating current, and the Westminster Corperation, which supplied direct current. Both companies had nearly the same number of lamps connected to their systems, the number of 8c.p. lamps connected being 270,898 and 269,939 respectively. The capital expended was respectively £945,829 and £546,434; the annual incomes per 8c.p. lamp, 11s. 9d. and 7s. 9d; the annual expenditures per 8c.p. lamp, 4s. and 3s.; and the costs per unit, 7·6d. and 5·8d. The industry was growing so rapidly that most undertakings had to seek new sites for generating works, and the tendency was to erect large works on the outskirts of London, where coal could be conveniently brought to the site, and where water could be obtained for condensing. The powers granted under Provisional Orders were limited as regards the compulsory purchase of land, and further powers were being sought by some companies from Parliament, so that they might be placed on the same footing as railway companies. No less than 40,000H.P. was now being installed in London in order to meet the demand for electricity in the immediate future.

The new buildings for the University Extension College at Reading will be opened by the Prince of Wales on Saturday, June 11.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XXI.

By an Assoc. Inst. Elect. Engs.

CIRCUIT TESTING.

As the wiring of buildings is generally given out to contractors, it is of the utmost importance that the architect in charge should be able to test the complete installation before passing the same. It will, therefore, be necessary to refer to some simple everyday tests, which should be made both during the wiring and after the wiring is finished, and since so much depends upon the quality of the work, there is room for improvement in the matter of testing electric circuits, and it is hoped that cheap and inferior work may become a thing of the past as architects gain experience in electrical testing. The following are important tests with which architects should be conversant:—(1) *Continuity Tests*; (2) *Insulation Resistance Tests*; (3) *Leakage Current Tests*; and (4) *Tests for the Localisation of Faults*.

Continuity Tests are made during the wiring of buildings by the foreman in charge, and consist in forming simple closed circuits in which are connected in series a sensitive detector galvanometer, a battery (consisting of a number of cells in a portable case), and the parts of the circuit containing the joints to be tested. The deflections obtained by the galvanometer give some indication of the quality of the joints, and the continuity of the current is tested. This test, of course, gives no idea of faulty insulation, or the existence of earth connections, and it is, therefore, advisable to also make tests for *earths* and *short circuits*. For these tests the further ends of each branch are left perfectly free, the near ends being in turn connected in series with the detector and battery to earth. Should any earthing exist the galvanometer needle will be deflected. For short circuits the near ends of the lead and return wires should be connected by means of the galvanometer and battery (the further ends still being free). If a deflection is obtained, then it is clear that a short circuit exists, or that there is a partial connection between the two wires.

Insulation Resistance is the obstruction presented to the passage of electricity to the earth by the insulation covering of the conductor, and since it is essential to confine electricity along the definite paths formed by the conductors, so as to avoid loss and danger from leakage currents, insulation resistance should be very high. It is, therefore, usually expressed in megohms (million ohms), and since it is proportional to the thickness of the insulation and inversely as the length, the insulation resistance of a mile of the cable is taken as the standard of reference, and insulation resistance is therefore expressed in megohms per mile. Thus, if a cable has an insulation resistance of 300 megohm-miles, the insulation resistance of a half-mile of that cable would be 600 megohms, and that for two miles would be 150 megohms.

The following notes on insulation given in the Institution of Electrical Engineers' Wiring Rules will be found useful. Insulated conductors may be broadly classed under two heads:—(A) Those insulated with a material, as a dielectric, which is itself so impervious to moisture that it only needs further protection from mechanical injury or from vermin. (B) Those insulated with a material, as a dielectric, which, in order to preserve its insulation qualities, must be kept perfectly dry, and, therefore, needs to be incased in a waterproof tube or envelope, generally of soft material, such as lead, which is drawn closely over the dielectric.

When class A is used, the dielectric must be perfectly damp-proof, and not in any case less in thickness, measured radially, than 30 mils plus one-tenth of the diameter of the conductor; it should not soften at a lower temperature than 170° Fahr. The minimum insulation of a test piece cut from it should be:—

1,200 megohms per mile for conductors between 18 and 16 S.W.G.

800 megohms per mile for conductors between 16 and 14 S.W.G.

600 megohms per mile for conductors between 3/18 and 19/18 S.W.G.

400 megohms per mile for conductors between 7/14 and 39/16 S.W.G.

300 megohms per mile for conductors between 19/12 and 19/11 S.W.G.

the test being made at 60° Fahr., after one minute's electrification, and after the test piece has been immersed in water for 24 hours.

When class B is used, the same conditions as to minimum thickness and softening temperature of the dielectric should be enforced, as in class A; its covering should be such that a test piece cut from the conductor and immersed in water will not break down with an alternating pressure of 2,500 volts, having a frequency of from 40 to 100 periods per second, applied for ten minutes between the conductor and the water, the test piece previous to immersion being bent six times (three times in one direction and three times in the opposite direction) round a smooth cylindrical surface not more than twelve times the diameter of the conductor measured outside the dielectric.

The coil from which the test-piece was cut should be tested in a similar manner to class A; but the minimum insulation resistance should be 300 megohms per mile for all sizes of conductors. Conductors of class A must be protected from mechanical injury, by being covered with stout braid or taping, prepared so as to resist moisture, and must be further protected by casing, or by being drawn into pipes or conduits. In the case of conductors insulated as in class B, great care must be taken to protect exposed ends of conductors where they enter the terminals of switches, fuses, and other appliances, from the possible access of moisture which creeps along the insulating material within the waterproof covering.

To make these insulation tests, a long and known length of the cable is taken and formed into a coil, which is then placed in a tank containing water at 65° Fahr. for at least 24 hours, with the ends free. The outer covering of the free ends should be removed for 8in. or 9in., and the core should be thoroughly cleaned with wood naphtha and dried in the flame of a spirit-lamp. Connection should then be made with the testing-set and generator (previously described), and the insulation resistance taken exactly after one minute's electrification, as mentioned above. It is also advisable to apply the electrical pressure for a considerable time, in order to stress the dielectric to such an extent as to break down weak parts of the insulation, and to detect any latent flaw which may exist. In this way the quality of the insulation may be determined. Not only should the insulating covering be of good quality, but every joint should be well insulated. When we remember that every joint and connection presents an opportunity for leakage, it is evident that the production of a high insulation resistance of a circuit depends as much upon the number of joints, switches, fuse-blocks, and other fittings as upon the dielectric, since these sources of leakage are all in-parallel with one another. The effect upon the insulation resistance of a circuit of introducing fittings and making connections in a system of conductors will be seen by considering the following example:—A circuit consists of 1,000 yards of cable, having an insulation resistance of 2,000 megohms per mile, and there are 200 fittings, having an insulation resistance of 750 meghoms each; in addition to which there are ten joints in the circuit, each of 12,000 megohms resistance. Determine the insulation resistance of the circuit.

$$\text{Insulation resistance of cable} = \frac{1{,}760}{1{,}000} \times 2{,}000 = 3{,}520 \text{ megohms.}$$

$$\text{Insulation resistance of fittings} = \frac{1}{200} \times 750 = 3{\cdot}75 \text{ megohms.}$$

$$\text{Insulation resistance of joints} = \frac{1}{10} \times 12{,}000 = 1{,}200 \text{ megohms.}$$

And these are in parallel with each other, so that

$$\frac{1}{R} = \frac{1}{r_c} + \frac{1}{r_f} + \frac{1}{r_j}.$$

$$\therefore\ R = \frac{1}{\frac{1}{r_c} + \frac{1}{r_f} + \frac{1}{r_j}}$$

$$= \frac{1}{\frac{1}{3{,}520} + \frac{1}{3{\cdot}75} + \frac{1}{1{,}200}}$$

$$= \frac{1}{\cdot 000284 + \cdot 266 + \cdot 00083} = 3{\cdot}6 \text{ meghoms.}$$

It is, therefore, obvious that the installation comprising the conductors, fittings, and appliances should be thoroughly tested before current is switched on. The ohmmeter and generator (see Article XX.) enable the insulation resistance of a complete installation to be determined very

readily, and as we have already explained how to use this testing set—in the last article—it will only be necessary to add the following note:—"The whole of the lamps or appliances for utilising the energy having been connected to the conductors, and all fuses being in place, an E.M.F. equal to twice the E.M.F. which will be ordinarily used is to be applied (many generators give 200 volts), and the insulation resistance between the whole system and earth must be measured after one minute's electrification. The insulation should then not be less than 10 meghoms, divided by the maximum number of

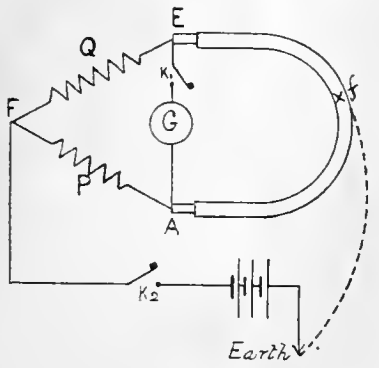


Fig. 71.

ampères required for the lamps and other appliances. The installation may then be set to work, and a second and similar test should be made after an interval of fifteen days. In each test, if the insulation of the whole is below standard, the work should be divided up by the departmental switches and tested separately, in order to locate the faulty section. The value of systematically testing and inspecting apparatus and circuits cannot be too strongly urged as a precaution against fire. Records should be kept of all tests, so that any gradual deterioration of the system may be detected. Cleanliness of all parts of the apparatus and fittings is essential. No repairs or alterations should be made when the current is *on*."

It may also be mentioned here that if the current is to be taken from a supply company's mains, the inspector of the company will make a separate test before connection is made with the mains.

Localisation of Faults.—Should a fault exist in a cable, it should be removed at once. Of the several methods of localising the fault in a cable the simplest and most convenient is that known as Murray's Loop Test, especially when both ends of the faulty cable are accessible, or when the far ends of the lead and return may be conveniently united. In this method a *loop* is formed with the main containing the fault, as the cable must form part of the complete circuit from and to the testing station. To do this, the positive and negative mains must be connected together at any convenient point beyond the fault, so that

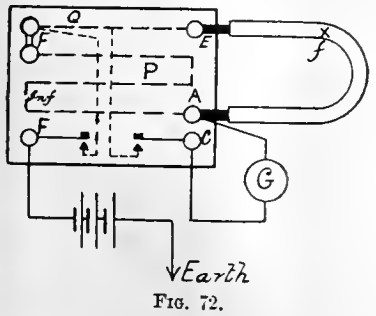

Fig. 72.

the lead and return form a single circuit. In Fig. 71 let E*f*A represent such a loop in which there is a fault at *f*, so that E*f* and *f*A are the segments into which the fault divides the loop, and it is evident that by connecting the loop with two resistance coils, Q and P, and a sensitive galvanometer, G, as shown (a battery being connected to the common junction of the two resistance coils and to earth), we have an arrangement of conductors corresponding to the Wheatstone's Bridge arrangement, described in Article XX. The dotted line connecting the fault *f* with the earth connection is introduced to show that the arrangement is a typical Wheatstone's Bridge.

A moment's consideration will suffice to prove that if the resistances P and Q are adjusted so as to produce equilibrium, the following relation holds:—

$$P \times fE = Q \times Af, \text{ or } \frac{P}{Q} = \frac{Af}{fE}$$

where Af and fE denote the resistances of A*f* and *f*E respectively. And by adding one to each side of the equation we obtain—

$$\frac{Af}{fE} + 1 = \frac{P}{Q} + 1$$

or—

$$\frac{Af + fE}{fE} = \frac{P + Q}{Q}$$

Now, let x = length E*f* or distance of the fault from E, and l = the total length of the loop E*f*A. Then—

$$\frac{Af + fE}{fE} = \frac{l}{x} = \frac{P + Q}{Q}$$

and—

$$x = \frac{Q}{P + Q} \times l.$$

$$= \frac{Q}{P + Q} \times \text{total length of the loop A}f\text{E}.$$

From these results it is obvious that both the post-office bridge and the mètre bridge may be conveniently used for making the test, and the connections for the former are given in Fig. 72, in which the same letters are used as in the previous figure, and it will be observed that the battery and galvanometer have replaced each other as compared with their positions in the ordinary resistance test (given in Fig. 68). The method of making the test is as follows:—Unplug 1,000 ohms from the ratio arms Q, and close the battery key K_1. By closing the galvanometer key K_2 for an instant, a deflection is obtained

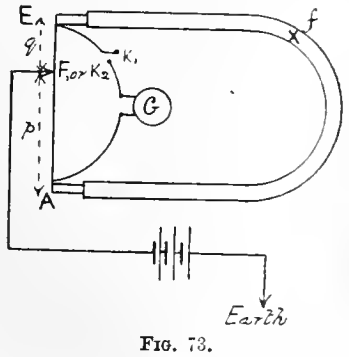

Fig. 73.

which indicates the direction of the deflection when *more* resistance must be added, when making the test, in the rheostat arm P. Having determined this, the resistance of P is adjusted until no current passes through the galvanometer when the two keys K_1 and K_2 are both depressed. If the deflection, however, indicates *too little* when all the resistances in the rheostat arm P are unplugged, one of two possible causes may account for the inability of getting no zero deflection—(1) the connections may be wrong, and (2) the position of the fault *f* may be too near E, for the ratio of Q to P used—i.e., when Q = 1,000 ohms and P = 11,110 ohms.

If the connections are correct, then a deflection indicating *too much* will be obtained on removing the infinity plug in the arm P, the keys K_1 and K_2 both being depressed, Q still being 1,000 ohms. Having decided this point, try 100 ohms for Q instead of 1,000 ohms, and again adjust the resistance of P until zero deflection is obtained. If Q = 100 ohms be too great, try Q = 10 ohms, and if the test then fails it is certain that the fault *f* is very near to E. In such a case the ends of the loop of the cable should be reversed—i.e., are connected to the box in the opposite way, and Q = 1,000 or 1,110 ohms is tried, and the position of the fault determined. If x is the distance of the fault from E, then in all cases—

$$x = \frac{Q}{P + Q} \times l.$$

To understand the connections when the Mètre Bridge pattern of the Wheatstone's Bridge is used for making the test, it is only necessary to imagine that the two resistance coils P and Q of Fig. 71, form the stretched wire of the bridge, and that the end of the battery wire at F is the slider K_1, and we obtain the arrangement shown in Fig. 73, E being the zero end of the scale. By adjusting the position of the slider K_1, a position may be found so that the ratio of the segments into which the mètre-wire is divided is the same as the ratio of the segments E*f* and *f*A of the cable loop; then, if q and p are the lengths of the wire as shown in the figure—

$$x = \frac{q}{q + p} \times l = \frac{q\,l}{100}$$

as before, when no deflection of the galvanometer needle is obtained on depressing both keys K_1 and K_2.

As may be supposed, the *leads* connecting the

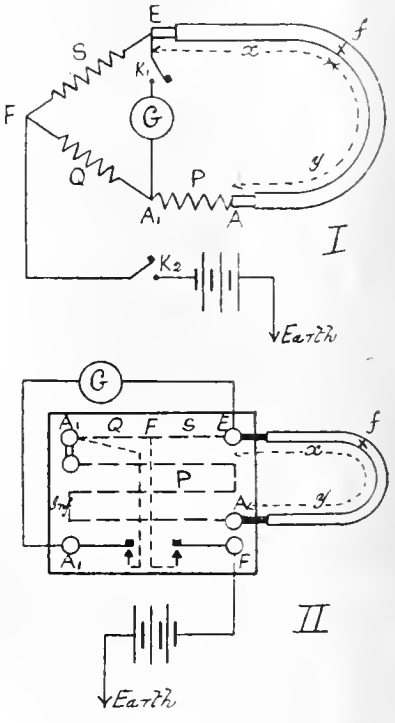

Fig. 74.

ends of the faulty cable (forming the loop) to the terminals E and A are often of a different cross-sectional area to that of the cable, and in making the calculation for determining the position of the fault, the equivalent length of the leads must be taken into account as being part of l, the total length of the loop. In all cases the leads should be as short as possible. By equivalent length is meant a length of the cable having the same resistance as the leads. It may also be mentioned that the size of the battery—*i.e.*, number of cells in series—depends upon the nature of the fault, a large battery being required if the fault is of high resistance. In some cases several Leclanché cells are sufficient.

As an alternative test for determining the position of a fault, we may mention *Varley's Loop Test*, which is a simple modification of the preceding method. It, however, can only be used in conjuction with the Post-Office box, and the difference between the two tests consists in introducing an adjustable resistance at one end of the loop. The connections are shown in Figs. 74 I. and II., the added resistance being connected between A and A'. The ratio of the resistances Q and S of the ratio arms is maintained constant, useful values in practice being Q = 1,000 and S = 10 ohms; and P is adjusted until equilibrium is attained. It, however, is important that the battery key K_2 should be depressed before the galvanometer key K_1 in closing the circuit. On breaking the circuit K_1 is opened before K_2. The fault is at *f*, as before, and if the resistance R of the cable E *f* A be not accurately known, it must be determined by the ordinary method.

When equilibrium is attained, we have the following relations:—

$$S : Q :: x : (r - P)$$

$$x = R - y.$$

And since—

$$S(y + P) = Qx$$

$$= Q(R - y)$$

$$\therefore\ y(S + Q) = QR - SP$$

and—

$$y = \frac{QR - SP}{S + Q}$$

If Q were taken equal to S, this result would reduce to—

$$y = \frac{R - P}{2}$$

but the result is not so accurate as when Q is large compared with S. It will, of course, be observed that y is the resistance of the segment connected to A. Let l again denote the length of the loop $E f A$, and Y the distance of the fault from A, then evidently—

$$\frac{y}{R} = \frac{Y}{l} \quad \text{and} \quad Y = \frac{l}{R} \cdot y,$$

therefore, the distance of the fault from A is given by the equation—

$$Y = \frac{l\,(Q\,R - S\,P)}{R\,(S + Q)}$$

(To be continued.)

SANITARY WORK.—V.

CLEARING DRAINS.

ONE of the commonest experiences of those who are in any way concerned with the maintenance of drains from a number of houses or other occupied buildings is the unwelcome intimation that a drain, gully, sink, or other sanitary fitment is choked, and must, therefore, receive immediate attention.

Before discussing the actual details connected with the operation of clearing drains and their connections, it is desirable to notice the varied causes which may lead to these appurtenances becoming ultimately blocked. In all cases where—from ignorance or motives of false economy—the drains are improperly constructed in the first instance, stoppages must be expected as a natural consequence, even though the sanitary fittings be subjected only to proper and legitimate treatment.

By far the greater number of obstructions are, however, the direct result of improper or careless usage. This is more particularly observed in connection with the drainage arrangements for houses of the poorer class, large factories, workshops, schools, public institutions, &c. Judging from results, it would appear that very many persons are strongly imbued with the idea that drains and their accessories are designed to receive and remove rubbish of every conceivable description. Provided the article can in any way be forced into the drain sufficiently far to be out of sight, it is apparently presumed that the drain will afterwards digest or otherwise remove the substance without any further attention.

Sometimes the stoppages are entirely caused by evilly-disposed persons passing articles into the drains, so as to dispose of them without indicating the source from which they originated. To deposit articles of this description in the domestic ash-bin in the usual way might possibly lead to inquiries, if not to ultimate detection, and for this reason the drains are frequently selected as a convenient transporting medium.

Considering the almost endless variety of foreign substances which are wilfully or thoughtlessly passed into the closets, sinks, and other sanitary appliances, the wonder is not so much that the drains eventually become choked, but that under such unfair and constantly recurring conditions they fulfil their purpose so efficiently as they are usually found to do in actual practice.

Amongst the numerous articles which are found in clearing operations, and which must have been intentionally passed into the drains, may be mentioned old tins, bottles, worn-out boots and shoes, disused wearing apparel, &c. On the other hand, the entry of large pieces of soap, scrubbing brushes, pumice-stone, bath bricks, table knives, spoons, &c., generally result from carelessness. Under ordinary circumstances, the passage of the latter class of articles into the drains is prevented by the gratings or guards fixed to the sinks and gullies.

Where the drainage arrangements are properly constructed and maintained in efficient working order by a periodical examination, testing, and subsequent remedying of all defects due to ordinary wear and tear, it may be safely assumed that with fair usage such an incident as a stoppage will be a very rare occurrence. As a general rule, it may therefore be assumed that stoppages result almost entirely from preventible causes, such as defective construction, unfair usage, or carelessness.

When the obstruction has been removed and the drain restored to its normal condition, a careful examination should at the same time be made, in order to definitely determine the contributory cause of the stoppage. Should this be traced to any defective material or workmanship in the drain or fittings, it is desirable that the necessary alterations be made before finally leaving the work. If the stoppage has occurred

Fig. 37.

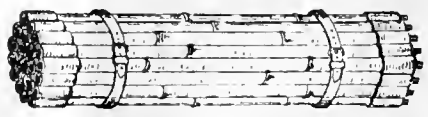

Fig. 38.

Fig. 40.

by reason of careless or improper usage, then the occupants should be cautioned against the repetition of such misuse, so that a recurrence of the stoppage may as far as possible be prevented.

In all drain-clearing operations the principal object to be attained is the speedy removal of the obstruction without disturbing or interfering with the general construction of the drains or sanitary appliances. Only as a last resource should the drains be broken into, as it is not only expensive but difficult to make good the disturbed work in such a way that the internal portion of the joints of the new pipes shall be clean and axially true, and the whole of the repair left sound and watertight.

Figs. 37 to 45 are sketches showing a set of drain-clearing rods together with the various accessories used in connection therewith. The drain-rods consist of stout brown malacca canes, mounted with brass male and female screw connections, so that the whole may be readily put together for use. The brass mountings must be securely riveted through the canes, the screw-threads being accurately finished so that the rods may be interchangeable throughout. A set of drain-rods when screwed together is usually about 100ft. in length. It is not desirable to use drain-rods exceeding a length of 100ft. to 120ft., as longer lengths are apt to become unmanageable, more especially when working in confined positions. For convenience of transport the rods are secured in a bundle by two leather straps, as shown in the illustration (Fig. 37). Iron drain-rods put together with a simple form of joint are also sometimes used.

Fig. 38 is the sketch of a "spring-hook" used for dislodging and breaking up accumulations of solid matter in the drains. The "double worm-screw" shown in Fig. 39 is more particularly designed for removing rags, paper, and other similar impedimenta.

Figs. 40 and 41 are illustrations of the ordinary "clearing wheel" and "universal roller." The latter instrument is arranged with a swivel joint,

Fig. 39.

Fig. 41.

Fig. 42.

Fig. 43.

so as to allow the rollers to glide easily over the joints or round the bends of the drain-pipes. Sketches of a "plain" and "jointed scraper" respectively are indicated in Figs. 42 and 43. Their general outline sufficiently explains their use. What is known as a "drain-brush" is shown in Fig. 44. They are usually made of bass fibre or whalebone. Drain-brushes form a useful adjunct for sweeping and cleansing purposes, and may be obtained from 4in. to 24in. in diameter.

Fig. 45 is an illustration of a "solid plunger." The disc is made of stout leather or indiarubber, and of sizes generally varying from 4in. to 8in. in diameter. Should it be necessary to pass the drain-clearing apparatus beyond a very sharp curve or bend, the drain-rods already described are insufficiently pliant to effect this object. Under such circumstances, a special description of

Fig. 44.

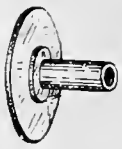

Fig. 45.

rod, known as "flexible-cane rods," may be utilised with advantage. These rods are made up of a number of thin canes twisted together (see Fig. 46), in order to provide the requisite flexibility together with sufficient stiffness for the purpose.

A well-designed drainage system must be so arranged that every portion is accessible, either directly or by means of drain-rods. For this purpose, inspection chambers should be constructed at the junction of two or more drains, and also at any bend or change of direction. The inspection chambers or manholes should preferably be placed not more than 200ft. apart.

Where such precautions are adopted it becomes a very simple matter to inspect and cleanse the drains at all times, and thus remove any obstruction that may take place without disturbing or interfering with the pipes and fittings.

In the case of old drains which have been laid without providing the necessary means of access to the different portions of the system, it is oftentimes a matter of the greatest difficulty to remove

Fig. 46.

a stoppage, except by opening the ground, and breaking into the drain at one or more points.

Should it not be practicable to use drain-rods, the obstruction may sometimes be reached and dislodged without otherwise disturbing the existing work by inserting a long thin iron rod at an adjacent gully or other convenient opening. Another method which is frequently adopted is to try and break up or force the obstruction through the drain by means of an indiarubber or leather plunger (Fig. 47) worked vigorously at the opening nearest the stoppage. In many instances, however, instead of removing the obstruction, the result is to compress it more tightly into its position, so that it finally becomes necessary to remove the substance by digging down to and opening the drain.

When circumstances necessitate the breaking

Fig. 47.

into a drain for clearing purposes, it is advisable to arrange for the construction of a manhole at this point (if means of access is otherwise deficient) instead of merely making good the drain in the ordinary manner. More especially should this precaution be taken when—as is frequently the case—the obstruction occurs at a junction or bend in the drains.

Whilst stoppages in drains and fittings may

not be absolutely and entirely avoidable, particularly where they are subject to rough usage, as in public institutions, &c., yet much can be done towards practically attaining this end by a method of periodical inspection and cleansing.

It is interesting to note that the London School Board have recently introduced a system whereby each school is visited in rotation, and the entire sanitary arrangements of the building thoroughly overhauled and cleansed by a staff of men specially appointed for the purpose. Any defects which may be observed are also taken in hand and remedied at the same time. In many instances the nucleus of what would have quickly resulted in a serious stoppage has been easily removed at a minimum of expense compared with the probable cost and serious inconvenience involved in clearing a drain which has become completely choked.

Similar schemes for the systematic inspection and cleansing of the draining systems appertaining to other important groups of buildings might be advantageously adopted by various public bodies. Such a practice would undoubtedly materially assist in maintaining a proper degree of permanent sanitary efficiency.

SYSTEMS OF STEAM-HEATING BUILDINGS.

So many systems of heating divide the attention of the architect that he often disposes altogether of the matter, and places the heating of his buildings into the hands of competent engineers, who do not always adopt the most desirable system, but that which they have an interest in—it may be some special patented system, excellent in certain situations and for certain kinds of building, but not the best adapted for the particular purpose. Mr. J. J. Blackmore, in the *Engineering Magazine*, describes three kinds of steam-heating which have been developed—the "gravity system," in which the steam generated in the boiler rises to the radiators, and being condensed, the water is returned to the boiler by gravitation through a return pipe. The second system is called the "mechanical," because mechanical means are employed to reduce "the pressure of steam on the system from that carried in the boiler, and mechanical appliances are used to return the water of condensation from the return pipes back to boiler. These may be in the shape of an automatic steam trap or a pump and governor." The third is the "exhaust steam system," in which "the heating is done by steam that has been used to drive engines or pumps. Mechanical appliances are also used for controlling and directing the steam through the system." Of these systems the first is that which obtains most favour. It has the advantage of being a low-pressure system, is quite safe, and if properly constructed will work well on ordinary buildings without indicating any pressure on the steam-gauge, the atmospheric pressure being able to distribute the steam to the radiators. Mr. Blackmore prefers the vertical type of cast-iron boiler to the horizontal. In the former separate sections are bolted together, each resting on the foundation; in the latter the sections are set one on another. Therefore, it is easier to enlarge the "vertical" type by adding sections, and the grate area is enlarged at the same time. The joints are exposed to view, and the boiler can be put together without the aid of packed joints, and the vertical form promotes a quicker circulation. The horizontal boiler cannot be so easily enlarged or cleaned; the joints are packed, and they need more frequent repair. Steel and wrought-iron tubular boilers are also used; the large steam space makes the apparatus work more uniformly and economically than the cast-iron sectional boilers, especially for larger boilers.

The single-pipe system of distribution is admirable for ordinary heating by radiators: the water of condensation is carried in the direction in which the steam flows, and is returned to boiler with little loss of heat. One plan of distribution by this method shows the horizontal pipes dropping towards the bottom of the rising pipes, and relief pipes carry the water back to boiler. Another and better plan is to run a main feed-pipe to top of building, and the branch pipes are carried to the radiators. Pipes are dropped to feed the radiators in the floors below, and in the cellar return-pipes return the water to the boiler. If properly executed, this last method has advantages: the steam is carried through the whole system in the direction of the water-flow. Mr. Blackmore formulates a simple rule for the proper size of steam-pipe, the rules given in text-books varying considerably, the results, according to four writers, varying as much as 130 per cent. Many useful hints and suggestions are made by the author of the article, into which we cannot enter. Of course, there are well-known rules which ought to be strictly observed: as that all the horizontal pipes should have a regular fall in the direction the steam flows—say 1in. in 10ft. The startling cracking noises heard are due to the condensed water remaining in the pipes. We still think that a flow-and-return pipe is necessary to each radiator; but the author says it is not necessary, as water will return down a rising pipe while steam is flowing up, clinging to the surface of the pipe. The question of radiators direct and indirect is discussed, and of these there are several good ones in the market. The indirect radiator placed in a chamber under the room has decided advantages; but this is a point into which we cannot enter here.

COMPARATIVE STRENGTH OF RIVETED AND BOLTED JOINTS.

Some important tests have, says the *American Architect*, been made at the Watertown Arsenal during the past year to ascertain the comparative strength of riveted and bolted joints. The tests were caaried out at the request of the Berlin Iron Bridge Company, which prepared the material for the trial. A great variety of tests were made with joints riveted in different ways, and with different dimensions of plates and bolts, some which represent those most commonly met with in building work. In most of the tests the joints were made with the rivets or bolts in short rows, as is usually the case in building, and they were sometimes steel and sometimes iron. The steel was naturally stronger in each case. Two plates, ½in. thick, joined with two ¾in. rivets or bolts, held 48,510lb. with riveted joint, and 37,690lb. with bolts; with three rivets, in a single row, the joint parted at 79,960lb., and with bolts, similarly disposed, at 58,120lb. With four rivets, in a single row, the joint held 100,000lb., and, with four bolts, 76,900lb. Two ½in. plates, joined with ⅝in. rivets or bolts, held, with ten rivets, 169,700lb.; with bolts, 105,200lb.; with eight rivets, 138,800lb.; with eight bolts, 87,100lb.; with six rivets, 105,900lb., and with six bolts 66,700lb. With ½in. plates, riveted in two rows, a joint with ten rivets held 157,400lb., and with bolts only 84,000; with eight rivets, 127,100lb.; with bolts, 81,800lb.; with six rivets, 96,000lb., and with bolts 51,800lb. These tests were made with ⅝in. bolts or rivets, so that an increase in the diameter of a bolt appears to have an important influence in bringing its efficiency nearer to that of a rivet. Three-quarter-inch plates, joined with two ⅞in. rivets, held 89,800lb.; with bolts, 59,900lb.; with three rivets, 139,300lb.; with bolts, 112,800lb.; and with four rivets, 175,400lb.; with bolt 140,100lb. The same plates, joined with twelve ⅝in. rivets, in a chain, gave way at 169,900lb., and with bolts at 113,109lb. These results seem to indicate clearly that the average strength of a bolted joint is only about two-thirds that of a riveted joint of the same sort, and that, if the diameter of the bolts or rivets is rather small in comparison with the thickness of the plates, the strength of the bolted joint may not be much more than one-half that of a riveted joint. It is therefore advisable, in designing bolted joints, to provide at least one-half more bolts than the number of rivets given by the ordinary rules for riveted joints. A lofty structure, attached to the ground only at its foot, and affording little opportunity for diagonal wind-bracing, is peculiarly liable to injury through lack of rigidity at the joints; and if bolts—which never hold the parts together as firmly as rivets—are to be used in the joints, an additional allowance should be made to their number, as a protection against the effect of momentum due to swaying.

DISCOVERIES OF BUDDHIST REMAINS IN INDIA.

Mr. Vincent Smith, of the Bengal Civil Service, has published a statement as to the recent discoveries of Buddhist antiquities in India. The first of these is the home of Gautama Buddha, who lived about 500 B.C., and who is known to have been the son of the Raja of Kapilavastu, a small State in the Nepal Terai, bordering on the modern Oudh. The site of Kapilavastu has long been sought for, and it is only within the past three years that the accidental discovery of an inscribed pillar erected by the Emperor Asoka, in the third century B.C., fixed with certainty the site of the city. The ruins, which were lately visited by Mr. Smith, are, so far as is yet known, all of brick; they are buried in jungle, and are so extensive that many years would be required for their exploration. The city was destroyed during the lifetime of Gautama, and when the first Chinese pilgrims visited the place in 410 A.D. it was a mass of desolate ruins, and there is no indication that it has since been occupied. The excavations now in progress are bringing to light buildings more ancient than any previously known in India. More interesting even than Kapilavastu is the discovery of the Lumbini Garden, the traditional birthplace of Gautama. The sacred spot has been found marked by another of Asoka's pillars, on which the inscription is perfect. This is also in Nepalese territory, five miles from the British frontier. The pillar stands on the western edge of a mound of ruins about 300ft. in diameter, and on the south side of the mound is the tank in which the child's mother bathed after his birth. Another discovery, which was made in a brick tumulus, close to the British frontier, is that of relics of Buddha himself. These consist only of fragments of bone, which were deposited in a wooden vessel that stood on the bottom of a massive coffer more than 4ft. long and 2ft. deep, cut out of a solid block of fine sandstone. This coffer was buried under 18ft. of masonry, composed of huge bricks, each 16in. long. The wooden vessel was decayed, and with it was a bowl of rock crystal, the largest yet discovered in India, and also five small vases of soapstone. All these vessels were partially filled, in honour of the relics, with a marvellous collection of gold stars, pearls, topazes, beryls, and other jewels, and of various objects wrought in crystal, agate, and other substances. An inscription on the lid of one of the soapstone vases declares the relics to be those of Buddha himself, and the characters in which this inscription is written are substantially the same as those of the Asoka inscriptions, and indicate that the tumulus was constructed between 300 and 250 B.C. Buddha spent many years preaching and teaching at the the city of Sravasti. The site of this famous city was long sought in vain. Mr. Smith now states that it is in the jungles of the Nepal Terai, about 11 miles from the station of Nepalganj-road on the Bengal and North-Western Railway. Its remains, like those of Kapilavastu, are buried in jungle; but they seem of great extent, and are found precisely where the Chinese pilgrims of the early centuries of the Christian era stated that Sravasti was. Kusanagara, where the aged Gautama died, has not yet been found; but Mr. Smith suggests that it is not very far from the massive ruins of Simranu, north of the Champaran district of Nepal, and thinks that a place called Dewdurpa, 13 miles north of Simranu and 54 miles south of Kathmandu, will turn out to be Kusanagara.

ST. MARY'S CATHEDRAL, EDINBURGH.

The south choir aisle, which has been formed into a separate chapel, is divided by wrought-iron grilles from the choir, and has now been further inclosed by an elaborate wrought-iron grille and gates at the diagonal arch entering off the south transept, and at the eastmost bay by a curtain of crimson silk attached to a wrought-iron frieze which is a continuation of the wrought-iron work dividing the choir from the chapel. An altar of "jaune jaspé" marble with a reredos of "rouge jaspé" has been erected about 18in. in front of the east end of the aisle. The altar and reredos, which are of Romanesque design, are raised on three steps of marble. Two of these steps rise from a platform of red marble mosaic, bordered by a marble step 6in. above the stone floor. All the steps are of *campan mélangé*. The altar is panelled on front and sides, and has a moulded base and a moulded and enriched cornice. The centre panel contains an enriched cross. The moulded cornice of the reredos rises 1ft. 9in. above the altar table, and extends beyond it about 1ft. on each side. The reredos is flanked by octagonal shafts having massive richly moulded bases and carved capitals, also by panelled pilasters projecting from its face. Over the centre of the reredos rises an enriched panel containing the letters I.H.S. On the

cornice of this rests a lofty massive bronze cross very elaborately chased in Romanesque detail, and on small marble blocks projecting above the cornice, over the pilasters, are massive bronze candlesticks, quaint in form, and enriched with elaborate ornament, similar to that on the cross. Both cross and candlesticks are fine examples of artistic work in metal. Two bronze flower-vases of unique form are placed between the cross and the candlesticks. The altar-rail is of polished walnut, supported on finely-modelled bronze standards. The altar and reredos are built solid, and, the marble being rich in colour, make a very effective grouping with the stained-glass windows beneath which they are placed. A double piscina of polished free-stone has been inserted in the south wall. The chapel is seated with chairs, and provided with substantial mats and suitable kneeling hassocks. The electric light has been introduced with groups of lamps above the capitals of the pillars. The work, which has been seven months in progress, has been carried out at the expense of a member of the congregation, from designs by Mr. George Henderson, of Messrs. Hay and Henderson, architects. The marble-work has been executed by Messrs. Field and Allan, the metal-work by Messrs. Singer and Sons, Frome; and the hangings are by Messrs. Whytock, Reid, and Company. We understand that the chapel will in future be used for the daily celebration of the Holy Communion, for matins on Saturdays, and for the various minor services.

THE WORKING VALUE OF FUELS.

By Thos. Fletcher, F.C.S.

In some experiments carried on at the New York State Veterinary College, it was found that the heat lost by ventilation was 39° of the whole, and my attention has been called to the fact that these figures, which may be taken as correct, differ seriously from those given in my book on the "Commercial Uses of Coal-Gas," where the amount lost in Messrs. Walkers' bottling stores is given as varying from 22½° to 25°. The explanation is simple: the minimum ventilation required in living-rooms is 500c.ft. of air per hour for each adult. In bottling stores, only a fraction of this is required—in fact, no provision whatever is made for ventilation, and all which takes place occurs from leakages, and the constant opening of doors for the passage of trucks and barrels. The figures given by me are clearly stated as being observed results in practice in bottling stores only. I had no opportunity, before the book was published, of making exact experiments in living-rooms, these being very difficult, if not impossible, under ordinary conditions, in any house, the speed of the air currents in the flues varying almost from minute to minute. Recent experiments in rooms where the ventilation is controlled and can be measured have established a rule, which may be safely relied on for every practical purpose. The accepted standard is the British thermal unit—*i.e.*, the amount of heat necessary to raise the temperature of 1lb. of water 1 Fahrenheit, and one unit is required per hour for each degree rise of temperature over the outside for each square foot of glass or for every 4sq.ft. of exposed wall, and two-thirds more for the loss of heat by ventilation in ordinary living-rooms. The loss of heat in living-rooms is an unknown quantity, as it varies in every room, and in the same room from hour to hour; but, taking the theoretical value of coal-gas at 660 British thermal units per cubic foot, that of coal 13,000 units per pound, and of coke 10,000 units per pound, it becomes easy to calculate the effective value and the loss of heat in different systems. A flueless gas-stove may be taken as the highest type of efficiency, and using this, 1c.ft. of gas per hour will be required for every 660sq.ft. of glass, or every 2,680sq.ft. of exposed wall, for every 1° rise of temperature over the outside, and in addition to this, two-thirds of a cubic foot for loss by ventilation. Taking a room 22ft. square and 10ft. high, with all walls exposed, 2c.ft. of gas per hour will maintain a rise of 3° over the outside, allowing for the average window surface. The exact figures for warm-air stoves with flues, and for open fires, are not available, and perhaps not possible; but for average practice it may be taken that nearly one-half the total heat is lost in a warm air stove with a flue, and two-thirds with an open fire. This can hardly be considered as all loss, as the ventilation necessary for comfort and health cannot be always obtained without some assistance, and the so-called loss may be partly taken as useful work done. The whole subject is beset with variations and difficulties, and any standard can be proved to be seriously wrong in individual cases; but the figures given may be taken for average work. It must be clearly understood that the figures given are for maintaining the heat, not for raising the temperature of any room quickly, for which a much larger fuel consumption is required.

HEATING PLANT HOUSES.

These figures work out in practice in greenhouse heating, where steady temperatures are required night and day, and the loss from any system of boiler or stoves can be readily calculated, a matter of interest to nurserymen whose fuel consumption is a question of vital importance. The loss in most forms of boilers is enormous, and the subject needs careful consideration. For this purpose the calculation is exceedingly simple, on the basis of 10,000 units per pound of coke. One pound of coke burnt per hour will give a rise of 10° for every 1,000sq.ft. of glass, or 4,000sq.ft. of exposed wall, not allowing for loss by ventilation. For this, one-half more fuel must be allowed. This gives us the maximum possible duty, and a comparison with the fuel burnt gives the waste. Where the flue heat is not utilised, there is no doubt that at least 50 to 60 per cent. of the fuel is completely wasted in most of the systems at present in use, and the value of the fuel is not considered as it should be. In my own case, with a Chatsworth boiler, burning gas coke, and heating a range of houses 45ft. by 30ft., one-half which is kept at a tropical temperature, the flue-heat not being used, the calculated consumption is 8lb. per hour by theory, allowing one-eighth loss for wind, as the houses are on high ground and rather exposed (this wind allowance will vary in different districts). The actual winter average is 11½lb. per hour, showing a waste of 31½ p.c., nearly one-third of the fuel—this being with a first-class boiler, clean, well set, carefully fired, and of the correct size for its work. It is doubtful if better results could be obtained in practice under ordinary conditions.

The following rule may be taken as a guide for coke-fired greenhouse boilers:—

For every 1,000sq.ft. of glass, and for every 4,000sq.ft. of exposed wall, for each 10° rise of temperature over the outside—

Loss through glass and walls	16oz.	per hour.
,, by ventilation	8oz.	,, ,,
,, by wind (average)	3oz.	,, ,,
,, by boiler and flue	13oz.	,, ,,
Total	2¾lb.	

Three-fourths of the flue loss can be recovered by taking these under the beds in the houses. Any fuel consumption over this may be taken as waste which can be prevented.

REPLACING FRONTS.

In the United States the removal of whole fronts of buildings is often effected. One of these is recorded. The least possible obstruction to the street or interference with the occupants of the interior was necessary. Mr. H. Sheeler, of Chicago, removed the front wall of the sixth story of a nine-story steel building, and built in a new front with projecting bay windows without disturbing the inmates. Some hundreds of tons above the sixth story had to be supported. It had to be lifted from its original supports and temporarily sustained high in the air for many days, and then seated on new work. No scaffolding or false work from the ground could be attempted, or to introduce shores. Messrs. Grace and Hyde, architects, designed the new ironwork, consisting of 250 tons of columns, beams, and other structural steel, besides the wall masonry, &c., forming the new front of a section of the wall about 80ft. long by 12ft. high across the centre front of the building. The twelve windows of the fifth story were separated by piers. The first step, as described, was "to cut down the wall under the window-sills to the fifth-floor level between all the piers, and then to lay a pair of 10in. I beams 8ft. long in the floor close to each side of each pier, and at right angles to front wall, so that they all projected 2ft. beyond face, and formed cantilevers with bearings on the surface of the wooden floor. Twenty-four pairs of beams were thus laid, and upon them were set two continuous sills parallel to wall, one 18in. outside of it and the other 3ft. inside. Over each side of each cantilever a 6-ton jack screw, and 8in. by 8in. timber post were set on the sill, these tops being cut to bear on the underside of an 8in. I beam which supported the wall, and took bearing on the under side of the 6in. floor beams." When the jack-screws were turned up to a solid bearing, the weight of the wall and the wall end of floor beams from the sixth floor upwards were taken and transmitted through the posts and jack-screws to the cantilevers on the fifth floor. While the superstructure was thus supported the old front was removed and the new one put in. The continuous stringers or sills distributed the pressure. The details are fully given in the *Engineering Record*.

STATION INDICATORS.

Thrown not merely into the shade, but into an obscurity so complete as to render them absolutely indistinguishable as are the names of our railway stations by the mass of advertisements closely surrounding them on all sides, an indicator in the trains themselves has become a practical necessity. If this is the case with the regular diurnal and nocturnal *habitués* of the gloomy depths of our Metropolitan Underground, how much more is it not needed by the foreigners and the stranger, and those who for the first time penetrate into those Stygian regions. For some time past, a person travelling in a first-class carriage on the Metropolitan or District line, after passing any station has heard—or perhaps did not hear—two strokes of a gong or bell, exactly similar to a signal, accompanied, or immediately followed, by a distinct whirr resembling that of a piece of clockwork. It is very possible that, although his destination may be several stations beyond that upon quitting which he first heard the signal, he may reach it before understanding what the meaning of the signal is, and no doubt regards it as one used in the working of the traffic. A careful *reconnaissance* of the interior of the whole carriage, made directly after the two strokes have sounded, will reveal the fact that a cylindrical glass and wooden box is attached to the central part of the ceiling of the carriage. In the box is placed a cylinder, which appears to act very much after the fashion in which that in a perpetual diary registers the days, weeks and months of the year. When the whirring noise ceases the internal cylinder has performed a revolution, or at least so much of a whole revolution as is required, the name of the last station has disappeared from its surface, and that of the next has taken its place. While there is no doubt that the situation up in the roof of the indicating apparatus is a little awkward, yet it is difficult to perceive where else it could be placed to any better advantage. The names of the stations on the cylinder are distinctly visible to everyone in the carriage, and, besides, its position and working renders it nearly altogether free from the chance of being meddled or tampered with.

While our English companies should be congratulated upon their enterprising spirit, our French neighbours have, it must be fairly conceded, "gone one better." But a short time ago the company of Parisian steamboats placed station indicators on their vessels navigating the Seine. Without entering into details, a brief description of the arrangement will not be without some interest. The indicator itself consists of a rectangular wooden box, 2ft. 9in. in height, 1ft. 4in. broad, and 5in. in thickness. In the upper part of the box is placed the clockwork motor, the working parts of which are hidden from view by a small board fixed over them, and carrying on its face the words "Next Station." Upon the signal being given after quitting a station, one of the name-plates, which are all arranged in a series, is detached from its companions, and falls forward. A little manipulation is needed, as, for instance, when the return voyage is commenced, and the plates require resetting. Again, it is sometimes required to take the series of plates completely out of the apparatus, and shift them on board another boat, according to the exigencies of the service. In each small river steamer there are three of these station indicators, one placed in a very conspicuous place on deck near the bridge, one in the forward cabin, and the third in that abaft. All three are perfectly simultaneous, insochronous, and constant in their action, being connected together by a tube

conductor. As frequently with ourselves, so with our neighbours. The difficulty is not so much to invent any particular apparatus or piece of machinery to do a certain work, but the real trouble is to get people to use them. In the very example in question it is no easy matter to make the skippers and crews of the boats use the indicators regularly, and not only when it pleases them to do so. T. C.

A ROYAL EGYPTIAN TOMB.

As a sequel to his discovery of the tomb of King Thothmes III. at Thebes, M. Loret, director-general of the Antiquities Department, has discovered and opened the tomb of Amenophis II., a king of the XVIII. dynasty, who reigned some 1,500 years B.C. Although the jewelry, &c., were rifled from the tomb probably during the XX. dynasty, the mummies of Amenophis and of seven other kings are intact. The tomb is entered, says Sir W. E. Garstin, by a steep inclined gallery, which terminates in a well of some 26ft. in depth, and, this obstacle surmounted, the entrance to the king's sepulchre is reached. In the first chamber the body of a man is found, bound on to a richly-painted boat, his arms and feet tied with cords, a piece of cloth stuffed as a gag into his mouth, and marks of wounds on the breast and head. In the next chamber are laid out the bodies of a man, a woman, and a boy. The king's tomb is in perfect preservation. The roof, which is supported by massive square columns, is painted blue, studded with stars, and the walls are entirely covered with paintings, the colours of which are still vivid. At one end of this chamber is the sarcophagus of the king, placed upon a massive block of alabaster. The sarcophagus is of sandstone, artificially coloured a rose hue, and contains the mummy intact, with chaplets of flowers round the feet and neck. In a smaller chamber to the right are nine mummies, two of them bearing no name, and the others those of the Kings Thothmes IV., Amenophis III., Set Nakht, Seti II., Rameses IV., Rameses VI., and Rameses VIII., who all reigned between about 1500 and 1150 B.C. The tomb is that of Amenophis II., for whom it was built, and is supposed to have been opened later to receive the mummies of the other kings. The floors of all the chambers are covered with a mass of objects—statues, vases, wooden models of animals, boats, &c. The Public Works Ministry has requested M. Loret to remove only the smaller objects, and to leave the mummies and bodies in their present place. The entrance to the tomb will then be built up until next winter, when iron railings may be placed to prevent injury from touching by visitors.

COLLAPSE OF ROOF.

From Ontario comes the news of another building disaster—this time, a large music-hall at Oshawa, Ontario. The building was of brick, three stories high, and, as in the case of the hall at London we noticed some time ago, the assembly hall was on the upper floor. There was a flat roof, 100ft. by 75ft., which collapsed and fell to the second floor, completely covering the seats of music-hall. Fortunately, the roof fell early in the morning, or the consequences would have been terrible, as in the evening an entertainment was to have taken place in the hall, which is capable of holding 800. The cause of the fall is attributed to the weight of snow on the roof, which was flat. The roof is said to be a new one. The *Canadian Architect*, from which we take these particulars, suggests "that if the title 'architect' was restricted to persons who had passed a qualifying examination, as is now the case in the province of Quebec and the State of Illinois, the public would at least be enabled to know who were qualified to put up safe structures, and could then decide accordingly." We are afraid these buildings are often undertaken as a speculation, and that the owner or company who build them have plans prepared that have not been submitted to any local or municipal authority. Public buildings to hold large numbers of persons ought to be especially looked after, and the only way to secure safety is to submit the designs to some authority before they are allowed to be carried out. A room 100ft. long by 75ft. wide is a large area to be floored and roofed, and particular attention ought to be given to the scantlings of timbers, the size and testing of iron girders, and the construction of roof, whether of timber or iron. We are not told what the roof was constructed of in this instance; no doubt the rafters or ties were insufficient to sustain the extra weight of snow.

MANTEL DECORATION.

[WITH PHOTOLITHOGRAPHIC ILLUSTRATIONS.]

THIS is a design for mantel decoration of simple construction, in which a number of different materials are used on a structure of plain oak. The main enrichment is gesso-work, coloured a pale sea-green, with gold used lightly, as a background, adding a certain piquant richness to the scheme of tender brown and green afforded by the natural oak and coloured gesso. The idea of cupboards and the accidental colour-note of a line of books, and perhaps one or two pieces of old blue and white china, help to give the whole the pleasant effect of being in some degree a useful part of home-life. The grate is surrounded by 3in. square *repoussé* copper plates set in cement, having at sides pilasters of oak 7½in. wide and 5½in. deep to wall. The horizontal band immediately beneath 3½in. ogee moulding supporting mantelshelf is 10½in. wide, having four sunk panels in gesso, coloured green on gilded background. The portion of this band coming between pilasters is one board set on wall, the front surface cut away in four places to leave the three 3in. wide vertical bands projecting ½in. Above mantelshelf a lighter treatment is adopted, the main support of the structure being the 2in. square pieces of wood with simple moulded base, one placed at each corner, the two at back fixed to wall. The space at ends between these supports is filled, up to the china-shelf over cupboards, by a wrought-iron grille, to the centre of which is fixed the bent rod of stouter iron supporting lower candle-brackets. The strap-hinges to cupboards of hammered iron. The ornament supporting upper candle-brackets in centre of frieze of overmantel in gesso (high relief) on shaped wood. G. M. Ellwood.

The St. Pancras Vestry have received a letter from the Home Secretary with reference to the Workmen's Compensation Act, 1897, which comes into operation on the 1st of July next, stating that "he is advised that electric-lighting works, where electricity is generated by the use of mechanical power and is supplied to consumers, are factories within the Factory and Workshops Acts, and therefore the Workmen's Compensation Act will apply in all such cases."

A new United Presbyterian church at Markinch, Fife, was opened yesterday (Thursday). Built on the Balbirnie estate, to designs by Mr. Hippolyte J. Blanc, R.S.A., Edinburgh, the church is in the Early English style, and consists of a nave with one transept and one aisle. The church is seated for from 450 to 500, and the adjoining hall will hold fully 100. The total cost has been £2,800.

Major Dransfield, head of the well-known firm of railway contractors at Manchester and Liverpool, died on Tuesday night at Harrogate at the age of 70. His home was at Sheffield; but he formerly lived at Bootle, where he held a commission in the Artillery Volunteers.

Hepworth Church, Suffolk, was completely destroyed by fire on Monday morning. Nothing but the bare walls and tower were left standing. The village is about eight and a half miles from Finningham station. The church was a quaint structure, dedicated to St. Paul, and stood on high ground, the district being notable for one of the highest ridges in the county. The building was one of rubble and stone, chiefly in the Early English style, with thatched roof; it comprised chancel, nave, south porch, and a western tower, containing a clock and five bells. The restoration and reseating dates from 1855; a new organ was erected in 1892. There were 280 sittings.

Probate of the will of Mr. Edmund Tonks, of Packwood Grange, Knowle, who died on Feb. 7 last, aged 74 years, leaving personal estate of the value of £27,360 3s. 1d., has been granted to the acting executor, his son, John Edgar Tonks. The testator bequeathed his portrait, by the late Frank Holl, R.A., to the Lord Mayor and citizens of Birmingham.

At a meeting of the Bristol Association of Clerks of Works and Builders' Foremen, Mr. W. Kidwell, who is retiring from the duties of secretary to the association, was presented by the members with a valuable case of drawing instruments, in acknowledgment of the very able and courteous manner in which he had discharged the duties of secretary from the commencement of the society till the present time. Mr. J. N. Pike made the presentation on behalf of the members.

OBITUARY.

The death of M. Charles Yriarte, the well-known art critic, took place on Wednesday night in last week after a few days' illness. Of Spanish extraction, he was born in Paris in 1832, and studied architecture under Constant Dufeux. In 1856 he was appointed architectural inspector of the Vincennes and Vesinet Asylums, and afterwards of the Opera, but did not long retain that post. In 1859 he accompanied O'Donnel's expedition to Morocco as artistic correspondent for the *Monde Illustré*; in 1866 in the same capacity he witnessed the liberation of the two Sicilies, and ten years later he acted as secretary to General Vinoy during the Franco-German war. He next wrote for About's paper, the *XIXième Siècle*; but in 1874 to 1876 he travelled in Istria, Dalmatia, Montenegro, and the Balkans, whence he sent articles to the French Press. In 1879 Jules Ferry, unsolicited, appointed him an inspector of fine art, in which post he assisted in organising the 1889 exhibition, and in 1881 he succeeded Gruyer as inspector-general. He was curator of the gallery of Sir Richard Wallace, who was guided by him in the purchase of pictures. He was the author of numerous works of travel and artistic biography and criticism. He was himself also an artist, and exhibited water-colours in the Salon.

The death took place at Peterborough, on Easter Monday, of Mr. Alderman John Thompson, J.P., the well-known church builder. Mr. Thompson, who was seventy-four years of age, had been actively engaged in business up to a few months ago, when a trip to Ireland, where he was engaged in restoring a church, resulted in an attack of yellow jaundice from which he never recovered. He was three times Mayor of his native city, and he was chosen to act in that position in the Diamond Jubilee year. He was the son and successor of the late John Thompson, who some 78 years ago commenced the restoration of Peterborough Cathedral, under Edward Blore, and he was builder of many churches and public buildings, including Glasgow University, the Royal Holloway College at Egham, the Royal College of Music, the Grocers' School, and the Church House at Westminster, on which his men are still engaged. He rebuilt the lantern tower of Peterborough Cathedral, and, under the late Mr. Pearson, R.A., has been engaged in its restoration for many years, while he has also carried out important works of restoration with the late Sir Gilbert Scott and Mr. J. L. Pearson at Salisbury, Lincoln, Winchester, Bangor, Chester, Ripon, Norwich, and Lichfield Cathedrals. He also rebuilt the famous spire of St. Michael's, Coventry, and has carried out various works in the Houses of Parliament. After restoring Viscount Peel's house at Sandy during his Speakership of the House of Commons, Viscount (then Mr.) Peel entertained the workmen to dinner at Peterborough, and spoke in high terms of praise of the wood-carving executed at Mr. Thompson's works, where all the carving of the new choir stalls at Peterborough was done. We gave Mr. Thompson's portrait in our issue of April 4, 1890. The funeral service will take place in Peterborough Cathedral this (Friday) afternoon at two o'clock.

CHIPS.

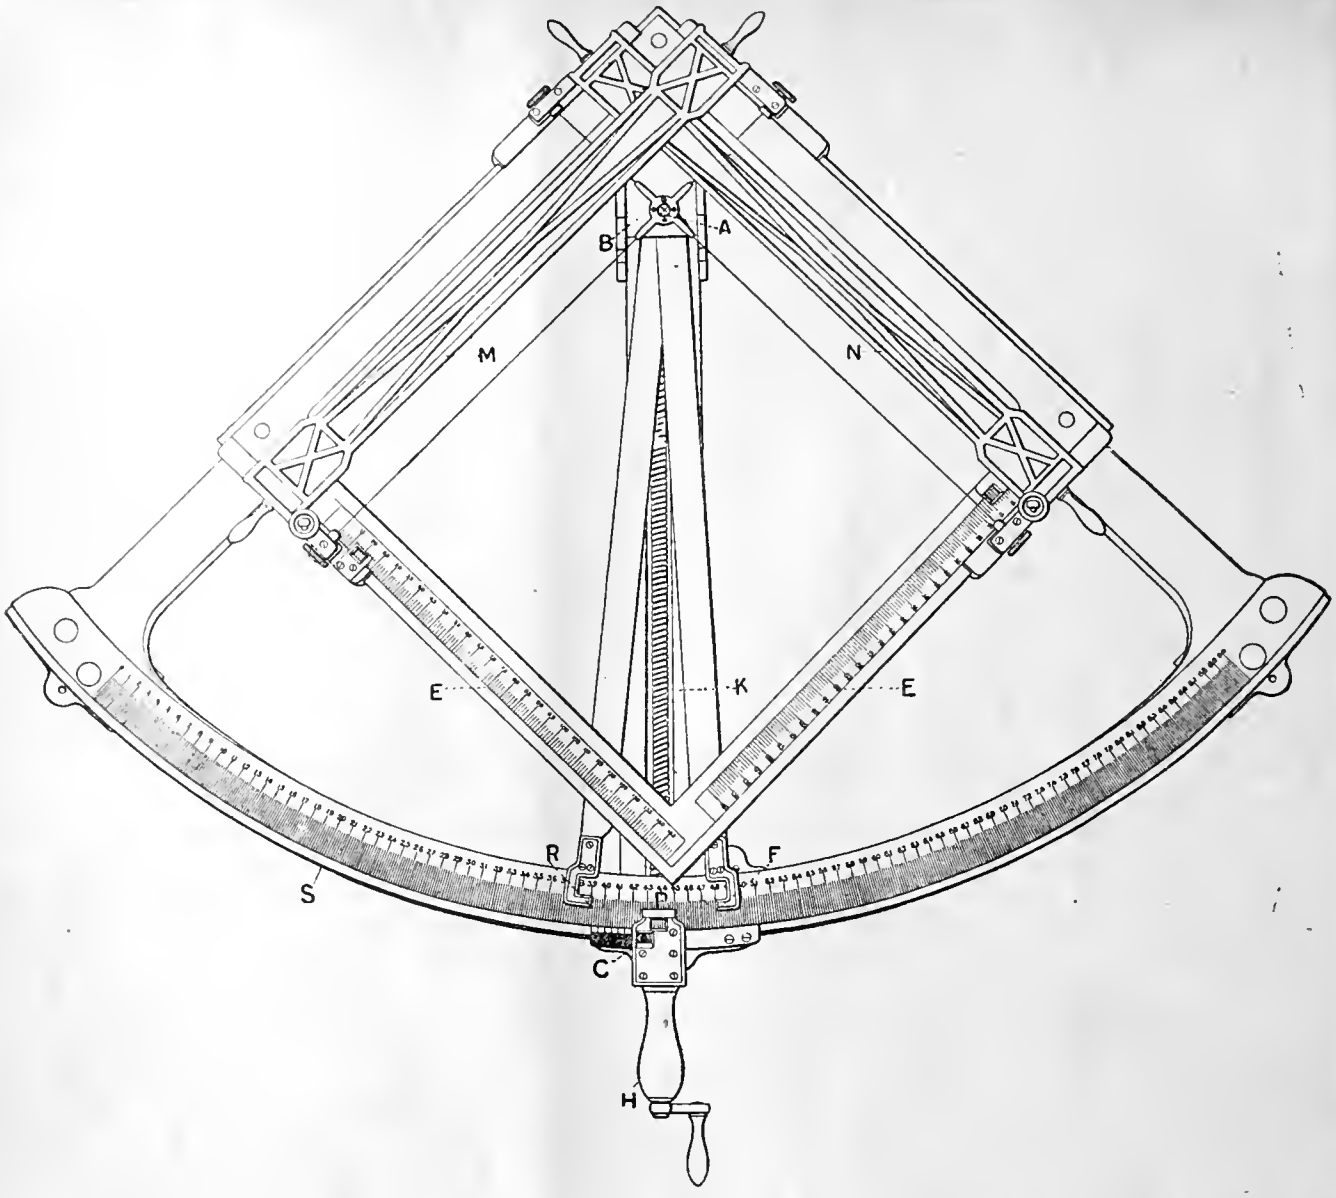
The Bournemouth Corporation have granted Mr. Keene, their building inspector, an honorarium of £50 for extra work performed out of office hours during the past two years.

Gosling's branch of Messrs. Barclay's Bank in Fleet-street is about to be rebuilt from the designs of Mr. Arthur Blomfield, jun. Operations for the demolition of the old premises have been commenced this week.

A meeting of the Haddington Town Council was held on Thursday night in last week to consider the new bridge scheme. A motion that Messrs. Belfrage and Carfrae's report and recommendations be adopted, on condition that the cost to the ratepayers does not exceed £5,000, was rejected after a long discussion by a majority of one.

There will be an inquiry at Winchester to-day (Friday), by Mr. Boulnois, an official from the Local Government Board, as to a loan of £800 for purchasing the site for the public baths of the Old Greyfriars Monastery.

At a meeting of Kirkcaldy Town Council on Monday, a long discussion took place in connection with the building of a new bridge, to cost £14,340, between Pathhead and Kirkcaldy, and eventually it was decided to proceed with its erection.



A BEVEL-GEAR COMPUTING MACHINE.

THE accompanying illustration shows a very interesting machine or instrument for the determination of the various angles required in the construction of bevel gears. It is the design of Mr. James Gleason, of the Gleason Tool Company, Rochester, N.Y. As is well known, the Gleason Company does a large business in planing bevel gears to order, and the tiresome and laborious repetition of the calculations necessary to determine the various angles led Mr. Gleason to consider the advisability of making an apparatus for the graphical determination of the angles, and this device is the result.

A graduated quadrant, S, is divided into degrees, with appropriate subdivisions. A swivelled arm, K, terminates in a handle, H, the centre of motion being at the centre of the quadrant. The crank at the end of the handle actuates the screw shown, which operates the sliding-block B along the arm K. The block B carries three swivelled guides, which embrace corresponding radial auxiliary arms, two of which will be seen in front of K, while the third is in the rear, and out of sight. It terminates below in the auxiliary divided arc C. As the block B is moved upward toward the swivel stud, the three auxiliary arms are separated, while as B is moved downward, a reverse movement of the arms is made.

Slightly nearer the observer than the arm is the rectangular frame E, having edges which guide the two slides M and N. Each of these slides carries a strained wire, which passes freely through the arms of a star, A. The movements of the slides thus give corresponding movements to the star, which can thus be made to occupy any position within the rectangular frame. Accurately divided scales are mounted on two sides of the frame E, while the slides M and N have index marks for setting the slides to the divisions on the scales. These divisions are for the number of teeth in the two gears of a pair respectively, the range running from mitre gears to those having a ratio of 10 to 1.

To illustrate the use of the machine, assume a pair of wheels having 13 and 78 teeth. Slide M is so placed that its index mark stands at division 13 on its scale, and slide N is placed at division 78 of its scale, star A moving to a position determined by these settings. Arm K is now swung about its centre, and block B is adjusted along the arm until a circular button on its front face is brought to match a corresponding button on the rear of the star. These buttons pass close to one another, and the adjustment is accurately made by matching them with the fingers.

The settings are now complete, and locking the arm K in position the readings for the pinion can be taken off. Index mark P gives the pitch cone angle, F the face cone or blank angle, R the root cone or cut angle, and C the angle which the sides of a tooth make with one another, or the "caliper angle," as it is called in the Gleason shops.

For the 78-tooth gear the setting is repeated, but reversed, slide M being now set to 78 and N to 13. The button on block B is adjusted to the one on the star, as before, when the readings give the angles required, as before, but for the gear instead of the pinion. For a pair of mitre gears, of course, single setting only is required.

It will be observed that the pitch of the tooth is not a factor so long as uniform proportions of teeth are used—which, in fact, is the fundamental idea of the machine. Two pairs of gears of the same number of teeth, but of different pitches, may be considered as being parts of the same cones, but with the coarser pitch gears located farther from the apexes of the cones, from which consideration it is plain that the various angles will be the same in both sets.

The size of the machine and divisions of the scales are such that the angles can be read to within one minute of arc.

As used in the Gleason works, the machine is mounted permanently on the wall, where it can be consulted as desired and as occasion arises. We judge from what we saw of it that its usefulness is quite up to its ingenuity—which is saying a good deal.—*American Machinist.*

CHIPS.

Sir W. B. Richmond, R.A., has written to the *Times*, expressing his regret that owing to absence from England he had no opportunity of adding his name to those of his colleagues who signed a letter "in which was expressed just admiration for Mr. Shaw's New Scotland Yard, a building which does honour to the great architect who designed it and to the city in which it stands."

The urban district council of Exmouth decided at their last meeting to give a month's notice to terminate his engagement to Mr. Beswick, their surveyor.

Mr. Augustus Laver, an architect who died in Alameda, Cal., March 28, had designed some prominent public and private buildings in San Francisco and elsewhere in the Pacific States.

The new museum at Keswick, erected in memory of Thomas and Henry Hewitson, the donors of the Fitz Park, was opened on Tuesday. It has been erected from plans by Mr. Thomas Hodgson.

The finance committee of the Camberwell Vestry has recommended that a grant of 300 guineas should be made to the family of the late surveyor, Mr. O. S. Brown, to be applied for the benefit of the younger children, under the direction and discretion of the finance committee.

The Hygienic Congress was opened at Madrid on Saturday. The delegates were welcomed by the Minister of the Interior.

A branch line of railway is about to be constructed from Fort George station to the village of Campbelltown, Ardersier, a distance of two miles. The execution of the contract, which has been secured by Messrs. Chisholm and Co., Dingwall, will be comparatively easy, as the ground is nearly level.

Our Illustrations.

RHOS ABBEY HOTEL, RHOS-ON-SEA, NORTH WALES.

This hotel is now in course of erection upon a site familiar to Welsh historians, known as Rhos Abbey, commanding extensive sea views towards Colwyn Bay, Abergele, and Rhyl, with some splendid mountain scenery in the background. The hotel also overlooks the ancient Fishing Weir, which was in existence previous to Queen Elizabeth's time. The plans have been prepared by Messrs. Booth, Chadwick, and Porter, architects, Manchester and Colwyn Bay, and the work is being carried out under their supervision.

NATIONAL SILVER MEDAL DRAWINGS: CHIMNEY-PIECES, BOLSOVER CASTLE.

Mr. Alfred B. Illston has sent us the following brief history of Bolsover Castle, to accompany his prize-medal series of drawings of the famous Renaissance chimneypieces, which form one of the main features of interest in this very interesting Derbyshire building. Bolsover, a small county town about six miles east of Chesterfield, is situated in what is now a busy mining district. So rapidly has this industry developed that six different pit-heads can be seen from the battlement of the tower, from which in past days a grand and extensive view of hill and dale, together with the noted seats of Haddon and Hardwick, were visible. Yet in other days it had a very different history, and for a period of about five centuries it was a busy market-town, renowned for its manufacture of tobacco pipes (which occupation still lingers in the district), spurs, and buckles; so celebrated, indeed, were the Bolsover buckles for their elasticity, that it is said a loaded cart's wheel could pass over them without in any way affecting their shape. At the time of Domesday, the manor of Bolsover belonged to William Peverell, who is supposed to have built the first castle. In 1189 we find the castle, together with the manor, given by Richard I. to his brother John on the occasion of his marriage. During the Magna Charta struggle, in the 18th year of his reign, John issued a mandate to the governor of Bolsover to fortify the castle and hold it against the rebellious barons, and this no doubt was the period when the fortifications, which are still visible about the village, were established. In 1215 the castle was in the possession of the barons, but was taken from them by assault for the King (John) by William de Ferrars, Earl of Derby. In 1456 the Earl of Richmond died possessed of it, and in 1514 it was granted to Thomas Howard, Duke of Norfolk, on the attainder of whose son it once again reverted to the Crown. When Edward VI. bestowed it on the Earl of Shrewsbury, the ancient fortress was fast decaying, and so little pains were taken to preserve it, that by the time the seventeenth century dawned it was a mass of ruins. In 1613 the Earl of Shrewsbury sold Bolsover to Sir Charles Cavendish, and in the year of his purchase he cleared the tottering ruins of the Norman keep, and on the same site the foundations of the new house or present castle were laid. This building is situated on the bank of a high limestone rock, at a considerable elevation above the valley. It is a square, lofty fabric of brown stone, having a tower at each angle, the one at the N.E. corner being of much larger dimensions; in the centre is a cupola, giving light to rooms below, and a turret at each corner to serve as protection for the soldiers on guard, or for watch-towers. This building, however, was evidently not really built as a fortress, but rather for a domestic residence. The architect is said to have been Huntingdon Smithson. The entrance from the village appears to have been by a roadway or terrace formed by the edge of the rock to a flight of steps leading into a high inclosed small courtyard, in which are two small outhouses. Over the entrance-door is a figure of Hercules supporting on his massive shoulders the heavy balcony above. By this door we enter the Hall. It has an elaborate groined ceiling, which springs from two circular stone pillars. The floor is diaper pattern, interlaid with black and grey marble. The walls are wainscoted with black oak, and decorated with gilt ornamentations of the period. In this apartment is the beautifully decorated mantle, composed of yellow sandstone, white and black marble and alabaster, bearing at the top the supporters and coat of arms of the Cavendish family, with a canopy of white marble. From this we pass into the "pillar parlour." This is an apartment of similar construction, being 78ft. by 33ft.; it, too, has an arched roof supported by a central pillar, round which is a plane circular dining-table. The wainscoted walls are also decorated with gilt devices, and at each end of the room are painted very delicate frescoes. From these rooms you pass up a stone staircase to a corridor leading into the various rooms, from which the illustrations are gathered. The largest of these rooms is the Star Chamber: this is a room 220ft. by 28ft., with its decorated ceiling of blue and gold, its rich chimneypiece composed of alabaster, sandstone, blue and grey marble, bearing the full coat-of-arms of the Cavendish family, and being splendidly decorated with side panels of war trophies, as shown in the drawing on the left-hand side. The walls are decorated with portraits of the Twelve Cæsars; the floors are of plaster, reminding us of the time when rushes were in use as floor-coverings. From this room you pass along the corridor, up one or two stone steps leading into various smaller rooms, which, from their appearance, may have been used as sleeping apartments. In the rooms are smaller pointed corner mantels lavishly decorated with ornamentations of the time, with bosses of various coloured marble. The mouldings are of alabaster and sandstone inlaid with black marble. We shall illustrate these shortly. There are other rooms, one of which must have been the drawing-room, being 39ft. by 33ft., and having a small ante-room in one corner. In this apartment is a large semi-octagonal mantle composed of sandstone and alabaster, bearing musical and literary devices on the jambs. The floor is of plaster, the walls wainscoted, with recesses and shelves at intervals; but which may have been placed there at a later date, as the place is said to have been converted into a museum. From this room you go down the passage to a room of similar dimensions. This is a plain, square apartment, with plaster floor, wainscoted walls, and also having a small ante-room at each side of the chimneypiece, which is placed in the centre at the far end of the apartment. This chimneypiece, herewith illustrated, is rectangular in plan, and bears small shields with the constituents of the Cavendish arms. In the centre is a square slab of slate, with a guilloche moulding running round and decorated with pieces of inlaid black marble, supported at each side by a scroll of the Tudor style. Above this is a small niche, with a semicircular top, which perhaps has been the resting-place of some family relic in bygone times. Hitherto I have only spoken of that part of Bolsover Castle called the "Little House," to distinguish it from the more magnificent structure adjoining—a range of apartments now roofless and rent into fissures, of which only the outside walls are standing. It is thought that this long block of buildings was erected at the time of the restoration of the keep. But Diepenbeck's view of Bolsover (1652), however, decides the point of their previous existence, and that they were built before the time of the Civil Wars is more than probable, as otherwise there would have been no room at Bolsover for the splendid entertainment which the Earl of Newcastle gave to King Charles, the Queen and Court, and all the gentry of the country. It now belongs to the Duke of Portland, whose family derived it in the female line from the Newcastle Cavendishes. The whole pile is now fast wearing away. Trees are growing in some of the deserted apartments, and ivy creeps along the walls, although the place wears little of the picturesqueness of decay. Two views of the Castle were given in the Building News for Aug. 24, 1888.

MANTEL DECORATION.

(For description, see p. 525.)

BALHAM LIBRARY.

This branch library, which will be opened in a few weeks' time, is being built in two sections, the first of which is just completed; the magazine-room being now used as a lending library. The library is under the control of the Streatham Libraries Commissioners. The materials used in construction are red bricks, Portland stone, and green slate, while all arches are done in a specially made red tile. The builder is Mr. T. Wallis, of Balham; Mr. G. Bull being clerk of works. Considerable difficulty was experienced in the foundations as the building was on the site of an old gravel-pit, and piers (on which the building stands) had to be carried down very deep. The site was presented to the Commissioners by Mr. Henry Tate, J.P., of Streatham, and the library is being erected by them as a branch of the Streatham Library, which will be the central one of several branches.

"BUILDING NEWS" DESIGNING CLUB: A CONVALESCENT HOME.

(For description and awards see p. 517.)

WHITBY ABBEY, YORKSHIRE.

The accompaying drawings, which are strictly accurate in every detail, and have been measured from the building itself, illustrate the choir arcading of Whitby Abbey, which is recognised as being one of the finest examples of (13th-century Gothic or) Early English architecture. The stone is from local quarries, and the arcading now remaining is in splendid preservation as regards detail. Characteristic of this period of architecture are the mouldings, which are both effective and graceful in outline. The triforium stage is surmounted by a graceful five-arched clerestory arcading, which, by the diminishing proportions both in detail and general outline, and the figured terminals to the arches, distinguishes the composition, and gives a pleasing effect. The main arcading is also profusely moulded, and of graceful proportions, the whole constituting a composition worthy of study by those interested in architecture. This ruin stands on a commanding cliff overlooking the North Sea, which greatly enhances the beauty of its architecture.

Archibald H. Winterburn.

THE CASINO, VILLA PAMPHILI-DORIA, ROME.

Alessandro Algardi was the architect of this well-known Casino. The grounds were laid out by the same artist, acting conjointly with Antinori. The estate was the gift of Innocent X. to Olimpia Maidalchini, his brother's wife, in 1650. The gardens which form so prominent a feature in all the views on this side of the city, add materially to the beauty of the spot. They are laid out in avennes, terraces, and plantations, dominated by the lofty pines which give the place so conspicuous a character in the landscape. Garibaldi's republican troops occupied the casino and grounds in 1849, and the great emancipator maintained his position here for many weeks against the concentrated attack of the French army. Needless to say during the onslaught which ensued the gardens, terraces, statues, and buildings were much injured. The drawing, which we have borrowed from our contemporary the *American Architect*, gives an admirable idea of the gardens now as seen close to Algardi's Casino.

Engineering Notes.

Aberlady and Gullane Railway.—Colonel Addison, of the Board of Trade, has made an inspection of the new Aberlady and Gullane Railway, which has been opened for passenger traffic. The engineers of the line are Messrs. Blyth and Westland, C.E., and Mr. Bell is chief engineer; Mr. John Howard, London, is the contractor. The new railway, which is about five miles in length, branches off from the main line of the North British Railway about a mile and a half east of Longniddry Junction. The line is of a winding nature, and the central portion for 3½ miles is fairly level. The station-houses both at Aberlady and Gullane each have a passenger platform 140 yards long, while siding accommodation has also been provided for goods traffic. The heaviest works in connection with the railway were at Gullane Station, which has been excavated in hard boulder clay. The bridges are all faced with coarse freestone ashlar, mostly brought from Fife, and the superstructures are of steel girders.

Great Central Railway.—It is anticipated that the new trunk line of the Great Central Railway, forming an extension of the Manchester, Sheffield, and Lincolnshire system from Annesley to London, will be ready to be utilised for the conveyance of coal to the Metropolis by August next. Though the directors have already obtained, for the purposes of a coal-yard at the London terminus, some 20 acres of ground, a Bill is before Parliament in the present session by which is sought authority to acquire the property requisite in order to enable them to double the area of this depot. The red brick and terracotta buildings which will form the terminal station at Marylebone have reached the first-floor level throughout, and in parts have been carried up to the second floor. The subway, which will form one of the means of communication between the station and the large hotel that is being built for the Gordons Hotel Company on an adjacent site, has been completed: but a covered way, which will pass overhead across the street which separates the two blocks of buildings, has yet to be constructed. The erection of a warehouse, having five floors and a total floor-space of about 11½ acres, in proximity to the passenger-station, is a section of the work of which a considerable part still remains to be done; but already the hydraulic cranes and litts which will form a portion of its equipment have been delivered, and a sufficient area of the buildings required for the reception of goods traffic will be ready for use by the beginning of October. The goods traffic offices, which will form a large block of buildings lying back at some little distance from the main front of the terminal station and facing upon a side street, are being erected, and among other buildings that it has been decided to add at Marylebone are a carriage-shop and a large shop to serve as the place of manufacture of oil-gas to be utilised for the illumination of the railway carriages. Another carriage-shop and a waggon-shop will be added to the company's premises at Neasden, where a shunting-yard and a large engine-shed are to be provided. All the "cut-and-cover" portion of constructing the Metropolitan section of the railway, including that section in which the line passes beneath Lord's Cricket Ground, and all the tunnelling, have been completed, and the rails have been laid from St. John's Wood-road to Finchley-road, a distance of considerably over a mile. From this latter point on in a north-westerly direction, for a distance of about 40 miles, the Great Central Company's trains will pass over the Metropolitan Company's system, which, for the length between Finchley-road and Harrow, is having its number of lines increased.

Wadebridge and Padstow Railway.—Rapid progress is being made with the construction of this railway. The station-house and platform at Padstow are almost completed. The station-house has been literally built in a pit, the top of it only reaching to the surrounding surface, and some hundreds of square yards of rubble and rock must be removed before the line can be opened. This rubble and rock will be thrown into the old shipwright docks, which, when filled up, will provide space for the purpose of a railway wharf. After crossing Dennis Cove on an embankment the line penetrates Dennis Hill—a cutting about 35 yards long, varying in height from 10ft. to 50ft. At the end of this cutting is the bridge or viaduct across the Sea Mills River, a distance of 100 yards; two-thirds of this space consists of an embankment, which has already been formed. In the remaining space is now being constructed an iron viaduct, carried on iron tubes driven into the mud. The bridge will only leave sufficient head room for the barges to pass under. The line when made will be nearly level, and will be only a few feet above high-water mark. The cutting at Ball Hill represents the heaviest portion of the work yet to be done. This cutting, which is to be an open one, will not be less than 70ft. deep, and necessarily very broad.

CHIPS.

At Harborne Parish Church, the old seats occupied by the choir have just been replaced by oak carved stalls. They were occupied on Sunday for the first time. They have been erected from designs from Mr. R. Heaton, of Corporation-street, Birmingham, and the work has been executed by Mr. H. H. Martyn, carver, of Cheltenham. A clergy stall was also utilised on Sunday.

The well-known engineer Privy Councillor Bausch, who was charged by the Imperial Ministry of the Interior of the German Government with the cutting of the Emperor William Canal, died on Friday.

The old Wesleyan Chapel at Guisely has, through the enterprise of a local firm of contractors (Messrs. S. Mounsey and Son), been converted into public baths. Besides a number of slipper, vapour, and other baths, there is a large swimming-bath, measuring 49ft. long by 19ft. wide, and varying in depth from 4ft. to 6ft. The bottom is of white tiles, and the sides of white glazed bricks. The dressing-boxes, fifteen in number, have open fronts, this method having been adopted to prevent thefts from the clothes of the swimmers. The formal opening took place on Saturday.

On Thursday in last week, Colonel A. G. Durnford, R.E., one of the Local Government Board's inspectors, held a public inquiry at Wrexham, respecting the application of the town council for sanction to borrow the sum of £30,750 for purchasing the Wrexham Market Hall Company's property and undertaking, and the sum of £340 to purchase the Beast Market, to be left as an open space for ever.

Before quitting office as High Sheriff of Devon, Mr. Robert Harvey, of Palace Gate and Dundridge, Totnes, has placed two memorial windows in the north aisle of Truro Cathedral. The subjects are St. Alban, St. Pancras, St. Perpetua, St. Lawrence, St. Catherine, and St. Cyprian. Mr. Harvey has also added a thanksgiving window, an illuminated clock and chimes, and restored the churchyard cross in his own parish of Harberton.

An organ and screen were dedicated at the Church of St. John, Knotty Ash, Lancs, on Monday. The work has been carried out from the designs of Mr. Charles E. Deacon, architect, of Liverpool. The organ, which is fitted with pneumatic action, is inclosed in a carved oaken case, designed in harmony with its surroundings, and being supported upon a carved canopy, springing from the screen, beneath which runs the whole length of the choir stalls. The organ has been made by Messrs. Conacher and Co., of Huddersfield; whilst all the oakwork is from the studios of Messrs. Harry Hems and Sons, of Exeter.

The Boards of Guardians of Manchester and Chorlton, acting together under the authority of the Local Government Board, have purchased an estate in the neighbourhood of Chorley with the object of erecting cottage homes for the treatment of imbeciles and epileptics. The site is under the shadow of Rivington Pike, and has cost a sum of £19,000. The Boards jointly aim at accommodating 1,000 patients.

A new Episcopalian Church of St. Peter is in course of erection at Torry, N.B., from plans by Messrs. Kinross and Tarbolton, of Edinburgh, at a cost of £5,000. The building consists of a narrow and lofty nave, with north and south aisles. The roof will have a span of 35ft., and will rise 60ft. above the floor. The walling is of pink granite, and when completed the church will seat 600 persons.

The foundation-stone of an intermediate school was laid at Penygroes on Monday. The contract has been let to Mr. Richard Jones, Llanwrda, the architect being Mr. Evan Evans, C.E., the county surveyor of Carnarvonshire. The total cost of the work will be £2,763.

A Jubilee memorial clock has been placed in the tower of East Farleigh parish church, Kent. The clock, which was manufactured by Messrs. J. Smith and Sons, of Derby, makers of the clock in St. Paul's Cathedral, chimes the Cambridge quarter on the 1st, 2nd, 3rd, and 6th bells, striking the hours on the tenor. It has one dial, 5ft. 6in. in diameter, facing the south.

Building Intelligence.

Bury, Lancs.—The new Park Congregational chapel was opened on Good Friday. It is Jacobean in style, and measures 77ft. by 39ft. A vestry for the minister is placed at the south-east angle of the building, and the gallery is over the vestibule at the west end. The chapel contains seating accommodation for 450 persons. The benches and the interior woodwork are in pitch-pine. The building is faced with Yorkshire parpoints. The chapel has been erected from the designs of Mr. J. D. Mould, architect, of Silver-street, Bury. The main contract was placed with Messrs. T. and J. Foster, of Ramsbottom.

Old Kilpatrick, N.B.—After being closed for over three months, the Old Kilpatrick Parish Church was reopened on Sunday. The reason for the closing was the alteration and improvement of the building, consequent on a number of gifts having been presented in commemoration of the Queen's Diamond Jubilee. These include a three-manual pipe organ and an apse in which to house it, and a new pulpit, hexagonal in form, built of blue Ayrshire stone, with a top of oak, Gothic arched in each side. A peal of eight bells, cast by Gillett and Johnston, of Croydon, has also been presented. They weigh three tons without machinery. An oak carved Communion table and a baptismal font, made of blue Ayrshire stone, matching the pulpit, are other gifts. The church has been painted, and new heating apparatus put in. A four-light window of stained glass representing the Ascension has been placed in the centre of the apse, while at the sides two other windows representing the Four Evangelists have also been given.

Stratford-on-Avon.—Lloyds' Bank (Limited) are about to erect new bank buildings upon the site of their present premises at the corner of Bridge-street and Union-street, Stratford-on-Avon. The old buildings are now in course of demolition. The plans of the new bank, which have been prepared by Mr. J. A. Chatwin, of Temple-street, Birmingham, show a much larger structure. The building will provide a banking-room next Bridge-street, with consulting and waiting rooms, strong rooms, and residence for the manager. The elevations in Bridge-street and Union-street will be of Bath stone, and the principal entrance will be at the corner of the streets named, with oriel window projecting over, and surmounted by a short spire, which will form a feature as seen from High-street. The extent of frontage to Bridge-street will be 42ft., and that to Union-street 52ft. (including manager's house), and the height to ridge will be 51ft. with a slightly lower elevation to Union-street. The corner entrance will be recessed, and the oriel window over—a feature of the building—is carried by groins springing out of the keystone of the doorway. There are carved panels between the corner windows. The lower range of windows in Bridge-street will have pilasters and columns between: the middle range contain mullions and transoms, while the top range will be of a more ornate character. There will be six large windows on the ground floor of the banking-room, which will be 38ft. by 20ft. All the bank fittings will be of mahogany, and the building will be lighted and ventilated by an inner court, extending the full height of the building, cased with white brick. The style adopted is Renaissance. A low ornamental palisading will protect the stonework from being scored or scratched. The builders are Messrs. Collins and Godfrey, of Tewkesbury.

The corporation of Scarborough have adopted a recommendation of the committee that they should purchase for £33,000 the mansion and grounds of Mr. J. W. Woodall in St. Nicholas-street. The house is to be converted into public offices, and the grounds on the undercliff facing the sea are to be used as a public park.

On May 4, the anniversary of the terrible bazaar catastrophe in the Rue Jean Goujon, Cardinal Richard will lay the foundation-stone of a chapel to commemorate that fatal disaster. M. Guilbert, the architect, has adopted the semi-classical style associated in France with the name of Louis XVI. His building, almost square outside, is to be raised some 10ft. above the level of the street. Within, the chapel will have a circular form, eight marble pillars supporting the central dome. Beside the building a small space is to be laid out as a garden and surrounded by an arcade with the stations of the Cross.

COMPETITIONS.

Birmingham: Hollymoor Asylum. — The competitive plans for the erection of a new lunatic asylum on the Hollymoor estate, near Rubery, are now open to inspection. It may be remembered that the need for increased accommodation for lunatics having become urgent, the Asylums Committee proposed to entrust the preparation of plans to Messrs. Martin and Chamberlain, who designed the present establishment at Rubery. The majority of the city council, however, rejected the recommendation, and decided that a limited competition should take place by six Birmingham firms, to each of whom £100 should be given for the preparation of plans. As we stated last week, on the report of the assessor, Mr. G. T. Hine, the committee have selected the designs marked "Forward," which proved to be the motto adopted by the firm to whom they originally recommended that the commission should be given. The other five competing firms were Messrs. Cossins and Peacock, Messrs. Mansell, Mr. F. B. Osborn, Messrs. Ingall, and Messrs. Cross and Nicholls. The asylum is to accommodate 800 patients and the necessary staff. Access to the site is by Bedlam-lane, which skirts it upon the north-west, and the selected plans and several others place the main entrance and the medical superintendent's house at the nearest corner to the road. The selected plans and several others show, says the *Birmingham Post*, a system of corridors, of which the one on the north side runs from east to west, while another makes a semicircular sweep to the south. Within the inclosure formed by these corridors are arranged the large dining and recreation hall, with the kitchens and other kindred departments, while the wards or pavilions are upon the exterior of the circuit. Messrs. Martin and Chamberlain place their reception wards and infirmary wards entirely upon the ground floor. The pavilions are in two stories, and the upper stories of the infirmary blocks are used as dormitories for chronic patients. As a rule, a pavilion and two wings of separate apartments inclose a quadrangle to be used as an airing-court, and the ground-floor arrangement enables the weaker infirmary patients and their attendants to reach the airing-courts with the least possible fatigue. The pavilions are mostly arranged in an east and west direction, so that the windows may enjoy a southern aspect, and that the patients may enjoy the utmost benefit derivable from light and air. The elevations show a somewhat severe brick structure with mouldings beneath the eaves, and window bays to break the otherwise flat monotony of the walls. A water-tower is provided for, which will carry a tank of 40,000gal., a little more than a day's supply. Messrs. Martin and Chamberlain submit an alternative ground plan, in which the arrangement of blocks and corridors is somewhat different, and less widely distributed. The buildings have been arranged to follow, as far as practicable, the fall of the ground, the variations of level giving a gentle rise and fall in the corridors, by which the occurrence of odd steps is avoided. In the plans marked "Control," the blocks of building are more symmetrically and more compactly arranged. The entrance is centrally placed on the north side, and has a Renaissance elevation. An east and west corridor, and a semicircular one reaching to the southern limits of the group of buildings, are also features of the plan. The architects are Messrs. Cossins and Peacock. Mr. Osborn's plan (marked with a cross) shows the general arrangement of buildings placed aslant, so as to be roughly parallel to Bedlam-lane, and giving south-east and north-west aspects to the principal blocks. The corridors are placed at angles to one another. The entrance is from a private drive to the south, and a clock-tower occurs as a decorative feature of the architecture. Messrs. Mansell and Ingall both adopt a rectangular arrangement of buildings, and the former show an Elizabethan design for the entrance; while Messrs. Cross and Nicholls dispose their buildings in relation to a straight corridor on the north and a semicircular one on the south.

Derby.—In November last the committee of Holy Trinity parish church, Derby, presided over by the Rev. H. Martin, B.A., vicar, had the consideration of rebuilding before them, and in consequence of a request by Messrs. Naylor and Sale, architects, of Derby, to be allowed to submit sketches for a new church (which was in contemplation), it was resolved that this firm should send in sketches in competition with Mr. Charles E. Hewitt, architect, of Brighton, who had been acting as professional adviser to the church committee for about four years. Certain conditions of this competition were given. A sub-committee was formed to report on the merits of the submitted designs, which were three in number, Messrs. Naylor and Sale submitting two designs, and on March 14th the sub-committee met to inspect the designs and to recommend the design which they considered best. The committee unanimously decided in favour of the design submitted by Mr. C. E. Hewitt, and this recommendation was confirmed by the church committee last Tuesday, April the 5th, when his appointment as architect was made. The proposed new church is to occupy the same site as the existing church, and is designed to accommodate 800. It is to be constructed of red brick, with stone dressings, in the Early English style of Gothic architecture. There will be a nave, with clerestory, aisles, transepts, and chancel, with a west-end tower, to be surmounted (eventually) with a stone spire, the apex of which will rise about 132ft. from the ground. The organ and choir will be accommodated in a western organ gallery. The estimated cost of the new church is £6,000, exclusive of the spire.

Dukinfield.—The urban district council, having decided to erect a town hall at a cost of £10,000, advertised for competitive plans, offering prizes of £40 and £20. In response, 22 sets of plans were received. The prizes have now been awarded as follows: First premium, John Eaton, Sons, and Cantrell, Ashton-under-Lyne; second, Hindley and Marshall, Manton, Eccles. The new town hall is one of the Diamond Jubilee commemoration schemes.

Harrogate Technical School.—Mr. Morley, architect, of Harrogate and Bradford, who secured the first premium in connection with the competitive designs for a new technical school at Harrogate, has been appointed architect for the new building. Mr. Morley has been instructed to get out specifications for his plans, and amended plans, and report to a future meeting. A site for the school has been secured at the corner of East-parade and Bower-road.

Surbiton.—The designs of Messrs. Carter and Ashworth, of 55, Clarence-street, Kingston-on-Thames, and 8, Duke-street, Adelphi, W.C., have been placed first in a limited competition for a new club-house in St. James's-road, Surbiton, for the Surbiton Club. The building, which is to cost £2,750, will be proceeded with at once.

CHIPS.

Mr. Herbert H. Law, L.G.B. inspector, has held an inquiry at Bognor into an application of the urban district council to borrow £2,000 for the construction of a new sea-wall and esplanade at the west end, near the Black Mill.

The Clippens Oil Company are reopening the Straiton Quarries, which were carried on for forty years previous to 1885. The material is freestone, the greater part of Newington, Edinburgh, and the whole of the Loanhead district having been built with it. The reopening will afford employment to a number of men, and will help to lessen the distress caused by the stoppage of the oilworks.

A committee of the town council of Glasgow recommends the purchase of A. K. Brown's "Spring" landscape, and an "Interior" by Tom M'Ewan. The pictures are now in the exhibition of the Royal Glasgow Institute.

The City Council of Birmingham have raised the salary of Mr. John Price, city surveyor, who had resigned the office of deputy engineer to the Birmingham Tame and Rea District Drainage Board, to £1,000 per annum.

Mr. Protherd, of Cheltenham, has reported to the churchwardens of Wrexham on the condition of the fine Perpendicular parish church, and states that a displacement of the masonry of the south porch is in progress, while the whole of the fabric will have to be attended to before long. One of the pinnacles of the noble west tower is being repaired.

On Thursday in last week Mr. H. T. Tulloch, one of the Inspectors of the Local Government Board, held an inquiry at Bournemouth into the application of the town council to borrow £8,000 for sewerage, £500 for the continuation of Braidley-road, £1,050 for public walks and pleasure grounds improvements, £980 for private street improvements, £2,500 for lighting the pier and lower Pleasure Gardens with electricity, £260 for work on the Dean Park Horse Shoe site, and for power to borrow £1,730 for the purposes of the Bournemouth Corporation Act, 1897. Evideuce was given by Mr. Lacey, the borough surveyor.

PROFESSIONAL AND TRADE SOCIETIES.

Edinburgh Architectural Association.—At the last meeting of this association, Mr. Thomas Ross, the president, in the chair, Bailie Pollard, convener of the Town Council's Public Health Committee, gave an address on "Fever Hospital Structure, with special reference to the new City Hospital at Colinton Mains." Having given a brief sketch of the history of the development of isolation hospitals, the lecturer said that down to the early sixties, and even later, the treatment of fevers in our large cities was without skill, proper nursing, or adequate appliances. Mainly through the instrumentality of the late Mr. Ernest Hart, a great reform was effected five-and-twenty years ago, when efficient fever hospitals began to be erected under the charge of the Metropolitan Asylums Board. In France and Germany greater progress had been made. It was only in recent years that local authorities throughout Great Britain had been aroused by public opinion and legislation, so that infectious hospitals were now becoming general all over the country. The prime consideration for the architect of a fever hospital must be to make his structure an instrument of healing. External appearance was not to be despised; but the internal arrangements must receive closest study and most minute care. With reference to situation, well regulated fever hospitals might exist even in populous centres, without detriment to the community. When the choice of a site was in view, many reasons showed that the hospital was best at a distance from other dwellings, not so much from fear of spreading disease as for the sake of the institution itself. Differing from Sir Thorne Thorne, of the Local Government Board, who suggested hospital provision for one per 1,000 of the inhabitants, the lecturer advocated larger hospital accommodation, and, upon experience of Edinburgh, was prepared to maintain that provision should be made for one in every 600. The materials of the structure might be pasteboard, canvas, wood, brick, or stone. Stone was preferred in Scotland. The laying out and arrangement of buildings was dwelt upon, and it was shown how needful it was that the different diseases should be classified, and cross-infection guarded against; while the different parts of the whole structure should be so placed as to secure greatest convenience of access between the sick-rooms and the administrative, culinary, and other departments. Drainage, ventilation, and heating were then described as elements of essential importance, the requisite amount of floor-space and air-space per bed being also alluded to. The laying-out of wards and of ward accessories, baths, and lavatories was next discussed. Dwellings for the doctors, nurses, ward attendants, and servants were described, and the most suitable arrangements for kitchen, laundry, and other services were dealt with. After setting forth the main objects to be sought in a completely efficient modern hospital, Bailie Pollard proceeded to show how these were likely to be obtained in the new city hospital at Colinton Mains. He exhibited by the limelight a series of views from the plans prepared by Mr. Robert Morham, city architect. Speaking from considerable acquaintance with fever hospitals on the Continent and at home, the lecturer felt warranted in saying that by means of Mr. Morham's plans the Edinburgh Hospital would at its opening be behind no fever hospital in the world in respect of efficiency. He directed special attention to the situation of the hospital, with its southern exposure and uninterrupted sunlight. Particular mention was also made of the large provision of sun-rooms for patients during convalescence.

Contracts have been entered into by the British Electric Traction Company for the conversion of the tramway line running from Hart's Hill to Stourbridge into an electric system, and it is expected that the work will be done during the next six months. Other improvements and extensions are also contemplated.

The foundation-stone of the new church and convent of the Immaculate Conception of St. Francis, at Bocking Bridge, has been laid. The architect is Mr. J. F. Bentley. Messrs. A. Brown and Son are the builders, and Mr. W. L. Tett is clerk of the works. The buildings comprise a church with sanctuary chapel and transept, and the cells, corridor, refectory, and kitchen of a religious house. The church, which is to be of red brick with stone dressings, is in the Early Decorated style.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Chequea and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 35fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—J. and H. O.—D. N. P.—W. C. A. Co.—R. F. A.—A. B. and Sons (Bristol).

"BUILDING NEWS" DESIGNING CLUB.

Drawings Received.—"Luna," "McGilligan," "Gib," "Derige," "Don't Know," "Rita," "Centaur," "B. C. P.," "Swan," "Microbe," "Hotspur," "Zeo," "Petticoats," "Pantile," "Caedmon," "Umbopa."

Correspondence.

SYBILS—NOT ANGELS.

To the Editor of the Building News.

Sir,—In your issue of March 18, 1898, there occurs a mistake of the most serious order. The large reproduction you have of Michel Angelo's Sybils is labelled "Figures of Angels." I am greatly surprised that in your article the well-known sybils are also referred to as "angels." Being sybils, they were naturally wingless, so that your contention about these angels being wingless is most amusing. I trust that for the benefit of your many readers you will correct this error in the next number of your esteemed periodical. Such mistakes as this should not be allowed to occur. When they do occur the misinformation which they convey should be promptly rectified.—I am, &c. A. A. Hopkins.

361, Broadway, N.Y. City.

KIRKHAM WORKHOUSE COMPETITION.

Sir,—Having competed for the above together with Mr. Fred. E. Dotchin, of Newcastle-on-Tyne, it is with much regret I observe the letter from Messrs. Crickmay and Son (the first premiated) in your issue of the 8th inst.

It is becoming positively disgraceful the way in which the majority of the architectural competitions are apparently conducted, and the final decisions arrived at—even as in this case, when the award of an assessor is given, this is not eventually adhered to.

It is only within the last few months that I competed successfully for a large Poor-law establishment for the Gateshead-on-Tyne Guardians. I was appointed to carry out the work, and prepared all the contract drawings, specifications, quantities, deposited plans with the Local Government Board, which were passed and sealed. I also deposited the plans with the local authorities, and tenders were received, and all in order for the due performance of the contract, and now, after months of untiring work and great expense, I am compelled by the guardians, under their conditions of competition, to step aside and relinquish my position, and allow a local architect to be appointed by the guardians in my place, and so carry out the work, and, as I presume, from my drawings, &c., and receive the commission due to me.

It is only an architect that can form an adequate idea of the enormous amount of work I had to do from first to last, and for which I have not received a proper remuneration, neither have any of my expenses been paid. A more heartless decision on the part of a public body it is hard to conceive.

It is under such conditions and expectations as these that the competing architect has now to look forward, as this state of affairs is brought forcibly to one's notice almost every week, and I continually hear from my professional brethren such remarks as, "I don't think I shall compete—it is hard to tell if it be a genuine competition;" "I expect it is all cut and dried"; "It will be hard work and good money thrown away, perhaps, if it be not a fair competition."

It passes my comprehension why our Institute does not take up strongly this matter and much dissatisfied question of competitions. It is certainly high time something was done.—I am, &c.,

Cecil A. Sharp.

59, Fenchurch-street, E.C.

CHIPS.

About 800 men are affected by the dispute in the Scotch furniture trade. It is understood that about 100 men have left the district and obtained employment in England. No steps have yet been taken to reopen negotiations.

In the Manx Legislative Council on Tuesday, Lord Henniker handed over the picture of the Queen which her Majesty has presented to the Government of the island. The picture, which has been signed by her Majesty, was painted by Von Angeli. It is inclosed in a massive frame surmounted by a crown, and is hung in the Council Chamber.

The old mansion at Winchester, known as the Abbey House, is to be altered, added to, and rebuilt, so as to accommodate the Museum, Library and Reading-room, Art Gallery, and Reference Library, and thus free a large area in the Guildhall for municipal business. The council on Thursday empowered a committee to prepare a report and plans.

Considerable progress has recently been made with the museum which is being formed in connection with the School of Hygiene at University College, Liverpool, and it will be formally opened by the Lord Mayor during the first week in May. The work of well-known firms in Liverpool, London, Manchester, Leeds, and Leigh is represented, many of the specimens having been presented.

The new organ at New-road Congregational Church, Bury, Lancs, erected by Messrs. Lewis and Company, organ builders, of Brixton, London, was opened yesterday (Thursday). It is built on the tubular pneumatic principle; and the bellows will be blown by a Ross valve engine (hydraulic). The organ contains three manuals and pedals and 32 stops in all. The whole of the metal-work is of spotted metal.

A turret quarter-chime clock has been erected in the tower of the Wesleyan chapel, Long Preston, near Skipton, and two bells, to commemorate the Diamond Jubilee, which was set going on Good Friday. Messrs. W. Potts and Sons, Leeds, are the makers.

A new chapel is to be erected by the New Connexion Society at St. Ives, Cornwall. It is to have a spire of 82ft. high, and the edifice will accommodate 450 people in the main body, and 100 in a gallery placed over the entrance lobby. In addition to this there are to be minister's and choir vestries, with adjoining school buildings, classrooms, lavatory, &c. The estimated outlay is £3,500, and the work is to be completed by May next year. Mr. J. W. Firth, of Oldham, is the architect, and Mr. J. R. Saudry, of St. Ives, the builder.

Intercommunication.

QUESTIONS.

[11933.]—**Adjoining Owner.**—Two building sites adjoin. On one a residence has been erected and let to a tenant. The owner of both properties is now desirous of building on the other site, close up to the boundary; but his tenant objects to allow any scaffolding being erected on the first site to enable his landlord to carry up the outside wall of residence to be built on other site which abuts, and has further given notice of objecting to any slung or overhanging scaffolding being used, which is absolutely necessary to carry out the work. Would the owner run any risk should he go on with the work either by erecting scaffolding on the first site, or, supposing he could not do this, would he be running any risk if he used a slung or overhead scaffolding to enable him to carry out his proposed work? Being the owner of both properties, he feels it hard upon him by his having let one that he should be prevented from building his house on the second site, but would risk a lawsuit if he felt he was within his rights in going on with the work.—Royston.

REPLIES.

[11924.]—**Terracotta Work.**—Several well-known firms, such as J. C. Edwards, of Ruabon, and other firms, supply excellent terracotta. The smaller the blocks, in reason, the better, and they should not exceed 3ft. cube. The larger the block, the more difficult it is to insure straight arrises and true lines. The joint should be rather fine, but not too close, or the terracotta is apt to flush. For filling the blocks, Roman is less likely to burst the block than Portland cement; lime concrete is often used with good results.—G. H. G.

[11929.]—**Useful Items.**—I know no way of using bees-wax in the manner asked; but "N." can dissolve paraffin-wax in benzine, placing the wax in the benzine in a cup, and the latter in a larger cup or basin of boiling water. You can then apply the melted wax or benzine as a capital waterproofing solution to cloth or canvas. Applied to the inside of an umbrella, it will make it outlast three.—Jabez.

[11930.]—**Brick Ornament.**—It will be better to set the bricks in position in the building, and carve *in situ*.—H. L.

[11931.]—**Plumbing Fittings.**—"Learner" does not state whether he is an architect or a plumber; but if the latter, he will learn all such matters by experience. There are good books on plumbers' work by Messrs. Buchan, Hellyer, and Clarke, respectively.—H. L.

[11932.]—**Photography for Architects.**—There are good elementary books on photography, such as Burton's "Modern Photography," Henry's "Early Work in Photography"; while, for the application of the art to architecture, there is a book called Mill's "Photography for Architects," and the best book on the subject "Architectural Photography," by G. A. T. Middleton. The latter is really good and very cheap.—Henry Lovegrove.

[11932.]—**Photography for Architects.**—"Everyone's Guide to Photography," by E. J. Wall, F.R.P.S., will be found very useful for obtaining a knowledge of the development of plates, toning, &c. I should recommend a ¼-plate camera, as ½-plate is too small for architectural detail, and whole-plate is too cumbersome for cycling and rambling. If only one lens is used, a wide-angle Rapid Rectilinear is to be preferred.—Cyril Dyson.

[11932.]—**Photography for Architects.**—A book on the subject "T. F. M." writes about has just been published by Hazell, Watson, and Viney, Ltd., on "Architectural Photography," by G. A. T. Middleton, A.R.I.B.A., which will give practical lessons for the amateur, and is moderate in price.—G. W.

David Holland, 63 years of age, a clerk in the employment of the Manchester corporation, was charged before the magistrates of that city on Tuesday with conspiring with John Tetlow, said to be connected with a firm of earthenware pipe manufacturers, who is already in custody, to obtain from the corporation the sum of £56 18s. by means of false pretences, and also with conspiring to obtain £5,000 from the corporation during the past 10 years. He was remanded till Monday next, bail being granted. It was stated that the prisoner had been in the employ of the corporation for 22 years, recently in the highways department, and formerly under the city surveyor.

In 1894 the Rev. G. T. Braiué-Hartnell, then vicar of Liskeard, died. As a tribute to his memory a large mural brass affixed to a black marble slab has been placed in the chancel of the parish church. The edifice is being further enriched by a second carved parclose screen of oak being placed on the north side of the chancel.

At the last meeting of the Dublin Corporation a report of a deputation which recently visited several large English centres was adopted with reference to the fire brigade, and, as a result, several improvements are to be taken in hand. A large central station is to be erected as near O'Connell Bridge as possible, and there are also to be four sub-stations in various parts of the city. A system of electric street alarms is to be provided, and horizontal fire escapes are also to be introduced, as, owing to the overhead wires of the electric tram system, there will in future be difficulty in manipulating the vertical escapes in the leading thoroughfares. It was decided to borrow £20,000 to procure new electric cables and erect four sub-transformer stations in connection with the existing installations.

LEGAL INTELLIGENCE.

Direct Communication between Streets.—Woodham v. London County Council.—Judgment has been given in this appeal by Mr. Justice Day and Mr. Justice Phillimore. The plaintiff desired to make a new road at Catford, running from Lale-ham-road, and after some distance turning at right angles, and communicating with Brownhill-road. By section 9, subsection 4, of the London Building Act, 1894, it is provided that it shall be lawful for the London County Council to refuse to sanction the formation of a street where the street is proposed to be formed or laid out in such a manner that it will not afford direct communication between two existing streets. The county council held that the street proposed to be formed must be a straight street communication between two existing streets, and so refused to sanction the plaintiff's undertaking. The plaintiff thereupon appealed to the tribunal of appeal constituted under section 175 of the same Act, and that body upheld the opinion of the county council. An order was then made by the judge in chambers for a special case under section 182 of the Act to be stated, for the purpose of determining any question of law arising on the case in question. Mr. R. M. Bray, Q.C., for the plaintiff, submitted that the meaning of the words "direct communication between two streets" was a question of law for their lordships' interpretation, and that the proposed new street was a direct communication, although it was not a straight road. He cited "London County Council v. Edmonson" (66 *L.T.*, N.S., 200). Mr. Horace Avory (for the London County Council) contended that the question raised was essentially one of fact to be dealt with by the Council. The tribunal of appeal had been constituted for safeguarding landowners wishing to lay out their land and for deciding questions of fact. The matter had been before both these bodies, and they had exercised their discretion. Mr. Justice Day: I am of opinion that this is a question of fact, on which both the London County Council and the tribunal of appeal have pronounced their opinion, and I see no reason to differ from them. Mr. Justice Phillimore: I quite agree. I think the words "direct communication" are a matter for the County Council, and we cannot interfere. The appeal was therefore dismissed.

CHIPS.

In the list of adjudications in bankruptcy, published in Tuesday's *London Gazette*, the name appears of Richard Arthur Bullivant, of Leeds, architect and builder.

Sir Wyke Bayliss, P.R.B.A., will deliver an address to-morrow (Saturday) at the galleries of the Royal Society of British Artists, Suffolk-street, on "Art in the House of Her Friends." The lecture, which will be addressed to members and friends of the society, will be delivered at 4 p.m.

A new altar table has been given to the parish church of St. Cuthbert, Lytham. The altar is of oak, carved in Gothic panels, in keeping with the design of the reredos, and is the work of Messrs. Jones and Willis, of Birmingham. It will bear a plate to the effect that it is a memorial gift, and was dedicated on Saturday afternoon.

Subscriptions continue to flow in from all parts of the country towards the fund for the restoration of the ancient cathedral at Brechin, N.B. The fund is managed by a large committee, and the sum aimed at is £10,000. The amount received up to the end of March was slightly over £5,100, so that fully one-half of the total has now been collected.

The conversion of the plot of land in close proximity to the Waterfall Gardens and the railway at Truro into a public park, as a memorial of the Diamond Jubilee, is rapidly approaching completion. Messrs. Henderson and Son, civil engineers, whose plans were chosen, also secured the contract for the work.

The Marquis of Ripon, K.G., performed on Monday the opening ceremony in connection with new Roman Catholic schools in St. Mary's parish, Bradford. The buildings are situated in Stott-hill, and occupy the site of an erection which was formerly used as St. Mary's church, and afterwards as day-schools. The new premises will accommodate 1,115 children—622 girls and 493 infants—and there are also clubrooms.

The discovery has been made at Blyth, near Retford, that the hill on which is situated the village school and the Green is really a barrow, or artificial mound, used as a place of interment for pre-historic races. During the removal of the foundations of a row of cottages on the Green, skulls and other bones were found, including a neolithic human skull and the bones of a horse. These were found in cists, made of a large number of small stones, and having a vaulted appearance. Last week a bored pebble was found on the hill. It was of an ordinary quartzite boulder, bored on each side by human agency, and having the shape of an axe.

Our Office Table.

Mr. Charles Lock Eastlake, F.R.I.B.A., having reached the age limit, has retired from the post of keeper of the National Gallery and secretary and accounting officer to the trustees, and the Treasury has appointed Mr. Hawes H. Turner to that office. Mr. Eastlake was educated as an architect, and preceded the late Mr. W. H. White as secretary to the Royal Institute of British Architects. About twenty years ago he obtained the office he now vacates; since then to him have been committed the detailed management of the Gallery, the correspondence not requiring the direct authority of the trustees and directors, and the hanging of pictures. Some years since he contributed a series of articles to our columns on "'Old Masters' at the National Gallery and on the Continent." The trustees and director of the National Gallery have passed a resolution respecting the recent retirement of Mr. Eastlake. They regret that Mr. Eastlake is obliged, under the regulations of the Civil Service, to retire from his duties, and express their thanks for the efficient manner in which he has discharged those duties during the twenty years of his services as keeper and secretary of the Gallery.

The annual exhibition of work by the art students at the Technical School, under the control of the Technical Education Board of the London County Council, was opened on Wednesday in one of the large rooms of the building in Bolt-court, Fleet-street. The collection of exhibits includes specimens of drawing from the life and from the cast, and also drawing as applied to "process." At the present time there are about 200 lads and young men receiving regular instruction either in the art or technical department of the school, all of whom are genuinely engaged in some branch of the photo-mechanical, photographic, designing, lithographic, engraving, and printing crafts. The exhibition, to which admission is free, will remain open till to-morrow (Saturday) evening.

A new factory which Messrs. Hall and Fenton, of St. James's-row, Sheffield, have designed for Messrs. Walker and Hall, to be erected on a portion of the site of their present establishment in Howard-street, will be a unique object in the architecture of that city. It is to consist of nine floors, and a flat roof protected with a parapet of ornamental ironwork, upon which, at an elevation of more than 100ft., it will be possible to take the air and obtain a bird's-eye view of Sheffield. Thus it will be the highest building devoted to commerce in the city. As the ground dimensions are only 80ft. by 26ft., the place will present the appearance of an oblong tower. The factory will be faced throughout with white glazed bricks, the beams and joists are to be of steel, and the floors of concrete. The new building will provide accommodation for upwards of 700 workmen, who will ascend to their shops by the means of an elevator.

The maximum height to which buildings may be lawfully carried in Chicago has just been reduced from 155ft., the former limit, to 130ft. This will, under ordinary circumstances, give room for ten stories, in place of the twelve stories which could be put into 155ft. The present limit in Boston is 125ft., which admits ten rather low stories as against the statutory 90ft. of the new London Building Act. Recently, a bill was introduced into the State Legislature for reducing the limit to 100ft., by a general law, applying to the whole State of Massachusetts; but it failed to meet the approval of the committee to which it was referred, and it is probable that nothing more will be heard of it. As 125ft. will only with difficulty admit ten stories, 100ft. would allow, under the heights of rooms permissible in Massachusetts, only seven, which would occupy, in ordinary mercantile buildings and hotels, about 92ft., leaving a waste space of 8ft., too low for an additional story, and unnecessary for roof-space.

The Sun Life Assurance Society's report and accounts for the year ending 31st December last abundantly justify the opinion we have always expressed of the position of this admirably managed company. The following are the salient points:—2,329 new "life" policies were issued, assuring £1,092,382, after deduction of re-assurances, with premiums £43,939. The "life" premium income was £419,986, and interest, dividends, and rents produced £135,026; the average rate of interest being £4 4s. 3d. per cent. The total "life" income amounted to £555,221. Claims were well within the expectation, and amounted to £235,224, including bonus additions; cash bonuses to policy holders to £91,534. Surrenders were £20,855, and commission and expenses of management, including expenses of valuation and distribution of bonus, £69,057. These, with smaller items, made the total "life" outgo £472,520. Annuities were granted during the year for £6,789, the consideration money received being £55,217. The total funds have been raised in the year from £3,672,755 to £3,957,198, being an increase of £284,443. An accident and general department has been established for the transaction of personal accident, employers' liability and workmen's compensation insurance, which many readers will find advantageous.

Mr. Adam Teacher, proprietor of several licensed houses, who died at Glasgow last week, has left £50,000 to local charities, and has bequeathed all his pictures to the Glasgow Corporation.

A portrait of Sir Arthur Arnold is being painted, by subscription of members of the London County Council, to be placed in the County Hall, Spring-gardens.

New county schools are about to be erected at Mold. Mr. Thomas Roberts, of New-street, Mold, is the contractor, and Mr. Edward Bradshaw, of Denbigh, is the clerk of works.

At the last meeting of the Kilmarnock Town Council Provost Mackay intimated that offers for the erection of the museum, towards which Mr. Dick, of Glasgow, had gifted £8,000, amounted to £11,176, and that Mr. Dick had increased his gift to that amount rather than that the plans should be interfered with.

A memorial stained-glass window has been placed in St. Luke's, Bolton. It is one of a series, illustrating the Te Deum. The figures are of St. Aidan and St. Cuthbert, two of the earliest missionaries to Northumbria.

St. Mary's Church at Evedon, near Sleaford, was reopened, after restoration and enlargement, on Tuesday. New stained-glass windows have been inserted at the east and west ends, the old boxes replaced by handsome oak seats, and the whole of the interior remodelled and restored. The work has been done at a cost of £500. It is hoped in the near future to procure a better organ and rehang the bells.

On Palm Sunday the Bishop of St. Asaph dedicated a stained-glass window in Whitford parish church, Flintshire, in memory of the late Lord and Lady Mostyn. The window is an east light on the Mostyn side of the church. It contains four subjects, representing "The Adoration of the Wise Men," "Our Lord's Presentation in the Temple," "Our Lord's Subjection to His Parents," and "The Carpenter's Shop."

Bradford old Parish Church is in the hands of the restorers, and is being thoroughly overhauled and made presentable in view of the opening of the Church Congress in that town in the autumn. Galleries and pews have been removed, and the stone walls relieved of plaster.

The first annual meeting of the West of England and South Wales Federation of Master Builders will be held at Bath on the 3rd May, and the newly-formed Bristol Cabinet Federation will hold its annual dinner on the 7th proximo.

Up to the present the expenditure on Wentwood Waterworks at Llanvaches, Mon., by the Newport Corporation, has been £113,930. The work is being proceeded with rapidly, over 200 men being engaged.

A service was held at Tewkesbury Abbey on Tuesday to dedicate a coloured-glass window, which has been erected to the memory of the late Mr. B. T. Moore, who for 38 years was warden of the abbey. The window is in St. Faith's Chapel, in the ambulatory, and represents St. Faith in the centre light and St. Cecilia and St. Agnes in either of the side-lights, the figures being three-quarter length.

A chancel screen, erected in the church of St. John the Baptist, Atherton, was dedicated on Palm Sunday. It has been designed to take the place of the low stone screen wall which ran across the entrance of the chancel. It is of oak, 26ft. wide and 16ft. high, and stands on a stone base 12in. deep. It is seven bays wide, the centre bay 5ft. wide, and that on the extreme north forming the entrance to the pulpit. The lower portion is solid panelled, with carved linen panels, the head of the screen being filled in with carved tracery panels. From the caps of the shafts on the west side of the screen next the nave springs a groined canopied ceiling, which supports the cornice. The screen has been designed and superintended by the architects of the church, Messrs. Austin and Paley, of Lancaster.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Society of Arts. "Indiarubber," Cantor Lecture No. 1, by Dr. D. Morris, C.M.G. 8 p.m.
Royal Institute of British Architects. "Domestic Architecture in the United States," by A. N. Paterson, M.A. 8 p.m
Liverpool Architectural Society. Jubilee Dinner, at Walker Art Gallery.

Tuesday.—Institution of Civil Engineers. Discussion on "The Electricity Supply of London." 8 p.m.

Wednesday.—Surveyors' Institution. Meeting at Manchester. (1) "Manchester from 1847 to 1897," by John Holden, of Manchester; (2) "Lessons from Fire and Panic," by T. Blashill, Superintending Architect London County Council; (3) "A Consideration of some of the Present-day Difficulties met with in a Land Agent's Practice," by C. P. Hall; and (4) "Notes on the Construction of Town Buildings," by Howard Chatfeild Clarke. Town Hall. 11 a.m.
Society of Arts. "Stage Mechanism," by Edwin O. Sachs. 8 p.m.
Edinburgh Architectural Society. "Sculpture in Relation to Architecture," by T. Duncan Rhind, A.R.I.B.A. 8 p.m.

Thursday.—Society of Architects. Annual Dinner. St. James's Hall, Piccadilly, W. 6.30 for 7 p.m.
Society of Arts. "Recent Railway Policy in India," by Horace Bell, M.Inst.C.E. 4.30 p.m.

Friday.—Architectural Associat on. "The Morality and Economy of Competitions," by H. B Cresswell. 7.30 p.m.

THE ARCHITECTURAL ASSOCIATION.

APRIL 22nd, ORDINARY GENERAL MEETING, No. 9, Conduit-street, W., 7.30 p.m. Mr. H. B. CRESSWELL on "THE MORALITY AND ECONOMY OF COMPETITIONS."

E. HOWLEY SIM
G. B. CARVILL } Hon. Secs.

CHIPS.

The Lycett Wesleyan Memorial Chapel, in the Mile End-road, was partially destroyed by fire on Wednesday in last week.

The urban district council of Sevenoaks have raised the salary of their surveyor to £276 per annum.

The members of the Edinburgh Architectural Society met on the 6th inst. (Mr. W. N. Cumming, A.R.I.B.A., in the chair), when a lecture was given by Mr. John Kennedy on "Building Stones: their Preparation and Use." The lecturer insisted on the necessity of architects knowing more about the stones they employed, and described and classified building stones, their various dressings, and their apecial purposes.

It is stated that Mr. J. Passmore Edwards will lay the foundation-stone of the Public Library, Launceston, in May.

The Bayham Abbey Ruins, near Tunbridge Wells, will for some time to come be closed to the public, in consequence of the dangerous state of some of the old walls. The Marquis Camden has been advised, for the safety of the public, to close the grounds until such renovation as is permissible can be made.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied some more of their patent Manchester grates to the Royal Infirmary, Wigan.

With the object of celebrating the jubilee of the Liverpool Architectural Society, the president and council of the body have issued invitations for a banquet on the evening of Monday next, the 18th inst., which, by permission of the corporation committee controlling the Walker Gallery in the city, will be held in one of the rooms of the Spring Exhibition.

Plans have been approved by the Hornsey Urban District Council for the drainage, fencing, and laying-out of Churchyard Bottom Wood, Highgate, which has just been secured for the use of the public. It is proposed to interfere as little as possible with the present features of the wood, but a lodge will be erected and a park-keeper engaged to reside there permanently.

The town council of Tunbridge Wells have purchased a small estate, on which they propose to erect dwellings for the working class. The borough surveyor has been instructed to prepare plans and estimates for roads, sewers, fences, &c., for the land acquired; and also for 10 two-roomed houses, 40 four-roomed houses, 30 five-roomed houses, and 20 six-roomed houses.

The Wallasey Urban District Council have adopted a scheme of the works committee for purchasing land to widen Rowson-street, New Brighton, in view of probable tramway extension there. The council have also approved the purchase of Liscard Vale and College, containing about 33,700 square yards of land, as a public park, at a cost of £7,750.

Trade News.

WAGES MOVEMENTS.

Arbroath.—The strike of the Arbroath joiners, which had lasted about a week, came to an end on Thursday in last week. The masters have given in to the demands of the men, and signed the by-laws. Under the new arrangement, wages will be paid at the rate of time and a quarter for work done after a day of eight hours during winter, and an additional 1s. will also be paid for work done in the country district. Work has been resumed.

Fareham, Hants.—The builders' employees have applied for a rise of 1d. per hour all round, to take effect on May 2.

Leeds.—The men in the Leeds building trades lately gave notice for an advance of wages. The masons, who asked for ½d. per hour advance, have had their demand granted, their request for overtime being withdrawn. The plasterers asked for 1d. per hour advance, and the masters offer ½d., which has not yet been accepted. The joiners demand ½d. per hour advance.

Newport, Mon.—The Newport branch of the Amalgamated Society of Carpenters and Joiners have refused the masters' request to withdraw the ban on a certain "shop," and the masters' association have therefore locked out the men. About 200 men are affected.

Scarborough.—The plumbers of this town struck work last April for an increase in their wages from 7½d. to 8½d. per hour, and after an interval of about four weeks the men recommenced work at 8d. per hour. It was then agreed that the number of operative plumbers working in the town on April 3, 1897, be stated and verified, and that if the same number continued at work on April 3, 1893, the wages be advanced to 8½d. per hour. It has now transpired that the number of operatives engaged in the town on the latter date was eight less, and so the wages will remain at 8d. per hour.

Mr. W. O. E. Meade-King, Local Government Board inspector, attended at the Court House, Stowmarket, Suffolk, on Wednesday week, to hold an inquiry as to the application of the Stowmarket Rural District Council and the East Stow Rural District Council for the sanction to the borrowing of £5,100 for a joint scheme for sewerage and sewage disposal.

An addition is about to be made to St. Matthew's Church, Weststown, by the erection of a memorial chapel. The structure will be placed on the south side of the chancel, and will be entered from the corresponding aisle of the nave. The present sitting accommodation in the church is for 575 worshippers, and is insufficient. The chapel will correspond in style with the architecture of the church.

A new senior public school and secondary department of the West Calder School Board were opened last week. The school is estimated to cost £4,900, and has accommodation for 450 scholars, including a secondary education department.

Liskeard and Looe Railway has been purchased by a company in London, who will immediately construct a new line from Looe to connect it with the Great Western Railway at Liskeard station. Mr. J. C. Lang has secured the contract, and will commence operations almost at once.

An external pulpit of atone is being built at St. Martin's Church, Birmingham, in the angle of the tower buttresses.

The Countess of Rosse, Womersley Hall, has given a new quarter-chime clock to Womersley Parish Church, which was set going by her Ladyship on Saturday noon. The clock was made and fixed by Messrs. William Potts and Sons, of Guildford-street, Leeds.

The rural district council of Keynsham have adopted plans by Mr. Bennett, C.E., for the sewerage of Keynsham, at an estimated cost of £14,000.

The Local Government Board have refused to sanction the application of the Peterborough Town Council for a loan of £30,000 for electric lighting in the city.

The amended estimates for the total cost of the Greenwich tunnel, including land, compensation, and works, amount to £155,150. In February last tenders for the work were invited from six selected firms. Two tenders only were received—one from Messrs. Mowlem and Co. amounting to £119,732, and the other from Messrs. Pearson and Son amounting to £155,000. As the expenditure provided for under the Act obtained by the London County Council authorising the introduction of the tunnel is only £70,500, the Council is taking steps to obtain Parliamentary sanction for the additional outlay, and in the mean time the acceptance of tenders is postponed.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2259.
FRIDAY, APRIL 22, 1898.

CLOTHING IDEAS.

SOME time ago an advertisement in a journal devoted to literature ran as follows:—"The advertiser wants a literary amateur to put his ideas into fluent and stylish English." There are hundreds of men who have ideas which they cannot utilise or turn to account. One thing they want is the art of "licking them into shape," of expressing them in readable language. Hundreds of people would add to the ranks of fiction writers and novelists, or would write books on science or art if they only possessed the gift of expressing themselves with fluency. And it is exactly the same in other fields. We find men who have inventive minds stranded because their education has not allowed them to turn their invention to the best account, or because their project is not new, after all. They are not mechanician, mathematician, or chemist enough to have discovered where they have failed. There are also manufacturers who have brought out really good things, but have not been fortunate enough to present them in the best form. We could name manufacturers of materials like brick, terracotta, faïence, inventors of appliances like ventilators, who have failed to set forth their work in a favourable light. They are contented with indifferent or positively objectionable designs; their mouldings or ornamental details are poor—often out of date or extremely showy. These are certainly drawbacks to many of our manufactured goods. Capital, machinery, industry, appliances, all that can assist the turn-out are in every way admirable; but the one thing that is wanting is the art sense. We are able to manufacture anything, says the enterprising tradesman, that the architect can ask for, but his requirements come too late, and the firm make their own designs; often they engage competent artists to do their work, and it is done well. The said artist is in touch with the manufacturer or craftsmen; he gets familiar with the material, with its requirements and limitations, and his work ought to be satisfactory. But the popular demand for ornament is often too great even to resist. Do we not find this especially so in ironmongery, grates, chimney-pieces, and furniture?

If we turn to the architect's work, we have to acknowledge that the advertised for "clother of ideas" is quite as much in evidence. The successful planner of workhouses, hospitals, or baths owes much of his success to the artistic draughtsman. He is perhaps the "ghost" in all but name; his existence may be more sedulously obscured as the manifestation of his genius becomes clearer. The man who can write fluent English and put a crude idea into shape, or describe a plot in winning phrase, often shares the honour of the work, even if he is only giving expression to the invention of another, so also the clever draughtsman who gives interest and colour to a very commonplace building deserves to be recognised, at least, as joint author of the design. After all, the man who can clothe in agreeable architecture a clever or well-adapted plan has a claim to be recognised. Pugin's taste and skill in Gothic detail is even now acknowledged when we look at and admire the splendid pile which fringes our riverside at Westminster. It required undoubted ability to plan so complex a building as a House for the Legislature of a great nation; but must we not also acknowledge the architectural skill which we see in the grouping of parts, and the refined Tudor details of the wonderful but over-wrought façade. The outward dress is, or ought to be, the correlative of good plan. In the architectural profession we are constantly reminded of the existence of these two functions, almost distinct and separate, yet depending on each other. They seem sometimes to unite and combine in the same individual, but more often they are almost irreconcilable, as some of our more important public buildings testify; and it is this dual nature of modern architectural practice—we cannot say that it was always so—that has set the face of Parliament against a public competition for the proposed new Government Buildings. The authorities ask for an artist who can clothe their own buildings. The experience of Government officials and others has been that a public competition draws out both sides of architecture—men who can plan good offices but who cannot design buildings worthy of the country, and men, on the other side, skilled as artists, who have no knowledge of practical requirements. Between these two classes our national architecture has suffered. We look to other nations like France and Belgium for models of union between the useful and the artistic. Such being the belief, the popular idea is, Get a practical man to draw the plans and superintend the work, and employ an architect to clothe his building in appropriate habiliments. Nothing easier to the ordinary man; but has it ever been crowned with success? Have we not several buildings in London and the provincial towns illustrating the impracticability of the coalition?—of pinched and parsimonious interiors clothed with tawdry finery outside, or a result in which the co-operation has been anything but cordial when the official architect and the art designer or clothier have not been on the best of terms, the latter attempting to disguise rather than express the plan? And will any future Government buildings carried out on this system of divided authority show better results? The Whitehall buildings which have been so criticised by Sir W. Harcourt and Sir Henry Campbell-Bannerman are instances of clothed buildings of this description. They are conspicuous instances of buildings in which official ideas have been clothed to suit the style of the day. We have no proof that these separate functions have given success, or that division of labour in the design has been worthy of the effort. Open competition has presumably failed because favouritism or party influence has been in the ascendant. A competition conducted on a proper basis, and in accordance with more recent experiences and safeguards, is more likely to produce a combination of good arrangement and design. It has failed hitherto because the right methods have not been followed. Large premiums have been offered to the profession for "designs," without any reference to actual requirements, and crude ideas clothed in attractive garments have been sent in. We have here a contest appealing to the mere getter-up of architectural designs, where the expert artist has the better chance. The consequence is that a well thought out design is in the minority. But this condition of things no longer prevails. Under a properly prepared set of conditions with efficient assessors, two or three at the least, it is possible to obtain an amalgamation of the desired qualities—plan and elevation. The tricky perspective has less chance of winning than it had formerly, and more attention is given to plan. Separation in architecture—by which we mean the engagement of two individuals, one as builder the other as "artist"—is wrong in principle, and based on the idea that plan and external expression are different duties, and modern practice has sanctioned the fallacy. Public official architecture worthy of the age is not likely to be obtained in the way proposed.

MODEL SPECIFICATIONS.—IX.

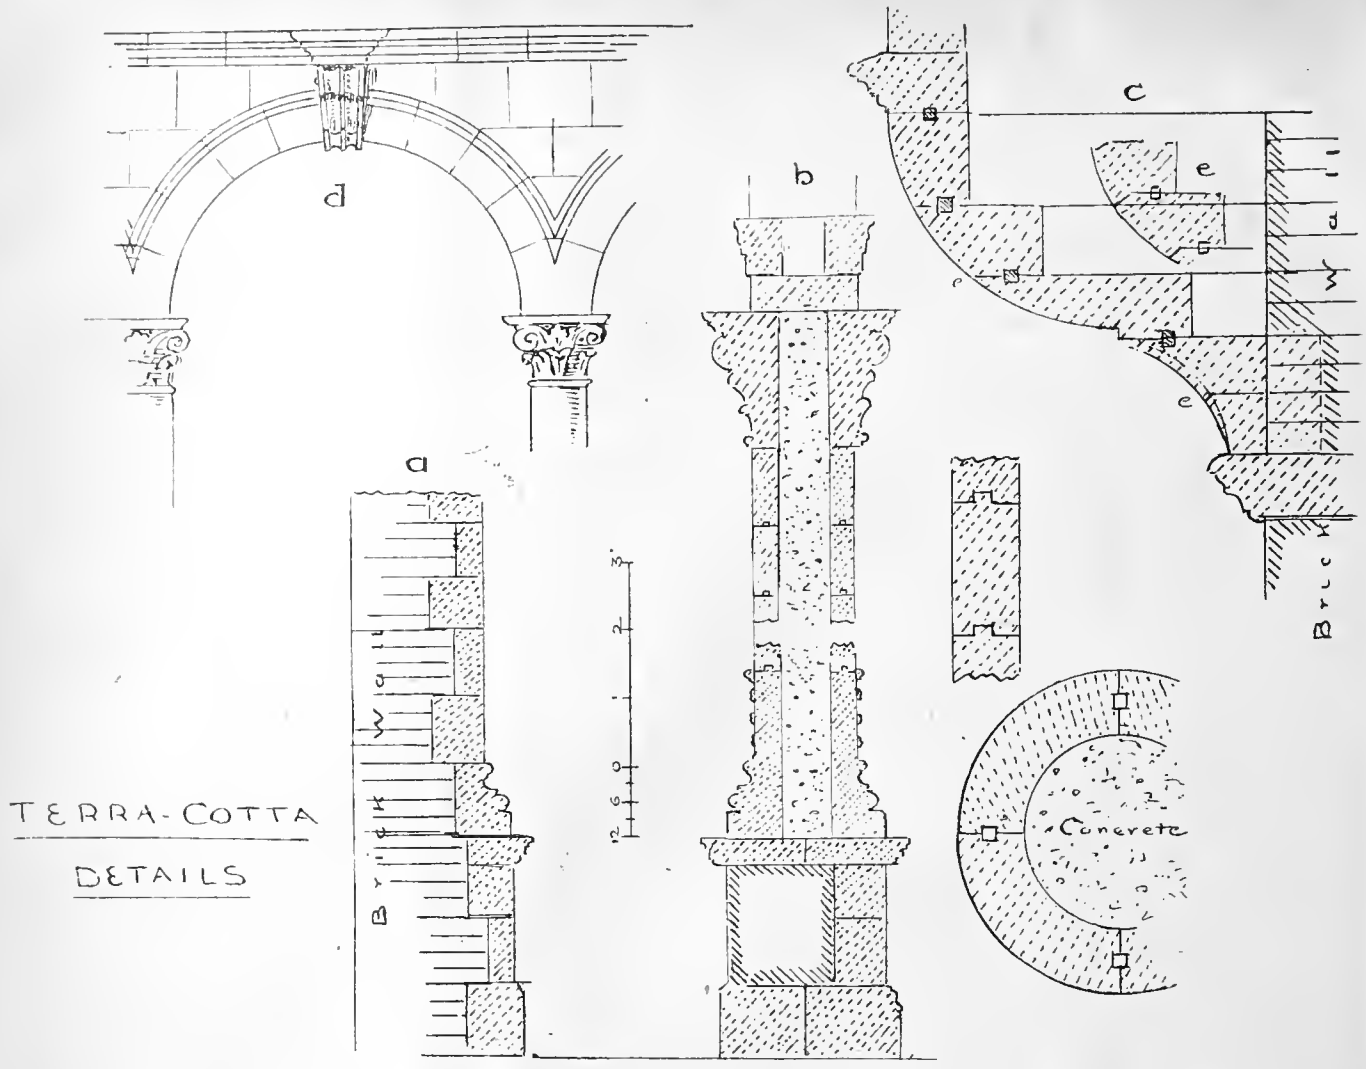
TERRACOTTA.

BY an almost natural transition, we pass from brickwork to terracotta. The illustrative designs we have given for brickwork may, with few exceptions, be produced in terracotta. So we shall only add examples of the application. Of course, there are limitations, such as coursing with brickwork, in facing brick walls, dimensions of blocks, &c. Great projections should be avoided; but, generally speaking, any design that can be executed in brick or stone may be made in this material, though it is not advisable to imitate stonework. The sketches we give comprise ornamental window-sills that can be made or moulded in terracotta, as in the case of the corbelling for oriel windows, Fig. 3, one-half of which is shown in cut and gauged brickwork. Fig. 5 is a good example of a terracotta set of base or plinth mouldings for an arcade, though suitable also for stone. We also show examples of terracotta dormers or gables and door-heads.

It may be desirable to remark that the clay most suitable for the production of brick or terracotta is that which contains a silica and alumina in the proportion of about 60 to 65 parts of silica to 20 or 25 parts of alumina with a small percentage of potash and soda, and the remaining material ferruginous oxides. This kind of clay has been found in North Wales, as in the Ruabon district, at Tamworth, Staffordshire, Poole, in Dorsetshire, and other places. The colour is imparted by the oxides. The amount of shrinkage in clays is the most essential point for the architect if he wishes his designs to come out true in shape; hence he should be particular to select a clay that will not twist and warp when exposed to a great heat. With inferior clays sand, broken pottery, and glass are often mixed to reduce the shrinkage, owing to the large amount of moisture in the clay. If he desires also a good natural colour, he will be particular to require that no "dipping" with clay or artificial colouring is resorted to, which will last no time. Only with the clay can the artist's intentions be realised, and the modelling and colour be retained in the "fired" product. A clause to this effect should be used:—"The terracotta is to be well burnt, made from suitable clays, containing a due proportion of silica and oxides."

TERRACOTTA WORKER.

A few notes on this material may be useful. It is necessary to use caution in the employment of terracotta: it should not be subjected to considerable weight, as it is liable to crack. To avoid this risk as far as possible, the specification should insist that all blocks of the material be carefully set and the hollows filled up solid with cement or fine lime concrete in building up in the walls. The unequal shrinkage of terracotta ought to be borne in mind in designing the pieces to be burned. The blocks should average 1ft. 6in. to 3ft. cube, and the larger blocks made hollow should have a division or diaphragm to strengthen the sides; the thickness of shell not being less than 1½in., though 2in. is better. As the shrinkage varies, a "shrinkage rule" is adopted, which ought to be observed by the designer or modeller. Mixed clays contract from 1-10th to 1-12th of the linear dimensions on drying and firing, and red clays contract about 1-20th. It is necessary to provide full-size or "clay drawings" for important blocks; but the usual scale adopted is ½in. to the foot, and the dimensions should be figured. When terracotta blocks and dressings are to be set in brickwork, the dimensions of the former should be some multiple of a brick, in order to bond with the brick courses. The length of blocks ought not to exceed 18in.—one terracotta manufacturer says the largest



blocks should not be more than 18in. to 2ft. cube. In designing, the idea should be to follow ashlar work. Those designs are most suitable where the terracotta work has been well thought out, and the work arranged so that small blocks and many joints are a feature. Mr. Waterhouse allows wide joints, so as to produce equal settlement. These should be weathered, to throw off the water. Specification should state whether the blocks are to be chambered, if filled in before or after fixing with lime or Portland cement concrete, and the kind and colour of mortar. Shrinkage is prevented by pressing so as to insure uniform thickness of clay, and special care is necessary to dry well before firing, so as to obtain evenness of line and uniform colour. For lintels and arches joggled joints are often used.

Where repetitions of the same ornament or detail occur, terracotta offers advantages and is less costly than stone. We now give a few clauses of a general kind.

1. *Terracotta.*—The terracotta to be red (or stone colour), to be carefully modelled and moulded in accordance with the full-sized or detail drawings, allowing for shrinkage.

The pieces to be thoroughly burned, of uniform tint, free from cracks and other defects, the pieces, especially those of moulded plinths, string-courses, cornices, pilasters, &c., to have sharp arrises, and true in line. No cutting, filing, or rubbing is to be done after the firing. The blocks are to have "pockets" or hollows, and be filled with fine lime concrete (or breeze concrete) composed of one part Portland cement to four parts clean coke breeze—after being soaked in water, and to be bedded in Portland cement.

The joints to be not more than $\frac{3}{16}$in. or $\frac{1}{4}$in. thick, and pointed with coloured Portland cement.

Mr. Leaning gives the following general clause:—

The terracotta shall be red, of the best quality, well burnt, and of even colour, and where hollow no part to be less than 2in. thick. None of the surfaces shall be coloured by an applied wash; none of the original surfaces to be filed, rubbed, or chipped unless they are concealed, and these surfaces are to be as little interfered with as may be. The hollows of the terracotta to be filled in with fine lime concrete, and the blocks to be previously soaked in water. No piece of terracotta shall, unless specially ordered, exceed 18in. cube. The terracotta shall be set in fine mortar, neatly pointed as the work proceeds, and cleaned down at completion. It shall be thoroughly bonded with and course with the brickwork, and no joint shall exceed a quarter of an inch in thickness. All the vertical and horizontal arrises to be left exactly true and regular. The whole to be set in mortar to match the facings, and pointed in a similar manner.

2. *Setting Out Work.*—The manufacturer (or contractor) to be responsible for the setting-out of all the terracotta work, and for the accuracy and size of each block; allowance to be made in every case for shrinkage. Each is to be marked for identification or arrangement in the building. No piece is to be filed or rubbed after the firing.

3. *Colour.*—The terracotta to be of uniform colour (or pleasingly blended shades of colour) of a tone approved by the architect.

4. *Facings of Terracotta.*—The brickwork to be faced with red or buff terracotta, manufactured by J. C. Edwards, Ruabon (or Doulton and Co., or the Hathern Station Brick Co.), 6in. thick, and of varying depths of from 3 to 4 courses, bonded to wall every square yard. The facing blocks to be laid on lime mortar with bevelled joints or pointed with coloured cement. The door and window dressings to be executed in well modelled moulded blocks according to details, no piece of terracotta being longer than 18in. (or 3ft. cube), the chambered blocks being filled up with fine lime (or Roman cement) concrete. The heads of windows and doors to have joggled joints as shown; the sills, cornices, pediments, and string-courses to be carefully modelled and jointed, as shown, and the arrises to be sharp and in true line. All warped, twisted, and cracked pieces will be rejected.

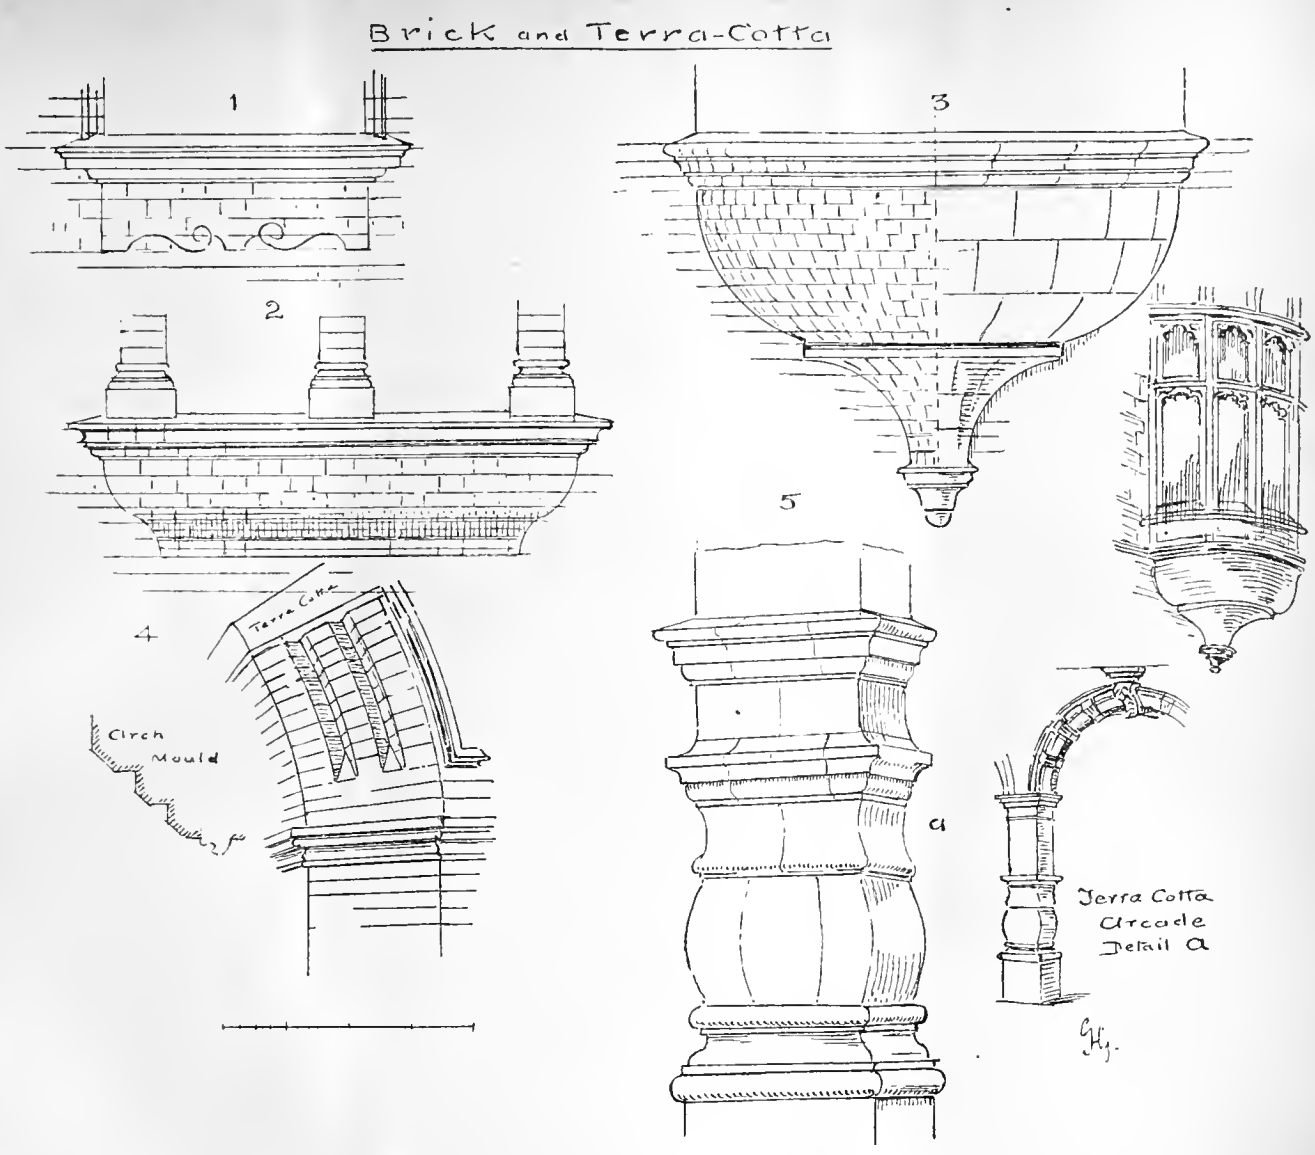
5. *General Dressings.*—The blocks for the plinths, pilasters, cornices, and window dressings to be true in line, and to be modelled according to the full-size drawings supplied to the manufacturer, who has to apply his own shrinkage scale. The blocks are to be supplied before the brickwork is commenced, so as to avoid any delay to the bricklayers engaged. The fixing to be done by the manufacturer, or under the supervision of men experienced in the material, and the blocks are to be fixed or humoured to produce straightness of line. All large blocks to be webbed, and to have the least thickness of 1½in. or 2in., and to be filled in with lime concrete.

6. *Vestibule.*—The vestibule (or loggia) to have the walls faced with terracotta in blocks, 3 (or 4) courses in height, and 4½in. (or 6in.) thick, with a bonding block 9in. deep, every superficial yard laid in lime mortar pointed with a bevelled joint. The surbase mouldings and cornices to be of blocks not to exceed 12in. (or 18in.) long, breaking joint with facing. Or—

The plinth, dado, surbase, mouldings, wall-facing, and cornice of vestibule or corridor to be constructed of terracotta according to detail *a*; the larger blocks to be formed hollow, and webbed and filled in with fine lime concrete, the whole to be properly bonded to brick wall every 3ft. in height, and jointed with lime mortar and pointed. The blocks to be made to course with the brickwork, and be of three or four courses in height.

7. *Columns.*—The columns to be built of terracotta blocks 12in. (or 15in.) high, and 4in. or 5in. in thickness, accurately moulded, with alternate bonding courses of the whole diameter. The horizontal joints to be grooved and tongued, and the vertical joints dowelled by a square hole filled with cement (or a slate dowel). The centres of columns to be filled in with broken brick grouted with cement (or the terracotta casing may surround, but not touch, a cast-iron column). The joints are to be in putty cement, ¼in. thick, laid to within ¼in. of outside face. The pointing to be done after completion. Or—

The columns (see section *b*) are to be composed of segments of terracotta, accurately modelled, without twist or warp, having tongued and grooved joints in lime putty, ⅛in. thick, with dowels of cement in the vertical joints, as shown.



The centre to be filled up as the casing proceeds with broken brick and Roman cement concrete; or the terracotta casing is to be constructed round iron columns, the space filled in with concrete or some non-conducting substance like slag wool. The bases and capitals are also to be cast hollow, made in four pieces (or if small in one hollow block). Or—

Construct the columns according to design. The terracotta to be supplied by J. C. Edwards, of Rnabon, and to be made in cyclindrical segments 3in. or 4in. thick, dowelled together, and with grooved and tongued joints, the pieces to be laid in cement mortar, and the centre cavity to be filled with fine Roman-cement concrete, levelled up as the pieces are fixed.

Most specifications are silent on constructive terracotta work. Where there is any considerable weight to carry, the column blocks would be better solid, in small pieces, bonded every other course, as in stonework, or, if hollow, the blocks should be filled up as the column is built. In most cases where this material is employed, it is for decorative purposes—such as for the columns carrying a floor on which there is no weight, for street façades, shop-fronts, in which it is used simply as a casing for iron columns or stanchions.

8. *Arches.*—The arcade (sketch *d*) to be constructed of properly radiating and moulded blocks of the size shown on details (allowance to be made for shrinkage in drying and burning), properly set out, laid in lime or cement mortar, with neat joints not to exceed $\frac{3}{16}$in. wide, pointed in coloured Portland cement. Or—

The blocks for the arcading to be accurately set out by the manufacturer (with the aid of the contractor or clerk of works) according to the working drawings, allowing for shrinkage; no chiselling or filing to be done after the firing, and to be turned to the proper curvature, jointed in cement mortar, the joints not to be more than $\frac{3}{16}$in. thick, and to be pointed in coloured cement. The capitals of columns to be cast according to design, and to be approved by the architect; also the ornamental keystones. (If the blocks are chambered, state so, and the filling of the same with concrete.)

9. *Corbelling to Oriel.*—The terracotta blocks to be accurately set out and modelled to full-size drawings, with radiating joints properly shaped and bevelled, and "pinned" into the wall. The blocks to be grooved and tongued together, and the vertical joints between each to have a slate or cement dowel. Or—

Construct with terracotta blocks in courses, moulded to curve and shaped to proper radius, the oriel corbel shown in elevation (Fig. 3). The horizontal courses to be tongued and grooved (or joggled together, section *e*), set in fine mortar, and pointed with a bevelled joint. The springer or corbel and the next course to be built or tailed into the wall to the extent of 9in. (or 14in.) in cement, and each course of blocks to be bonded into the brick wall. The sill to be covered with 5lb. lead projecting to form a drip.

The following clause is applicable to a brick oriel, "gauged" and set in putty. For heavy oriel projections, a rolled-iron joist is fixed, bearing on the side jambs of opening at a height sufficient to allow the joists to rest upon it. Under the lower flange, "tailed" into the wall, York flags may be introduced to take the upper part of corbelling and oriel, so as to form a tailing-down or counterbalance to the weight above.

10. *Brick Corbelling.*—The projecting courses of corbelling to be set out full size, each course being made to radiate from centre of semicircle, and the face of each brick cut and rubbed to the necessary curve with proper bevels. Only headers to be used, set in a neat putty joint. A terracotta or stone springer tailed into the wall to be put in below the lowest course of corbelling. The projecting string and sill courses to be of moulded bricks (see sketch), and to be covered with 5lb. lead projecting $\frac{1}{2}$in. to form a drip.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A SPECIAL business meeting of this institution was held on Monday evening at 9, Conduit-street, W., the chair being occupied by Mr. H. Louis Florence, vice-president. The resolution passed at the special meeting, held a fortnight previously, suspending By-law 26 so as to allow of the re-election of Professor Aitchison, R.A., for a third year of office as president, was duly confirmed.

The Lords of the Privy Council having raised certain objections to ambiguities of wording in the additions and amendments to By-laws 30 and 9 as resolved at the special general meetings respectively held on the 14th June and the 13th November, 1897, such additions and amendments were altered by the meeting, after consideration and some discussion, as follows:—(*a*) By-law 91: Provided always that when the Council of the Institute receive a unanimous recommendation formally submitted by the Council of any Allied Society that a practising member of the profession is eligible and worthy of being elected as a Fellow, the Council shall, *during the five years from the date of approval of this provision by the Privy Council*, have power to elect him *if in their opinion* his work be of sufficient merit. The Council *shall* also *have the power to* elect annually to the Fellowship without ballot the President or President-elect of any or all of the Allied Societies who may be eligible and apply for admission. (*b*) By-law 30: The words in the antepenultimate sentence "the said meeting" were altered to "*the close of the last General Meeting*

in June"; and in By-law 31, the last sentence, the word "first" was amended to "*last*."

An ordinary meeting of the Institute immediately followed, Mr. Florence in the chair. The presentation was announced, and acknowledged by thanks, of a framed water-colour drawing representing the stylobate of the temple of Antoninus and Faustina in the Forum at Rome. The picture was executed and given by the Chevalier Settimo Guenpietri, of Rome, a newly-elected hon. associate, and was recently exhibited at the Dudley Gallery.

DOMESTIC ARCHITECTURE IN THE EASTERN STATES OF AMERICA.

Mr. A. Nisbet Paterson, M.A., of Glasgow, the holder of the Goodwin Bursary for 1896, read a paper on this subject, illustrated by numerous plans and details, and a few water-colour sketches. The author explained that his remarks would have special reference to questions of plan, construction, heating, and drainage. He reminded his hearers that the first colonists carried with them to America not only the language, the laws, and the flag of the old country, but its architecture also. In what was known as "Old Colonial" would be found reproduced, with such modifications only as ensued from the adoption of wood instead of brick or stone, the buildings of the time of Queen Anne and the first Georges. Influenced, however, by new conditions of climate, of materials, and of class relations, and impelled by a constant and steadily increasing influx of wealth, and demand for comfort, America had produced a type of house characteristic and original. From an artistic point of view, the best examples equalled, if they did not surpass, the highest standard of work in Great Britain; while, as regards convenience and comfort the type was superior to that common in England, and one from which English architects might learn much. Climatic conditions were responsible for the open type of plan characteristic of the American house, and a few of its more distinctive features were elucidated—the cellar for the heating apparatus, which also had an important part in determining the scheme of drainage; the complete system of heating, reducing draughts to a minimum, allowing double doors of extra width to be wide open, and leading to the almost universal adoption of sliding doors; the effect of spaciousness, even in small houses, due to the large hall and open doors; the verandahs, which had greatly developed in suburban and country residences, and became a characteristic feature in plan and elevation; the bedroom "closets," or receptacles for wardrobes, chests of drawers, &c., the heating system rendering the bed-chamber available as a secondary and independent sitting-room or snuggery, folding beds being largely used; the service-rooms, a marked feature of the American plan, less isolated than in the English houses. Types of town-houses were then referred to in detail, the lecturer selecting examples of the self-contained residence. The houses of the wealthy conform more to the European model, with American characteristics confined to matters of detail. Appreciative reference was made to examples of self-contained residences at Washington, in which the art of planning is admirably exemplified, the awkwardness of the site being turned to advantage, with due regard to the scale, proportion, and symmetry in the disposition of the apartments. Here, too, brick, the material of the country, has been employed in a natural and simple manner, with commendable reticence in design. The lecturer then followed with a description of apartment houses in New York, their appointments, rents, &c.; workmen's houses, with which New York is but poorly provided; suburban houses, dwelling particularly on an example at Brookline, of which a complete set of plans was exhibited; and various types of country houses and summer resorts. In his observations on construction and materials, which were treated at considerable length, the lecturer referred to the

STEEL-FRAMED CONSTRUCTION

so largely employed in the tall buildings of the States, as a factor exerting a very pernicious influence on the architects' art from the point of view of sound architecture. Buildings were constructed on the principle of a steel cage, divided horizontally into layers, with no internal supports to speak of, and the whole sheathed with an apparently—but utterly sham—constructional skin of granite, stone, brick, or marble. The stone corbelling under the projecting oriel, a constantly recurring feature, is, in nine cases out of ten, a sham. Window mullions, themselves probably formed of stone sheathing round a steel core, are carried by steel cantilevers bolted at the back into the girders of the floor below, and the correctly designed and jointed corbel courses with difficulty carry their own weight. The expense of stone—1¼dol. per cubic foot in New York—was offered as an excuse; yet the same house had its marble, mosaic, and hardwood finishings, at a cost ten times what would have sufficed for making the construction honest. For roofs, floors, and partitions, fireproof construction is now generally adopted in all important domestic work in the cities. The elaborately constructed brick and terracotta arches between the girders, common in England, are not used in the States for floors to be subjected to lighter strains. Floors with tension members are coming much into vogue. In the construction of flat roofs an extensive use is made, in combination with other materials, of "roofing paper" or felt, laid in several thicknesses and bedded in tar. Most commonly the outer skin is of copper, laid either directly on the concrete or on wood and felt, in sheets of 12in. by 24in., and with soldered joints. Partitions are commonly built of hollow blocks of porous terracotta. Tiles of similar type are used for casing structural steel work, and in some cases instead of lathing on the internal wall face. Thin fireproof partitions, finishing from 1¾in. to 2¾in. in thickness, are much in favour from the saving in space effected. These are mainly constructed by using channel or flat bars, with expanded metal lathing or burlap between, plastered with hard setting mortar on both sides. Particulars having been given of methods of construction in vogue for country and suburban houses, the lecturer discussed the various

SYSTEMS OF HEATING

employed, observing that Americans regarded our system of open fires with something of the same feelings as we did the apathy of some of the more outlying countries of Europe and the East concerning modern ideas of sanitation. Nevertheless, the fireplace is as general a feature in American as in English houses, serving as an effectual, and generally the only, ventilator, and valued for its cheerful appearance and the decorative character of its surroundings. Steam, hot water, and hot air are the means of heating mainly employed, the two former being much the same as used in public buildings in England. Warming by hot air, essentially applicable to small areas, and almost unknown here, is practically universal in the States for all houses costing about 6,000dol. (£1,200) or less. In the smaller class of city houses, in apartment houses, and hotels where the limitations of space render a multiplicity of air-flues embarrassing or impossible, and where its superior cheapness is of importance, direct radiation, either by steam or hot water, is universally adopted. In the more luxurious and expensive city houses indirect radiation is the invariable system. In the largest mansions the assistance of an electrical or steam-driven fan is invoked to regulate the distribution of the heated air, which is also screened and moistened as required. In treating of these methods of heating, after a brief reference to one or two special forms of installation, the lecturer dealt more fully with the hot-air system as being least known in England, illustrating his description by diagrams of the apparatus, the furnace, cold-air supply, and hot-air flues. In matters of plumbing and drainage, which were next discussed and described in minute detail, the lecturer said America had made great advances of late years, and was now far ahead of England. This progress was mainly due to the stringent laws adopted by the city "boards of health," and rigidly enforced. Before building, a separate and complete set of plans and sections, showing plumber work and drains, to the scale of ¼in. to the foot, had to be deposited with the boards. On these the nature and positions of every fitting, pipe, and trap must be clearly indicated. Draft specifications, some clauses from which the lecturer summarised, are issued by the authorities for the guidance of architects. Two main characteristics are apparent in this class of work—viz., the openness of everything, possibly owing to the cellar system, and the substitution, along with cast iron for fireclay drains, of wrought iron and brass or lead in the supply and smaller waste pipes. The lecturer closed with a description of the "Waring" system of sewage disposal for isolated houses and small communities, which is employed very generally throughout the Eastern States, and, as he maintained, with entirely satisfactory results.

Professor Robert Kerr, in proposing a vote of thanks to Mr. Paterson, referred to the great mass of detail which he had brought before them with regard to the internal fittings of American houses. It was fifty years since the speaker visited the United States, but he had kept in touch with the progress in construction that had been going on. American house-planning showed many peculiarities due to the national characteristics, but he confessed he could not see what benefits were to be derived by English architects from its study. The chief differences were due to the love of openness and of display, and of the entirely altered footing on which employers and servants found themselves, a change in social relationship which showed itself in the arrangements of the house. The reception-rooms of many houses in New York displayed a fondness for hotel life; all the reception-rooms were *en suite*, and, in his judgment, the comfort of the house was entirely sacrificed to a love of display. The sliding doors which were substituted for our hinged and folding doors did not conduce to comfort or privacy; the hall was but a rendezvous leading to a string of apartments united by sliding doors, and the bedroom closet was stuffy and musty. The only feature which we could adopt with advantage was the open verandah.

Mr. H. H. Statham seconded the vote of thanks, which was carried unanimously and acknowledged by Mr. Paterson, who remarked that, owing to the equable heating of the rooms, there was not that necessity for closed doors which we experienced, and the average American liked a degree of publicity which would be distasteful to us. The bedroom closet was, in practice, a very convenient arrangement.

THE SURVEYORS' INSTITUTION: VISIT TO MANCHESTER.

The Surveyors' Institution held their first provincial meeting at Manchester on Wednesday and Thursday last, a large number of the members attending, and several distinguished guests also being present. The first day (Wednesday) was devoted to business, and the second to excursions to various places of interest and important works in the neighbourhood. The papers read and discussed at the meeting in the Lord Mayor's Parlour at the Mansion House, Manchester, were Mr. Holden's, Mr. Blashill's, Mr. Hall's, and Mr. Clarke's. In the evening the members and guests, numbering about 140 in all, dined together at the Grand Hotel, Mr. Robert Vigers (senior Vice-President) being in the chair, in the absence of Mr. Christopher Oakley (President), who was prevented by ill-health from being present.

MANCHESTER, 1847 TO 1897.

At the afternoon meeting the first paper read was one on this subject by Mr. John Holden, F.R.I.B.A. (Fellow), Chairman of the Counties Palatine Provincial Committee, and of the Reception Committee organised by the Manchester members of the Institution. Mr. Holden's paper was illustrated by a map, showing, from the Ordnance Survey, the changes and improvements which had taken place in Manchester and Salford during the period covered by his paper. In 1847 these two towns were practically contained within a circle of one mile radius, many of the streets were narrow and crooked, and access from one street to another was by no means convenient. The streets were paved generally with cobble stones, imperfectly set and punned. In some of the principal streets, paved with square sets on a cinder bed, and with the joints filled with cinder, the mud was such as the present generation could hardly imagine. Old half-timbered houses, picturesque but not desirable, abounded, but have now almost disappeared under the stress of improvements. Mr. Holden proceeded to enumerate many of the important improvements, both in the erection of buildings and the widening of thoroughfares, which the last half-century had seen, and especially referred to the changes which had been effected in the railway stations and the approaches to them. What were mere wayside stations in 1847 were now replaced by the magnificent buildings which formed one of the principal features of modern Manchester. From time to time new railway stations were opened,

new public buildings erected, and last improvement of all, the Ship Canal was, after many difficulties, opened in 1894. The result of the great increase of business, and the alterations necessary to meet it, was the removal of many works and mills from the city itself to cheaper land in the outskirts, and the operatives naturally followed in the same direction. The rates in Manchester varied from 4s. 6d. in the £ in 1847 to 6s. 10d. in 1897, and in Salford from 4s. 6d. to 6s. 6d., having been at one time as high as 7s. 5d. The ratable value of Manchester was in 1847 about £640,000, but was now about £1,537,000. The city itself was no longer to any extent residential, the clearing of insanitary areas, the abolition of back-to-back houses, and the closing of cellar dwellings having forced the population outwards. The warehouses had increased in height and stability; hydraulic and electric power, both supplied by the corporation, were superseding the use of steam power, to the great improvement of the sanitary conditions. The old brick sewers had been replaced entirely by glazed pipes. The regulations as to drains were especially strict, all drains inside the area of buildings having to be laid in concrete; but Mr. Holden more than hinted that the "army" of sanitary inspectors had some little difficulty in coping with the "jerry builder" even in Manchester. The great question of the disposal of the sewage was still unsettled. The building regulations had, after many years' persistent urging on the part of the Manchester Society of Architects, been enlarged so far that, from a pamphlet of six pages, they were now expanded to some 134 pages, which Mr. Holden considered a matter for congratulation on the part of the public, although the jerry builder did not see the matter in quite the same light. Manchester seemed, according to the author, to suffer much as London does from the multiplicity of bodies authorised to interfere with the traffic of busy streets, who, having control of water, gas, sewers, telegraphs, telephones, hydraulic power or electric light, arrange carefully to wait until one body of men has taken up and relaid a street, for another body to repeat the process. The parks and open spaces of Manchester and Salford now, said the author, occupy about 727 acres, and the cemeteries about 200 acres; the water reservoirs cover about 860 acres, with a gathering ground of 19,000 acres. The population on an acreage of 13,000 was in 1891 nearly three-quarters of a million. Mr. Holden gave a series of figures showing the great rise in the value of building land in Manchester, varying, of course, in different districts, but all showing a large increase of value.

LESSONS FROM FIRE AND PANIC.

By Mr. Thomas Blashill, F.R.I.B.A. (Fellow), superintending architect of the London County Council. Mr. Blashill said that the fact that the destruction of a building by fire was an improbability removed this risk from the class of considerations with which an architect usually dealt. The proportion of buildings destroyed by fire was very low, and under ordinary circumstances the chance was apt to be neglected by occupiers and owners; but when a great calamity happened the public was only too ready to ask why precautions were not taken and to seek a victim, and by the standard then set up, the architect must expect to be judged. It was a question whether, in spite of Building Acts, danger from fire was not increasing among buildings, loftier, closer together, and more densely inhabited. Commercial premises were more densely packed; there was more machinery, timber and other materials were lighter and drier than ever; all arrangements for lighting were productive of new dangers; the proportion of window openings had been much increased, and shutters had been abandoned. The old-fashioned flush window-frame was being brought out again from its reveal, and made in thin casing which would easily catch fire and fall into the street. Lifts going through several stories neutralised the advantage of fireproof floors, and lighting areas common to different premises did away with the security of party-walls; while unrestricted skylights made ridiculous the provision for incombustible roof covering. In fact, said Mr. Blashill, the most scrupulously legal building of brick or stone might be no more than a kind of grate in which its internal structure and its contents could be most conveniently burned. In the Cripplegate fire the progress was about as rapid, and the destruction over its limited area no less complete, than in the great fire of 1666, and if our methods of extinction had not improved it might have easily rivalled that fatality in extent. The lesson was obvious. We must improve the construction and arrangement of our buildings, even though we went beyond Building Acts. In London, at all events, streets could not be widened, unoccupied areas could not be increased or openings for light reduced. Traders must be left to conduct their business in such a way as to make it possible; and in places of entertainment the numbers of the audience could not be curtailed. All that could be done was to diminish the chances of fire, to check its spread, and arrange for its extinction and the escape of inmates. It was unfortunate that the cause of most fires was unknown. They destroyed the evidence of their origin, and the great lesson was to distrust the safety of any building unless the greatest care was taken in its construction, and not to think that any deficiency could be made up by careful occupation and management. The points most useful to notice were, Mr. Blashill said: (1) the structure and arrangement; (2) legal and other provisions for preventing loss of life in dwelling-houses, in factories, in public buildings, and in theatres and music-halls. The party-wall was generally effectual as a separation between buildings if no illegal openings were made in it, and it would seem that it was most effectual when carried up through the roof. It would be desirable, where streets or areas were narrow, to have fireproof blinds or shutters to openings to prevent the spread of fire inwards or outwards. Every contrivance should be easily closable, and should be closed nightly. The author could not understand the slow progress made in this country in the matter of fireproof floors, which were common in Paris 35 years ago. In the Cripplegate fire there was not a single fireproof floor, though the warehouses had many of them been burnt out at least once. They were wooden floors on iron girders, and the behaviour of iron girders under fire was well known. There were many well-known fireproof floors in which the girders were well incased; but experience taught that great care must be taken that no escape of gas should be possible in the hollows of such floors, or serious explosions would result. In the great rehousing schemes of the London County Council he had taken care to have all the floors fire-resisting. He had used wide-spaced steel joists filled in solid with coke-breeze on which the floor-boards were nailed, and under which the ceilings were plastered. The cost was no more than a good wooden floor, while the thickness was only 7in., saving 2in. or 3in. in the height of each story. He had not heard any complaint as to noise. If wood floors had to be used, the ordinary pugging should, at least, be adopted. Thick joists 2ft. apart and filled in solid with some form of concrete would offer great resistance to fire, coke breeze and cement mixed 4 to 1 being the best. In a great fire the incombustible roof covering, with unlimited dormers and skylights was of little practical use. This might easily be avoided by pugging between rafters or by sheets of asbestos being used on roof boarding instead of felt. There should also be a ceiling of concrete over the topmost story. For partitions, lath and plaster or brick nogging should be avoided. He himself commonly used cement and breeze concrete 2in. in thickness. Very important steps towards making buildings fire-resisting could easily be taken at very little extra cost. The great danger of a staircase usually arose from the cupboard under it, probably stored with combustible materials. If of hard wood, it would resist a small fire for some time; but if it were to be fire-resisting, concrete was better than stone. All hollow places which could contain gas or accumulate inflammable vapour were dangerous. The lining of walls with matchboarding communicated fire at once all over a shop or from floor to floor. The hollows formed by heavy plaster cornices or behind skirtings also transmitted flame and inflammable gas without warning to adjoining or even distant rooms, as shown in several instances which Mr. Blashill quoted. By taking such reasonable precautions as he had indicated, domestic buildings could be made practically safe from fire. One company in London had erected industrial buildings containing some six thousand tenements, and in only one case had a fire spread from one tenement to another. Many attempts had been made to render fir timber fireproof, and had succeeded so far as thin timber went, but he had not found one which would render the mass of a joist or beam fire-resisting throughout. The matter was well worth further experiment, especially with reference to joinery. Although new buildings might be made fire-resisting, an even more important question at present was that of old buildings. In an ordinary domestic building, if the joists were not strong enough to carry a filling of concrete, they would bear ordinary pugging, and if only a breadth of 3ft. or 4ft. round each floor were filled in, as well as all hollows behind cornices, &c., a considerable amount of fire-resistance would be attained. If also the timber round chimney-stacks were removed, and floors and roofs examined, an old house might be made as fireproof as a new one. Most important of all was the question of saving life from danger by fire, and much legislative attention had been given to the subject; but it was impossible to estimate the mischief which a careless workman could do, and an architect must be careful not to assume that because his plans are for a safe building, it will necessarily be properly built or managed. Mr. Blashill mentioned the case of Cowdray House, in Sussex, which was destroyed by the carelessness of workmen, and gave some of the provisions of the London Building Act of 1894, which were designed to facilitate the escape of the occupants of houses of more than 60ft. in height, that being the greatest height to which a movable fire-escape would reach; but 60ft. was a great height from which to expect women and children, suddenly alarmed and ill-clothed, to descend by a ladder in the dark. The ordinary ladders should be replaced by others with flat treads, an easy slope, and handrails, and there should be some protection against falling into areas or skylights. Mr. Blashill preferred the term fire-resisting to fireproof, as did the framers of the London Building Act, for the construction should be such as not to add fuel to the fire, but to resist it for at least a considerable time. By the Factory Act, 1891, every factory, where more than 40 persons are employed, must be provided with means of escape from the upper floors, and the Act of 1895 extends these provisions to workshops and laundries. There should in all cases be a means of access, not to the ground floor of a building, which might itself be on fire, but to some open space where the glow and heat of the fire could be avoided. Many of the victims of the Paris Bazaar fire died in the open yard, which was not large enough to enable them to get away from the heat. In deciding what are adequate precautions, it was necessary to take many circumstances into account; but in the case of factories, as in that of theatres, there should be alternative means of escape at different extremities of the building. The best way of escape, after the staircase, was by the roof, a good flight of stairs being provided to the roof door, which should have an automatic fastening, and by this means many lives were saved in the great Cripplegate fire. There was always, however, the objection that roof doors gave special opportunities to thieves. The Building Act of 1894 made many new provisions for the safety of public buildings generally, which were really a mild adaptation of those which had long been applied to theatres and music-halls. There were many more accidents from alarm in places of worship than was commonly supposed, very inadequate means of exit being generally provided, instances of which the author gave.

SOME OF THE DIFFICULTIES MET WITH IN A LAND AGENT'S PRACTICE.

Under the above title, Mr. C. P. Hall (Professional Associate), agent to the Duke of Bedford's estates, read a paper in which he dealt with the points which, in the present depressed condition of agriculture, demanded the especial attention of a land agent in charge of large rural estates. Perhaps, he said, the most frequent of these difficulties was that arising from the question of rent reduction. Many landowners had met their tenants by remissions rather than by permanent reductions of rent; but as the depression continued, it became very difficult to conciliate all the tenants by a uniform remission, and variety of treatment produced discontent. The author's experience was that it was far the most satisfactory plan to reduce all the rents to present value, and, if any further assistance was necessary, to give it in the supply of manure and feeding stuff rather than in money. Again, as assessment committees often refuse to allow for remission of rent, it was often the case that the assessment under Schedule A was actually higher than the rent received, and it was difficult

to induce tenant farmers to appeal against assessments made on them in more prosperous times. The difficulty of obtaining labourers was a growing one, the superior attractions of the towns inducing all the young men to give up what was truly a somewhat dull routine of life in the country. The hours of labour were shorter and the opportunities of amusement greater, and although expenses were higher in the towns, wages were comparatively higher as well; but there was not, as in the case of stock-men, any Sunday-work. Still, the author thought there was a reasonable chance of advancement in life for really intelligent and industrious workers on farms, and as competition in the towns became keener and the rate of rural wages rose—as it inevitably must do—he foresaw some chance of the agricultural population again returning to the soil. The allotment system had been, he thought, overdone, with the result that many labouring men, finding the produce of their allotments unsaleable at a paying price, had abandoned them. Complaints had been made of excessive rental; but a reduction of even 10s. off a £2 rent would not make a success out of an utter failure. Mr. Hall held that the most satisfactory way of carrying out repairs to buildings and fences on a large estate was to employ the workmen direct; but in the case of large new works the contract system was preferable.

NOTES ON THE CONSTRUCTION OF TOWN BUILDINGS.

Mr. Howard Chatfeild Clarke (Fellow) who was unable to attend, contributed a paper on this subject. He dealt mainly with the planning and construction of buildings, although he recognised the value of attention to architectural features and style. Indeed, he held that one side of an architect's work aided the other. He could not agree with some recent critics that there had of late been a "deterioration in English architecture," but was of opinion that the exact opposite was the case. Architecture in the last 80 years had improved not only in construction, but in design, as the buildings in Manchester amply testified. The requirements of town buildings, such as banks, warehouses, offices, and schools, appeared to him to be—1, ample lighting; 2, simplicity of plan and arrangement; 3, good ventilation and heating; 4, good sanitary arrangements; 5, protection from fire; and 6, the use of suitable materials. On the whole, modern methods of construction met these several requirements to a very large extent, and the warehouse or business premises of to-day, whether in London or Manchester, or in any other great centre of trade, compared favourably with its predecessor in all of the points which he had laid down as essential. The question of protection from fire had been so fully dealt with by Mr. Blashill that there was little left for him to say on the matter, but he might mention that in London architects had found a very considerable number of new regulations on this point, contained in the Building Act of 1894. Buildings under this Act were classed as dwelling-houses, domestic dwellings, public buildings, and buildings of the warehouse class. There were many regulations as to the erection of new buildings on sites previously occupied, which tended, he thought, to the erection of better and more commodious buildings; but this, of course, applied to London only. The height was limited to 80ft., unless the consent of the County Council could be obtained for a greater height, and this was a regulation in the right direction, for excessively high buildings, where the streets were necessarily somewhat narrow, meant draughty, sunless, and cold thoroughfares, detrimental to the general health of the inhabitants of a large town. The provisions of the Act as to the limit of the cubical contents of a building without a fireproof separation from all adjoining buildings were useful, but this point had already been dealt with by Mr. Blashill in his paper. Mr. Chatfeild Clarke showed some plans of buildings erected under his supervision in Aldermanbury, London, fitted with fireproof doors which he believed would resist fire as well as the thick brick wall itself. He was not quite sure whether the Manchester By-laws limited the size of individual warehouses, but he would be glad of information on this point. Under the London Building Act, oak and teak, and other hard timber not less than 2in. thick, is allowed for doors and stairs, with 2in. risers and concrete composed of broken bricks, stone chippings, or ballast, and lime-cement or calcined gypsum for filling between joists, are deemed to be fire-resisting. The author referred to the great labour and expense which the Institution had devoted to the perfecting of the London Act, and the valuable services which had been rendered in this direction by Mr. Steward, Mr. Cubitt Nicholls, and Mr. Arthur Garrard (the two last of whom the Institution could unfortunately no longer count among its members). Mr. Clarke proceeded to insist that the only safety lay in sufficient party-walls, carried sufficiently high above the roofs, good iron doors in party-walls where openings were really necessary, the casing of all ironwork in plaster at least ½in. thick, high party-walls between adjoining skylights, and external shutters in confined well-holes, and areas overlooked by premises in several occupations. He believed that the best fireproof floor was one composed of five parts of good coke-breeze and one of Portland cement. Mr. Clarke advocated the carrying-up of all windows in town streets into the floor above that on which they were situated, as advantageous for lighting purposes; but we are a little doubtful if Mr. Blashill would consider this advisable from the point of view of fire protection. He confessed that, as regards proper ventilation and warming, architects had still much to learn; but for an ordinary room there was no much better plan than the double-hung sash, with a deep sill-board for the admission of fresh air at the meeting-rail level. Grates fitted with warm-air chambers had worked well, especially in the London Board Schools. Sanitary requirements were now receiving greater attention than ever, and the best of the present systems left little to be desired. Mr. Clarke warmly advocated the increased use in this country of granite as a building material, as the most suitable for town buildings, and gave instances of the cost of various buildings in London, which, he was careful to say, must be taken with some reservation, as the price of labour and materials varied so much that it was difficult to give reliable figures. He gave, as examples:—Warehouses, Thames-street: Brick, wood floors, not plastered, 117,600c.ft., 7d. per cube foot. Schools, Hornsey, London, N.W.: Brick, buff brick internally, glazed brick dados, wood-block floors, 7½d. per cube foot. Drapery warehouses, City of London: Fireproof floors, stone front, plastered walls, 1s. 1d. per cube foot. Flats, South Audley-street, London, W.: Stone and terracotta, fireproof floors, electric lift, hardwood finishings, parquet floors, enriched plaster work, 176,000c.ft., 1s. 2d. per cube foot.

STAGE MECHANISM.*

A MOVEMENT known by the name of "stage reform" has of late years received some attention in this country. It originated some twenty years back in Austria, with the primary object of encouraging the greatest possible imitation of nature in the *mise-en-scène* of opera and drama. The rudiments of art, as understood by painters, sculptors, architects, and the cultured public of the day, were to be applied to the stage, and a true scenic art was to take the place of the nondescript, irrational, and frequently coarse mounting previously given to plays. To facilitate the efforts of the scenic artist, the fullest application of our modern sciences (notably of mechanics and hydraulics) in the interest of "stage reform" was considered essential, and the introduction of recent methods of lighting was also deemed necessary. The numerous fatal conflagrations which had originated on the stage caused the question of protection from fire to be closely associated with the movement, while the frequency of dangerous diseases among the members of the dramatic profession preserved the claims of hygiene from neglect. The movement, as I have said, originated in Austria, soon after the terrible "Ring" Theatre fire at Vienna; and, on account of the prominence accorded to protective measures against fire, much headway was at that time made in German-speaking countries. Able exponents were found among leading artists, and stage-managers, architects, engineers, firemen and last, though not least, the Government and municipal authorities, interested themselves in the matter. Since then the movement has not only surely and gradually developed throughout Austria and Germany, but also spread beyond the frontiers of those countries. Concurrently, some quite independent movements also originated amongst several other nations, and, though the purposes of these were not identical, they were very similar. Throughout Europe a transitional period may be said to have begun for the stage. Up to the present time, however, this period has nowhere attained its desired termination in any generally recognised reform. No definite new era has yet been opened, even in the countries where the movement first obtained a footing. Experiments have been numerous and various, and the failures have almost outnumbered the acknowledged successes. The boldest experiments, with their valuable achievements and costly failures, have, however, now been made, so that little remains to be done except the practical and systematic application of the experience gained. I may here at once say that I see no reason why the experimental or transitional period of the movement should not now be superseded by a new and definite epoch, more especially if the matter is taken up by men who are free from fads of their own. The primary object of the originators of the movement—i.e., the closest possible imitation of nature—has in several instances already been attained; but the art world, and the cultured also, have found that this generally means crude realism. The mystery of the *mise-en-scène*, so necessary to a good scenic picture, is lost, and much also of the so-called "feeling" of the spectacle is lacking. Modern science and the most recent methods have already been employed to some purpose in the interests of the mounting; but stage managers and experts have found that an extreme modernisation of the scenic artist's auxiliaries often means more complication and uncertainty than was formerly the case. The expenditore incurred by extreme reform on the stage has also been found to be disproportionate to the advantages gained therefrom. Both in the effects to be obtained, and in the methods to be adopted, practical reform is now gradually taking the place of radical reform. There can be no doubt that the exponents of the extremist movement have given the necessary impetus towards the improvement of the scenery, and future generations will be greatly indebted to them. As is usually the case, however, with any radical reform, the originators of the movement are scarcely likely to see their proposals adopted in their entirety. Nevertheless, they may be well satisfied that a moderate and practical outcome of their efforts is assured. And this is a great deal when we consider to what an extent the stage clings to tradition and convention, and repudiates any interference from outsiders, and how sweeping the proposed reforms appeared twenty years back. In England, the primary object of "stage reform," the imitation of nature in the *mise-en-scène* of both opera and drama, has certainly found a fair amount of favour. This, however, is virtually due to the manner in which the public have associated the movement with that crude realism which has of late met with so widespread an appreciation in all branches of art and letters. There has been no outery against the indifferent mounting of a play, and the realism of a spectacle has generally been more appreciated by an audience than its merits as a work of art. "Stage reform" in this country is still associated with the sensational shipwreck, the race, or some other exciting item of the programme, and any popularity of the movement is practically due to the rendering of such realistic scenes. There have not yet been many instances where art alone has helped the movement; but for that matter, perhaps, we have not seen many examples of a *mise-en-scène* on truly art lines. With very few exceptions on a small scale, no extreme reform has been attempted in this country as it has in Austria and Germany. This is largely due to the fact that our actor-managers have to rely on their own purses or on those of some speculative financier, instead of having a certain proportion of public funds placed at their disposal. Our managers cannot afford expensive experiments. Too much risk is involved in the sudden departure from traditions and conventional usages, and the most that can be undertaken is a gradual improvement of the scenery on the old lines. Such improvements, as distinct from extreme reforms, there certainly have been. Sir Henry Irving, of the Lyceum Theatre, is a notable exponent of moderate reform. The late Sir Augustus Harris, our leading *impresario*, also did much in the gradual beautifying of his scenes on recognised lines, though he was frequently hampered by the fact that his productions

* Read before the Society of Arts, Wednesday, April 20, 1898, by Edwin O. Sachs, Architect, author of "Modern Opera Houses and Theatres," &c.

required a too realistic mounting of the ultra-sensational kind. If we wish to see a *mise-en-scène* on art lines, the outcome of extremist experiments, we have only the private stage at Bushey, where Hubert Herkomer, who at one time took a leading part in the movement in England, has at his own expense achieved numerous successes as a stage-manager and scene-painter. His miniature stage has been a working model from which our actor-managers have learnt much. Those who have had the good fortune to see one of the Bushey performances will have realised the difference between nondescript mounting and really artistic scenery. The general public little knows to what an extent the efforts of Hubert Herkomer have effected stage-management. Without his private experiments it is hardly probable that even Sir Henry Irving's stage would have shown such improvements as are now accepted as a matter of course. The curious feature, however, of the movement in England is not so much the absence of extreme changes in the scenery of our stages, as the almost entire absence of the application of modern science and modern methods in the interests of the stage-management. Even the few exceptions which do exist generally concern only the substitution of electricity for gas in stage lighting, or some minor or mechanical appliances to facilitate what is termed a "quick change." We are, for once, untrue to our national reputation for practical adaptations; and this, moreover, in a case where there is unlimited scope for energetic young engineers. In this country, again, the question of fire protection has not been associated with the movement, and the advancement of stage hygiene seems scarcely to have been considered by our exponents of "stage reform." The former omission is, of course, quite in keeping with our traditions. We insure our property, and never consider the tremendous national loss by fire, nor do we take measures for the protection of life from fire until some great catastrophe has fallen upon us. But in the matter of hygiene, such neglect is unusual in a country which prides itself on its leadership in matters connected with sanitation. I now propose to show how far modern sciences and methods have already been brought into the service of stage-management, and how the protection of audiences and employees has been attended to, so far as the arrangement of stage is concerned. I do not intend to formulate any model code of requirements, or to describe any model stage of my own. This paper will solely indicate examples of stages erected during the last twent-five years, in which attempts have been made to fulfil modern requirements with the means at our disposal at the end of this great century of technical progress. Earlier examples of stage machinery are not dealt with, as these can easily be explained from what I shall term a typical example of the English stage of to-day. There is little difference between the ordinary London stage of 1897 and the stage of 1700. The electric light may have incidentally taken the place of the lime-light and gas of recent years, or the candles and lamps of an earlier period, and, as I have observed, there may be some "tricky" mechanical detail or slight improvement in the minor gear; but such unimportant contrivances, I am afraid, complete the list of changes made. Even where the *mise-en-scène* is improved so much as at the Lyceum Theatre, the antediluvian wood stage still remains. London, however, is not the only city, nor England the only country, where such lack of progress is observable. Modern stages are as yet rare abroad, except in the countries where "stage reform" originated. The only difference is that, while some of the oldest and worst stages in London have been known to show excellent mounting, good scenery abroad will, as a rule, only be found on a modern stage; and I will here take the opportunity to express my admiration at the perfect scenic arrangement of some of our plays, for the production of which our managers are so greatly hampered by their pitiable stage equipment, which compels them to have recourse to innumerable makeshifts. It would, however, be impossible for the London manager to do such excellent work if he had to change his play-bill daily, as is frequently the case on the Continent. The so-called "set-pieces," for instance, could not then be so extensively used as they are now. It is probable that plays with long runs, in which the stage-carpenter's work becomes mere routine, have partly been the cause of our tardy progress in "stage reform," while the more complicated requirements of a continually changing play-bill must have assisted the movement abroad. Before going further, I may mention that, with a view of studying modern stage mechanism, I have personally visited most of the theatres on the Continent possessing modern stages. Every facility was granted me by the authorities in every case, so that it is not without a full knowledge of the most recent developments that I have ventured to address you to-night. I must, however, as an architect, claim your indulgence for any errors of expression in dealing with a subject which rightly belongs to the allied profession of the engineer. But, curiously to say, no English engineer seems to have as yet given the stage and its possibilities any special thought. And, what is more, no English stage mechanist nor carpenter has ever given us any publication dealing with the wood stage of old that might serve as a basis for my remarks. I am, therefore, practically broaching an entirely new subject or section in that vast world commonly known as "Technical Science." It would certainly be premature to attempt any rigid form of classification in so new a subject. The exact definition of the headings seems to me practically impossible. It would, however, be well to note that stages may readily be grouped according to the materials of which they are constructed. I will therefore use the main divisions: Wood Stages, Wood-and-Iron Stages, Iron Stages; and will make further subdivisions according to the power chiefly employed in working the appliances. These subsections are: Manual Labour, Hydraulics, Electricity. Owing to the almost entire absence of steam for motive power in connection with stage machinery, a separate division for appliances where steam is employed is not required. I first take the Wood Stage, then the Wood-and-Iron Stage, and, lastly, the Iron Stage. Manual labour is employed in all three, but electricity and hydraulics are only to be found in connection with the latter. Hence, the division of the subject is practically as follows:—Wood Stage: Manual Labour. Wood-and-Iron Stage: Manual Labour. Iron Stage: Manual Labour, Hydraulic Power, Electrical Power. Before, however, speaking of the stage, I must particularly call attention to the purposes of the various classes of playhouses for which scenic paraphernalia have to be provided. This may at first sight appear out of place; but I hold that if the purposes of the different institutions are borne in mind, it will greatly facilitate the appreciation of the circumstances which govern the construction and working of stages, and the structural as well as the economic difficulties which have to be overcome. I must also remind you of the necessity for studying the planning of a modern playhouse, more especially in regard to the stage and auditorium, for it should be clearly remembered that stage mechanism is not everything, but that the sighting and acoustic properties have to be considered. The outlines and dimensions naturally depend in the first place on the respective requirements of the stage-management or owner; but in the same way as the lines of the auditorium are essentially governed by the proscenium opening, the setting out of the stage is regulated by the height and width of this all-important feature. Many stages have so-called rear or back-stages, the dimensions of which are, however, dictated mainly by the facilities to be afforded for obtaining certain effects. Altogether I would emphasise that the engineer who wishes to give attention to the subject of stage-construction must fully comprehend the requirements and possibilities, and it is absolutely essential that he should not only know the wishes of an individual client, but also the varied policies or makeshifts necessary under different circumstances, and above all in different countries. In my work "Modern Opera Houses and Theatres," and in various papers read before the Royal Institute of British Architects, the Architectural Association, and elsewhere, I have already spoken of the very different manner in which theatre construction is treated by the architects of the Continent as compared with the way in which it is dealt with in this country. I have laid some stress on what I might almost term the difference of feeling which pervaded theatre architecture, and it would not be out of place to repeat that there exists a considerable distinction between the artist and leader of his profession who is responsible for the Continental buildings, and his more practical *confrère* of our own Metropolis. In the same way as there is a decided contrast in the character of those responsible for the erection of theatres in this country as compared with those on the Continent, so there is a wonderful difference in the *personnel* responsible for the construction and working of the stage. With few exceptions, the construction of our stages is in the hands of a stage-carpenter, who has had no exceptional advantages in the way of technical training, and whose position in the theatre is hardly better than that of any foreman of artisans. Abroad, even for the construction of wood stages, the commissions are given to fully qualified engineers who hold influential positions in their profession. More particularly in German-speaking countries, there is a distinct calling of stage engineering, and though some few of the present leaders may have risen from the ordinary stage-carpenter, this profession is practically now only composed of men whose preliminary training alone often approaches that of our Royal Engineers. The body of stage-engineers includes men with exceptional powers of initiative, as may be judged from the examples of hydraulic and electric stages which I propose to show, and the way in which the work is usually executed also displays, I am glad to say, such full consideration for the requirements of the scenic artist as is seldom found where the interests of art and science clash. In several instances, even, the stage-engineer takes also the position of "director of scenery" (Artistischer Leiter), and he is held responsible for all stage effects, including the design of the scenery, which is prepared under his supervision. This last-named combination of offices in one man I certainly do not hold with, and I would add that the arrangement is but rarely successful. I prefer to see the mounting of a play in the hands of a scenic artist of recognised standing, to whom the engineer and the principal of the painting-room should be able lieutenants, and not collaborators on an equal footing. One mind alone should govern the mounting of a play. All the larger theatres of the Continent, it is noticeable, employ permanent engineers, whose appointment is mostly in the gift of the owner, and is held continuously, irrespective of any change in management, lesseeship, or varying appointment of scenic artist. It is not my intention to indicate how much the scope of the engineer depends on the individual in charge of the stage—in other words the stage-manager, lessee, or actor-manager, as the case may be—nor do I wish to speak of the various circumstances on which depends the amount of attention the mounting of a play receives, what effects are attempted, and what methods are employed. All this would lead too far, though, to repeat, it is essential for the theatre engineer to be versed in the varied requirements that he may be called upon to consider. I cannot, however, when speaking of the modern stage, omit some mention of expert opinion on scenic art and its auxiliaries, for nothing has so materially influenced the recent development of stage mechanism as the candid criticism of recognised authorities. In the first place, let us look at the question purely from the artist's point of view. The distinguished artist Hubert Herkomer, holds "that the real secret of perfect scenic art lies in illusion"—*i.e.*, in visual deception—or in not allowing the eye of the spectator to discern the means whereby the semblance of reality is obtained. Mere actuality will not accomplish this any more than good painting *per se*. It is in the attempt to get absolutely every requisite effect by painting that so much mystery is lost on the stage, for the scenic artist's art should be as much concealed as that of the actor. It should not be too manifest whether a background is painted or modelled, any more than that an actor is "made up" or appears in his natural form. Let us remember that an actor whose wig, for instance, is so badly fitted that his own hair is visible would not be tolerated for a moment; and yet the public will accept a street scene painted on a canvas that is moved by every draught, a rose-bush cut out of thin boards, or a moon rising very quickly straight up the sky and then remaining stationary. Do not forget that it is quite safe to let down a wobbly sheet of canvas close to the footlights, with a scene painted thereon representing breakers dashing over the rocks, and perhaps a sinking ship in the distance to which the actor may have to refer in his speech. It is safe to have layers of canvas hanging from the "sky" like so much washing hung on a line, and certainly but few have ever questioned the prerogative of the "firmament" to come together

at right angles in the corner. Why, it would take almost a volume to describe the many anomalies of scenery constantly observed on the London stage. Again, from the stage-engineer's point of view, authorities abroad have published opinions which are not so very unlike Herkomer's. They assume that the desire for realism which pervades the 19th century has completely changed the ends and aims of modern scenic art. The decorative artist, like the actor, must know how to be in earnest. Actor and scene-painter alike must, above all, so labour that the audience shall forget that they are within the four walls of a theatre But our old stage methods prevent the realising of such an aim, and the impression of an audience that they are only witnessing a play is often far too palpable. Why have the horizon cut horizontally to a crease, showing where the cloth has to be canked? Why let our beautifully painted panoramic scenes jerk along according to the jerky manner in which the scene-shifter handles his drums? The panoramic scenes may cost £1,000, and yet the simplest mechanical contrivance to insure their smooth working is grudged, and the effect entirely spoilt. Surely, gentlemen, this is not as it should be. Does it not seem curious that in these enlightened times the theatre should still have to develop behind the back of society, and that the memory of the former condition of things still clings to matters theatrical? Truly the actor of to-day is treated well enough by society: he is no longer a vagabond and a stroller. Nevertheless, the stage still occupies an exceptional position: it is still to a large extent ignored by the State and by Science. Let us look at the matter even from the most prosiac point of view—its commercial aspect. Science has turned industrial. She tins meat and condenses milk. But she has not troubled herself about the stage. We employ the same wasteful methods as if modern science were non-existent. Surely it is time to wake up to the necessities of modern entertainment! A large number of drawings, photographs, and sketches of stages were here shown as limelight views, and these were explained and criticised by Mr. Sachs. Reference was also made to a collection of drawings exhibited in the lecture-room. Among the stages of which illustrations were shown were the following:—A Typical Wood Stage, Drury Lane, Covent Garden, Her Majesty's, Court Theatre, Dresden; Court Opera House, Vienna; National Opera House, Paris; Municipal Theatre, Rotterdam; Palace Theatre, London; Court Theatre, Schwerin; Municipal Theatre, Amsterdam; National Theatre, Christiania; the "Asphaleia" system; Municipal Theatre, Halle; National Opera House, Buda Pest; Hofburg Theatre, Vienna; Court Theatre, Berlin; Court Opera House, Munich; special appliances at Drury Lane.

AMALGAMATED SOCIETY OF CARPENTERS AND JOINERS.

THE annual report of this society has been prepared and issued from the general office in Manchester by Mr. F. Chandler, the general secretary. The society has 735 branches, 32 having been opened during the year and six closed. There are 38 branches in the United States, eight in Canada, seven in New Zealand, 28 in Australia, and eight in South Africa, the remainder being in the United Kingdom. The new members enrolled in 1897 numbered 9,270, the exclusions 4,418, and the total membership at the close of the year was 53,057, an increase during the year of 4,426. The receipts for the year were £137,238 10s., which included £10,793 raised by levies in support of the society and other trade unions. The disbursements were £106,886 4s. 8½d., and the cash balance at the close of the year amounted to £136,308 10s. 8d., an increase for the year of £30,352 5s. 3½d. The disbursements included sums for unemployed benefit, tool benefit, sick and accident benefit, burial of members and their wives, and for aged members' superannuation. As regards the expenditure on "trade privileges," the following remarks are made:—"This branch of our expenditure is one that is watched with deep interest by our critics, as it represents strike-pay and the maintenance of the privileges of our trade (called by some the 'war-chest'); but out of an expenditure of upwards of £106,886 we have only needed for our ordinary section a sum of £5,807 10s. 2d., or an average of 2s. 4½d. per member, which is £6,077 less than 1896 and the lowest amount expended since the year 1889. This satisfactory reduction cannot be attributed to the fact that we have not improved the condition of our members; on the other hand, the formidable list of places where wages have been advanced shows our activity in this direction. But employers have shown a more willing disposition to concede the right of our members to participate in the benefit of good trade, and there has been also a willingness on our part to be guided by reason and moderation in making demands." The recent dispute in the engineering trade is alluded to, and it is pointed out that, although the interests of the society are "closely allied with engineering operations, the society has passed through the ordeal almost unscathed. What the society has to learn from that great struggle is that federation is a success when formed and matured on the lines of resistance in one exclusive industry. It is reasonable to assume that the same principle properly worked out would tell in favour of labour; but we have not yet such reliable evidence that employers can so harmonise their conflicting interests as to be able to form a federation of a variety of trades for a similar purpose. Therefore, pending the settlement of the question of a general federation of trade unions, our duty clearly is to urge forward and persevere in establishing more complete unity amongst what is known as the building trades, so that in the event of history repeating itself by substituting building trades for engineering trades, we shall then be prepared to meet it in one solid phalanx, instead of our strength being frittered away in sectional attempts to deal with an organised body of capitalists."

SANITATION AND THE FINE ARTS.

IN connection with the Royal Society of British Aitists, Sir Wyke Bayliss (president), on Saturday, gave an address in the large gallery of the society, upon the duty of the dwellers in great cities in respect to the nurture of the fine arts. The address was entitled "Art in the House of Her Friends." Having suggested, in explanation of this title, that if art had any friends anywhere, they were to be found amongst the dwellers in great cities, the president pointed to the connection between the work of the artist and the work of the sanitary engineer. What, he asked, was art but the science of beauty, and what was sanitation but the science of health? Health and beauty were almost synonyms. Where there was perfect health there was beauty, and where there was perfect beauty there was health. If health was the foundation of the Temple of Beauty, beauty was the shrine in the Temple of Health. Unfortunately, this intimate relation between health and beauty was not popularly understood. It was not, for instance, realised that the advance of architecture was seriously hindered by the insanitary condition of our great cities. Dirt stopped the way of all the splendid developments of decoration by virtue of which architecture took rank amongst the fine arts. He asked his audience to think what the façade of a public building might be but for the all-pervading, ever-increasing plague of atmospheric dirt. They need not go back in imagination to the times when their forefathers saw the splendours of Westminster Abbey, its delicate tracery, its shafts of marble, its wealth of statuary, long since lost to them in the veil of black slime that covered everything in London. Cathedrals in purer air—Lincoln, Winchester, Ely, or Salisbury—still showed what magic could be wrought by the wizards they called architects. But in London the air was thick with smoke. People passed and repassed, and knew not that the grimy objects that filled the niches of the abbey were amongst the loveliest of the sculptures that the world had ever seen. This showed how much we lost of the work accomplished by the great architects of the past. But the limitation on the efforts to create new forms of beauty by the introduction of colour was also to be considered. The resources of the lapidary and of the worker in mosaic were lost to these architects because of the foulness of their atmosphere—a foulness not inherent to it, but made by the populace in the innocent process of cooking their mutton chops. The fault was not to be charged to their climate. Milan was amidst the plains of Lombardy; Rome was within the reach of the miasmas of the Campagna; Genoa, Pisa, and Venice were wet with the salt mists of the sea. No, it was not the climate they in London had to fight against, but the climate plus dirt. It was the climate in unholy alliance with the guerrilla contingents of smoke and foul gases that decimated their forces, and carried foolishness into the councils of their building committees. He asked, Were they ever going to clarify the air of London, and Liverpool, and Manchester, and the other dark places of the earth? If it was true of the dark places of the earth that they were full of the habitations of cruelty, it was also true that they were full of the habitations of ugliness. Were they going to give the artist that which he valued as his life—that without which life itself was of no use to him—light? If they would enable the artist to "see" their great cities, he could promise that art would make them beautiful to look upon. Passing from the subject of their enemy, the chimney, the president glanced at the importance of the gutter as an aid to the cleanliness of streets and buildings, and incidentally pointed out that the appliances necessary for the sanitation of buildings were not irreconcilable with the laws of beauty. The aims of the sanitary engineer fell in with the aims of the architect; the gargoyle, primarily a gutter, was often shaped to add beauty to the fabric. The gargoyle was essentially the work of the architect, but it introduced the sculptor into the game. The reference to the sculptor brought the president to another branch of his subject. What, he asked, had become of the few works of sculpture that were supposed to adorn London? Did they not look as if they had suffered martyrdom at the hands of the gamins of the streets on the 5th of November? They were absolutely black with slime. Was that the best thing that could be done with them? The sculptor cried for help. Who would save him and his work from destruction? The president next alluded to the effects of the "tenebrous pall" of their cities on painting. Any great scheme for the development of national and historic painting in England was hopeless so long as the present state of things continued. England had taken a high position in the history of art. There had been two great periods of art—the Classic, which gave them the Parthenon, and the Gothic, which gave them Westminster Abbey. The mastery in these two schools, each perfect in itself and neither second to the other, belonged to the people of Greece and to the people of England. The race of men who built their cathedrals were equal in artistic capacity to the race of men who built the Acropolis of Athens. They, then, as Englishmen, had a past to build upon, and ought to have a hope for the future. A pressing question, however, was the establishment of right conditions. This was a question which the nation must answer through the medium of the sanitary reformer. He was confident that if this question were rightly answered, art would make the nation a rich return. After all was said and done, art was, and always must be, one of the environments of their lives, perpetually shaping them to fair or foul issues. Bad art meant much more than bad artists. It meant dreary surroundings in their dwellings, ignoble buildings in their streets, evil thoughts in their hearts. The converse of this, however, was true as regarded good art, and he earnestly appealed to his hearers to do all they could to assist in the removal of the obstacles which he had indicated as existing in the path of the artist, who should aspire to do noble and imperishable work.

A CHAPTER IN THE HISTORY OF POTTERY.*

THIS is the title of a descriptive account of the Twyford pottery industry. The Twyfords date, it is said, from the earliest period of Staffordshire pottery, even before the Wedgwoods. Mr. Thomas William Twyford met the requirements of the domestic engineer and architect with a true insight into the demands of the future, and the "chapter," which has been so pleasantly written by Mr. Joseph Hatton, illustrated by 25 photo. views of the various workshops and processes, will be welcomed by all who are interested in this important manufacture and its various developments. The iron and pottery district of Staffordshire has well been called the "backbone of England," and the Cliffe Vale Potteries of Twyfords holds a unique position among establishments. Mr. Hatton writes: "One need not be an artist to appreciate the sense of form and proportion which Mr. Twyford has imported into the architecture of his new

* Twyfords: A Chapter in the History of Pottery. By Joseph Hatton. London: J. Virtue and Co., Ltd., Ivy-lane.

kilns, that are an agreeable contrast to the haphazard and bulbous fashion of the ovens of the old school of pottery, with its ill-regulated shops and its disregard of the sanitary laws of health." In the plan and construction of those works every building and detail was arranged by Mr. Twyford. All the floors are of concrete, to prevent the heat of the lower stoves rising to the floors above; all walls between work-hops and stove are of brick for the same reason; each man has a window to himself, and every care has been taken to make Cliffe Vale a typical example of the application of the laws of health. We can only briefly refer to the book before us. Mr. Hatton sketches the history of pottery from the red ware of Egypt to the Italian faïence. The history of this particular pottery from the Elers Brothers, who first developed the manufacture of Staffordshire earthenware, followed up by Astbury and Twyford, who manufactured red porcelain and white pottery glazed with salt is interesting. Some very beautiful early Twyford teapots in the Hanley Museum are shown. The views illustrated begin with the Cliffe Vale Potteries, an important range of buildings, the fireclay bath-makers at work in their shop; next the fireclay lavatory makers, the fireclay kilns; potters making "Twycliffes." Then follow in succession views of the fireclay shop, the canal, the mill-house, the "slip"-house, model makers, the biscuit ovens and warehouse, printing shop, dipping house (in both of which women are employed), glost ovens, gilding and decorating shop, glost warehouse, &c. These represent sanitary workshops, for sanitary-ware is the great development at Cliffe Vale. Our readers all know the many types of basins, such as those of the "pedestal" class. Twyford's "Unitas" was the pioneer of the "Pedestal closet," a most important departure. It was exhibited at the Health Exhibition in 1886. The "wash-down" was next introduced, as illustrated by the "Deluge" pattern, one of the most perfect of its type. In 1894 the "Twycliffe" was introduced, a perfect basin that has never been surpassed, that is meant to supersede the "wash-out" and "wash-down" principles. Mr. Hatton's narrative deals with every process of the manufacture, and this part of his work is instructive and interesting. Our readers will find much that is of general concern in this book.

LIVERPOOL LANDING-STAGE EXTENSION.

At the meeting, on Monday night, of the Liverpool Engineering Society, Mr. John A. Brodie, city engineer, in the chair, Mr. Hugh Rogers, assistant to Mr. A. G. Lyster, the engineer-in-chief to the Mersey Dock Estate, read a paper on "Liverpool Landing-Stage Extension and Prince's Jetty." He explained that in extending the Prince's Stage to the northward, provision had to be made for landing cattle and cargo. Four decks had been provided, each with runways for cattle and stairs for the passengers, leading to the street level. The total length of the jetty was 400ft., and 67ft. wide. The main timbers of the structure were all greenheart, the uprights being 14in. square, and varying in length from 47ft. to 76ft. 8in. The cross-braces were 12in. by 6in., and the diagonal bracings 12in. by 12in. The joists of the deck were all of creasoted pitch-pine, and the deck was of greenheart, 3in. by 4in., spaced ½in. apart. At this point of the river the bed was of red sandstone rock of a hard, close nature, varying in depth from about 12ft. below old dock sill at the river wall to about 40ft. below the old dock sill on the face line of the stage. Along the river wall, and for a width of about 50ft., a bank of stones, boulders, and the like, had evidently been tipped, probably to protect the toe of the wall. The tide at this point was very strong, which had proved a serious point to be considered in the method to be adopted of obtaining a suitable foundation. The ordinary system of tide-work dams would have been most expensive, both on account of the tide and the depth of water, and also on account of the river traffic at this point. Screw piles were also considered, but as this entailed boring and blasting in order to get a hold for the piles, this system was given up. Mr. Lister finally decided to adopt some form of drill with which to form pockets in the rock, and then to grout the uprights into these pockets with concrete. It was also decided to form a hole large enough to take the pile itself, instead of trusting to the straps of the pile-shoe only, as in the case at Newcastle. For this purpose a drill was obtained which was capable of drilling a hole 25in. in diameter. After a trial of several months it was decided to abandon this drill and adopt other methods. Such a drill proved unsuitable for the rough work that it had to face, besides being a very expensive tool, both as to first cost and also for working. The next method adopted, and one which proved most successful, was jumping the holes down with chisels. The design of chisel finally adopted was a flat blade of wrought iron, with a cutting edge of steel about 6in. up, and fitted with detachable wings. The centre portion of this chisel was cut away for a width of 8½in., and about 18in. high, making the cutting surface 15½in., thus reducing very considerably the vibration caused by the blow, and the small core which was left standing was soon broken off with the jar of the blow. This chisel weighed about 10cwt., and was connected up with boring rods of different thicknesses, the lower rods having guides fitted to them for working in the centre of the pipes, and to prevent vibration as far as possible. This system did away with the time occupied in screwing down the pipes, as in the case of the diamond drill, for the pipes always followed the chisels down until the rock was hard enough not to fray away with the jar of the blow. As regarded the extension of the floating stage, the design of this length of 400ft. was practically the same as the old Prince's Stage, only slight alterations being made in the details. The new portion was carried by 27 pontoons, 23 of which were 80ft. long, by 10ft. wide, and 5ft. deep, the remaining four being 96ft. long, this extra length being provided to carry the foot of the bridge connecting the stage and jetty. These pontoons ran transversely to the stage, and carried the kelsons, which ran longitudinally. These kelsons were box girders composed of iron plates and angles, and were 4ft. 6in. in height, and across these again were the deck beams, also of iron. The pontoons were put together in Birkenhead. They were tested for tightness by being first filled with water, and afterwards by the external water pressure due to their own weight. Each pontoon had three watertight bulkheads. When completed the whole was towed across to Liverpool and put into position, and the connections with the old kelsons riveted up. As an experiment, and for a better foothold for horses, a strip 30ft. wide for the full length was laid with end-on blocks of creasoted pitchpine, 3in. wide and 3in. deep, the joints being run with pitch and fine gravel. The bridge connecting the stage and jetty was erected on the north end of the stage, and when completed was launched into position. The bearing for this bridge on the jetty was composed of a steel axle working on a cast-iron pivot and cast-iron bearing block, the stage bearing being two half-round cast-iron shoes working on cast-iron slides. The length of this bridge was 152ft. by 21ft. wide over all. The total length of the Liverpool Landing-stage was now 2,463ft., and the normal width 81ft. 4in., having a deck area of 23,098 square yards, or 4¾ acres. The whole stage was floated on 180 pontoons, varying in length from 60ft. to 120ft. It was approached by eight bridges, and kept in position by seven booms and 29 mooring chains (14 ebb chains and 15 flood chains). In addition to the seven bridges, there was a floating roadway 550ft. in length and 35ft. in width.

"LINCOLN CATHEDRAL," BY PETER DE WINT.

[WITH PHOTOLITHOGRAPHIC ILLUSTRATIONS.]

The de Wints were Dutchmen, and Peter the Painter was descended from a wealthy merchant of Amsterdam. His grandfather left the sleepy canals and slow counting-houses of Holland, and settled in New York, where the painter's father, Henry de Wint, was born. The elder de Wint, a merchant of ample means, sent his son to Leyden to study physic, and thence to London to take his degree. This having been accomplished, the doctor when he was 21 married an English lady of good family, but no means. As a result of this alliance, his rich parent withdrew his allowance, and left all his wealth to the eldest son. Dr. Henry de Wint, thus cut off without money, settled in Staffordshire, and gradually obtained a practice. Peter de Wint was his fourth son, and was born on January 21, 1781. The study of surgery ill-accorded with the artist's tastes, and therefore he was placed in 1802 with the engraver John Raphael Smith. Here he met the future Royal Academician and historical painter William Hilton, and a friendship was formed by the two lads that ended only in their death. About 1807 both pupils entered as students of the Royal Academy during the keepership of Fuseli. In 1810 de Wint first became an exhibitor, sending in two water-colours from Staffordshire, and one a view in the neighbouring county of Derbyshire. De Wint visited Hilton's home at Lincoln, where he found numberless subjects for his pencil, some of his best pictures being those of the noble cathedral there. De Wint found here, too, his wife, for he married Hilton's sister in 1810. This same year de Wint became an exhibitor with the Society of Water-Colour Painters, and eventually a member of that body, in whose exhibitions for 40 years his productions were to be seen. In nearly all his works breadth of handling in flat-washes gave great freshness and purity of colour. His art was neither realistic nor ideal; but he had a fine sense of colour, and truly appreciated the tints and harmonies of natural scenery. His figures are well placed, but individually look clumsy and feeble in their forms. They are, however, effective as to light and shade, leading the eye into the picture, and enhancing points of colour. De Wint died of heart-disease in 1849, and lies buried near his friend and brother-in-law in the ground of the Chapel Royal in the Savoy. In Lincoln Cathedral a handsome altar-tomb to the two friends, who loved each other in life and in death were not divided, was erected by Mrs. de Wint in memory of her husband and brother. The Exchequer Gate, which forms so charming and conspicuous a feature in the grouping of the Cathedral precincts at Lincoln, has been thought by some writers to be unfortunately located, inasmuch as it prevents an uninterruped view of the west front of this magnificent minster unless a bird's-eye is obtained from the Castle, such as that which we published from the brush of Frederick Mackenzie, the distinguished architectural draughtsman (b. 1787, d. 1854) in the Building News for March 6, 1896. Another view from the same eminent standpoint will be found drawn by Mr. Charles H. Holden in our pages for Sept. 21, 1894: but in this case the view is shown looking more towards the S.W. of the church, whereas Mackenzie's grander view takes in the Chapter-house and the N.W. side of the picture. To-day, the drawing which we have chosen has been reproduced specially for us from Peter de Wint's original water colour, now in the National Collection at South Kensington Museum. It represents Lincoln Cathedral, almost as it were in true elevation, and thus the Exchequer Gate is seen coming right across the road, and forming, as it does, the entrance to the Close. Whether this so-called obstruction may be considered rightly a disadvantage or not, must remain a matter of opinion. Anyhow, de Wint's delightful study emphasises the charm resulting from the fact that all the west front is not displayed to view at once. Besides the above-named illustrations of Lincoln Cathedral, it may be useful to mention some others which will be found in the Building News of the following dates:—General plan of minster and secular canons' buildings (by the late Mackenzie E. C. Walcott), February 8, 1878; plans of Cathedral, April 2, 1869, and February 6, 1891; Galilee porch and west front (W. H. Bidlake), November 26, 1886; Galilee porch and central tower from south-west (C. E. Mallows), February 6, 1891; rear of west façade from south-east, June 21, 1889; central tower and south-west transept (C. H. Holden), October 5, 1894; south porch (W. H. Wood), February 28, 1879; general view from south-east (Axel H. Haig), April 2, 1869; east end (C. H. Moore), March 31, 1890; cloister and north transept (W. H. Bidlake), February 6, 1891; north door to choir (John Begg), February 6, 1891; chapter-house (H. Harrington), October 19, 1883; Angel choir, interior (pencil sketch, by John Begg), February 6, 1891 (ditto from photograph), May 24, 1889; bay of choir (Sydney Vacher), February 27, 1880; Angel in choir J. P. Seddon), December 24, 1869; bosses from Angel choir (T. Fred Pennington), June 21, 1878; chancel gates (W. R. Lethaby), February 27, 1880; door of north choir transept, December 21, 1869; interior of north-west chapel (the late Sir G. Gilbert Scott), February 6, 1885; Bishop Russell's tomb in choir (measured drawing,

by Francis Hooper), April 7, 1882; Bishop Wordsworth's tomb [by Bodley and Garner] in retro-choir (from photograph), May 18, 1888; monument to Richard of Gainsborough, architect of Angel choir, in south walk of cloisters, September 7, 1891; details of staircase in cloisters (measured drawing, by J. Hutchings), October 26 1888; miserères (T. F. Pennington), April 23, 1880; bay of nave, October 23, 1885; eagle lectern (W. H. Bidlake), April 30, 1886; stone arcading (measured drawing, by H. G. Gamble), November 25, 1887; stone beam between west towers, October 28, 1887; 12th century window, November 29, 1878; and 13th-century mouldings, August 25, 1871.

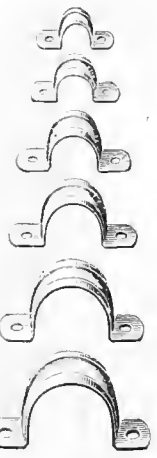
THE DOME OF THE CITY HALL, PHILADELPHIA.

An instructive and well-illustrated paper by Mr. Francis Schumann, on the "Metal Dome of the City Hall Tower, Philadelphia," appears in the *Proceedings* of the Engineers' Club of that city. Mr. Schumann gives an account of the construction and execution of this tower, which was designed by the late John McArthur, architect of the Public Buildings at Philadelphia, and carried out under Mr. Schumann's superintendence. The work was begun in 1890, and was completed in January, 1893. We gave an illustration of this tower some time since, showing the iron framing. The two upper stages have iselated columns in pairs. From the upper stage with segmental pediments, over the clock-dials on the four faces, springs the cupola, an elongated dome of octagon shape, crowned by a colossal statue of Penn. The height of the tower from the ground is 337ft. 4½in. It is of brick, faced with marble, about 70ft. square externally, and about 45ft. internally. The tower is enriched by several stages, cornices, balconies, and other ornamental details. Upon this tower of masonry the metal dome rises a further height of 210ft. 9in., making a total to top of statue of 548ft. 1½in., an altitude which exceeds most of the great historic examples of this country or America. A few details are given that may be of interest. The total estimated weight of tower extending 15ft. below the ground to top of concrete foundations is 62,768 tons; the concrete is 8½ft. thick, and covers an area of 7,150sq.ft., and weighs 4,000 tons. For a height of 90ft. the tower is attached to the north wing of building, and is bonded to it. The upper clock story, which rises 60ft. into the dome, has a clock dial on each face 25ft. in diameter, and to the centre of dials it is 361ft. 3in. above the ground level. The dome has a slight curve, and is enriched by angle ribs, cornices, dormers, and festoons. About 145ft. above the masonry of tower the floor of balcony is reached, the highest part accessible by means of stairs and elevators, and from it the top of the Penn statue is 65ft. 10in. By means of ladders through the "tree stump," which forms a central support to the statue, the visitor may enter into the body of the figure itself, and may also put his head through the crown of Penn's hat. The four pediments of the tower below is surmounted by bronze eagles, and allegerical bronze groups represent the four epochs in the early history of Pennsylvania. The shell of dome is electro-plated cast iron, the louvred panels being of sheet steel.

Describing the structural part of dome, which is of wrought iron and steel, the form is an octagonal prism to the height of clock-story, the remainder an octagonal pyramid ending with the steel apex cap supporting the stone. The octagon is formed of meridional columns or chords at the corners, and these are supported on four box girders, placed diagonally across the masonry tower, bedded in cast-iron plates about one-third of the length of girder. This brings the weight of dome through the columns to the clear ends of the girders, which act as cantilevers, thence to the solid portions of masonry, thus clearing the window-openings. These girders are bolted to the masonry by two 3in. diameter anchor-rods to each girder. The rods extend down 70ft. to anchor-plates imbedded in wall. The columns are braced together by horizontal struts dividing the dome into ten tiers of bays, each panel intersected by diagonal tie rods, these made to resist both tension and compression on the upper tiers. The apex cap of steel is an octagonal tube of steel plates and angles, upon which the statue is bolted. The author describes the several floors which divide the dome. There are four floors perforated for stair and elevator. Considerable skill has been shown in the iron framing supporting the 24-foot statues at the corners. The segmental pediments, bronze group parts, and the details are illustrated by several drawings of sections of the framing, reproduced by photegraphic means and by views of the progress of work. The colossal figure of Penn and diagrams of strains are shown also on several sheets, and the dimensions and weight of the framework are given. The paper is a valuable contribution to the literature of structural ironwork of this description.

WROUGHT STEEL PIPE-CLIPS.

Messrs. Charles Winn and Co., of Birmingham, are making bright tinned pipe-clips, which will be found light and strong.



They are turned out in wrought steel, and are quite a novelty, and will, we think, speedily take the place of the cumbersome and more expensive means of fixing lead and other pipes at present in use.

THE SCALING OF PAINT.

In a previous article the causation of blisters in paint on woodwork has been fully considered; in the present article it is proposed to point out the cause of paint scaling off from the surface of wood, iron, plaster, &c. Let us first consider the scaling of paint from wood. Besides the cause mentioned in the article above referred to—viz., the elimination of glycerine from the oil vehicle in the paint; there is another frequent cause of water blisters forming beneath a coat of paint that is laid on woodwork. This water may owe its origin to several causes:—(*a*) it may be the natural sap inherently present in green wood (*i.e.*, wood not sufficiently dried before working); (*b*) it may be due to the water being absorbed from external causes into the pores by the wood itself; as, for instance, the ends of the woodwork—which are seldom painted over—may be brought into close contact with seme damp material, whereby the water is absorbed in the pores of the wood by capillary attraction. Take, for example, the case of skirtiog boards or the boarding of a wooden partition. Only the face of the skirting-boards receives a coat of paint. The bottom edge is left entirely unprotected, and so likewise are the ends of the skirting. Now, both bottom edge and ends may rest directly against damp brickwork or bricks or tiles which are of a perous quality. Consequently, water will be readily imbibed by such wood. (A great mistake is made in not painting both ends and edges of skirting-boards.) (*c*) Water may also have been absorbed by the wood through its exterior surface owing to accidentally becoming wet, and the water having been driven into the interior of the wood by it being subjected to heat, such as the sun's rays or the heat of a fire in a room. From whatever cause the presence of water may be due, it will prove fatal to the permanent adherence of any coat of paint. For this reason, when such painted wood is subjected to the sun's rays or any other source of heat, the water present in the woody fibre will be gathered up into large patches, according to its freedom of traversing the fibre of the wood. The fibre around "knots," &c., in wood is always denser and harder than other parts, and consequently prevents a free travelling of the watery particles. These large accumulations of water will be drawn to the surface of the wood; but as they cannot escape through the hard skin of paint they will press the paint away from the wood, or from the primary coat, and cause it to bulge up in large patches. When the source of heat diminishes in temperature, the water will be reabsorbed into the woody fibre; but the bulged-up paint will remain, and in time become dry and brittle—so brittle, in fact, that the slightest jar will cause it to scale off the wood. If the under-side (that side which has been next to the woodwerk) be closely examined, it will be noticed that it has a rough surface. Such rugosity affords evidence of the tenacity with which it has clung to the wood itself—showing, in fact, that the paint skin has been forced away from the wood by a great pressure, the surface of the paint, in fact, conforming to the rugosity of the wood's surface. When we remember that paint which has been exposed for an hour or two under a severe sun is so hot as to scarcely bear touching with the hand, we can understand that any water which has been gathered beneath such paint will have been converted into steam, or, at least, made so hot as to exert a considerable expansive force. If the water-blisters are due to the excessive amount of water that has been imbibed by the wood, but which has not been subjected to excessive temperature, then the paint will be rendered non-adherent to the woodwork by the presence of the excessive water in the pores of the wood: consequently the paint will not be bulged up, but will lie flat. As the water is dried out of the wood in the course of time, the skin of paint will dry and harden, but be non-adherent to the wood, until at last it is so brittle that it will not bear its own weight, but flake off at the slightest touch.

In the article already referred to, it was pointed out how very unprotective the primary coat is. Such a thin coat of red-lead, turps, and oil as is usually applied is not sufficiently thick to prevent the water penetrating it, and reaching the second coat of paint; consequently the underneath side of the scales of paint will show where they have been riven from the priming coat. In some few cases it will be noticed that the under side of the flaked-off paint carries the priming coat also. Such is due to the primary coat having been too thick to be penetrated by the water, and consequently the priming coat has been dislodged from adherence to the wood fibre, owing to the aqueous particles present in the wood. A suggested remedy is to saturate the pores of the wood with a spirituous solution of wax of some sort, se as to fill the woody fibre with a waterproof substance whereby the interstices in the wood fibre cannot hold watery particles. Such a spirituous solution could be made by dissolving stearine or paraffin wax in benzine, and applying same to the wood before laying on the priming coat. The wood should be then subjected to a source of heat sufficiently strong to drive the wax into the fibre, but not entirely away from the surface. A skin of wax on the wood surface that was sufficiently thin to permit the paint coming in close contact with the woody fibre would be a good preventive of the formation of watery blisters under the paint. But, unfortunately, even this remedy would not be permanent if the painted wood were subjected to the fierce heat of the sun or a stove-fire, for the wax would be either driven too far into the heart of the wood or else driven up under the skin of paint, and consequently such wax would form a buffer between the wood and paint, that would not permit the paint to adhere to the wood. Another remedy would be to paint the wood before placing it *in situ*, particularly the ends, so as to prevent the absorption of water from extraneous sources.

The scaling of paint from iron is due to the formation of rust on the surface of the iron, such rust being engendered by the penetration of moisture through the coat of paint while still moist, or else by the elimination of the glycerine from the oil-vehicle in the paint, as already pointed out in the article above referred to. The rusting of the iron may have been started before it was painted: and if so, the rusting process will proceed, and progress over the metallic surface until it spreads all under the paint, and separates the same from the iron.

The remedy is obvious—viz., carefully scrutinise the surface of the iron before proceeding to paint it, and if there be the slightest appearance of rust, if only in spots, carefully scrape such parts of the metal until the grey iron beneath is exposed; then immediately lay on a coat of paint—red oxide of lead, or else a solution of paraffin

wax in benzine—a very thin solution, so as not to put too thick a skin of wax on the iron, or the paint will not adhere. If the metal is at all scaly, rust may be present under such scales; it will be best then to "pickle" the iron—that is, brush it over with some sulphuric acid solution; then kill the chemical action of this acid by brushing a solution of soda or ammonia on the iron, and finally washing away all traces of the chemicals by means of clean cold water; then thoroughly dry the iron rapidly by subjecting it to a hot temperature, and before it becomes cold, proceed to give a coat of red lead or else paint.

The scaling of paint from plaster is due to several causes. Plaster is of necessity porous, and extremely susceptible to dampness and the imbibition of moisture. The water thus absorbed may be sucked into the interior of the plaster, leaving the exterior surface dry; consequently, when a coat of paint is spread on such plaster the imprisoned water is completely prevented from escaping. But when heat from any source reaches the painted plaster, such imprisoned water will be drawn to the surface just beneath the paint, and by alternations of heat and cold it will fluctuate between the surface and interior of the plaster until the moisture has been all used up in chemically or mechanically combining with the lime salts of the plaster; such combination will be productive of crystallisation of the lime, and after a time the crystals will become reduced to a condition of dry powder, and as a consequence beneath the layer of paint there will be a pulverulent powdery mass to which the paint cannot adhere. As a result, such paint flakes off. Apart from the imbibition of moisture from the surface of the plaster, moisture may also be absorbed from the foundation surface on which such plaster is laid. Thus, bricks are porous, and if they imbibe damp from any source, such dampness will invariably reach the plaster, to be absorbed thereby, as indicated. The remedy for preventing scaling of paint from plaster is to saturate the plaster with a solution of wax in some volatile hydrocarbon, such as naphtha, paraffin, or benzine, so as to fill up the interstices in the plaster with a water-repelling substance. By such a course, water will not be imbibed either from the surface or by capillary attraction. To render the surface suitable for painting on, the wax should be well driven into the interior of the plaster by holding a brazier of coal, or some other source of heat, some little distance from the surface of the plaster. Allow the hot plaster to cool before proceeding to paint it. If the surface of the plaster show any signs of being powdery, such powder should be well scraped off before proceeding to wash it with a solution of wax.

A cheaper method of rendering the plaster non-porous is to well saturate it with a solution of hot soap and water in which rosin has been dissolved; thus, dissolve common rosin in a solution of caustic or carbonate soda by boiling, and then mix this fluid with a strong solution of soap and water—about ½lb. of soap per gallon of water; well brush this into the plaster with a big brush, using it hot. Another plan is to saturate the plaster with soap-water, and when that has partially dried, lay on a solution of sulphate of iron (green copperas), sulphate of copper (blue copperas), or sulphate of alum and potash (common alum); the effect of any one of these chemicals is to convert the soap into a sebate of the metal (iron, copper, or aluminium, as the case may be), which is insoluble in water; consequently, by this means, the pores of the plaster are filled up with a water-repellent material, and thereby the plaster becomes rendered proof against the imbibition of water from any source. Another process for rendering plaster proof against absorption of water is to saturate it with a solution of iron, copper, or alumina sebate in turpentine. Such sebate is made thus: Make a strong syrupy solution of soap in water, and also a saturated solution of either of the above-named chemicals (i.e., green or blue copperas or alum) in water; mix the two solutions and collect the flocculent precipitate that falls down, wash this precipitate with water once or twice, and then dry it, and when dry or free from moisture dissolve it in hot oil of turpentine. This is the fluid required for saturating the plaster with. It will render the plaster as hard and endurable as stone, and gives a splendid surface for painting on.

The last three processes can be used equally as well on brick, stone, tiles, and any porous materials as on plaster. They are much superior to silicate paints, which only disintegrate in course of time and crumble off. H. C. S.

BRIGHTON MASTER BUILDERS' ASSOCIATION.

ON April 19, the annual dinner of the Association of Master Builders was held at the Clarence Rooms, Hotel Metropole. The chairman (Alderman Botting, J.P.) presided, and there were also present the mayor (Alderman Sir John Blaker), Alderman Davy, J.P., Mr. G. S. Godfree, Mr. Wormald, Councillor Wilson, Messrs. Botting, Mr. Patching, Mr. Lynn, Mr. Wright, Mr. Brown, Mr. Pearce, Mr. F. M. Cox, Councillor Holloway, Mr. Sattin, Mr. Evershed, Messrs. Cox, Mr. Carpenter, Mr. Wilmer, Mr. Duke, Messrs. Garrett, Mr. Winter, Mr. Emery (secretary), Mr. G. Parsons, Mr. G. Parsons, jun., Mr. Morfee, and Mr. E. Hunter. About 60 sat down to dinner. After the loyal toasts, Mr. G. S. Godfree proposed "The Mayor and Corporation," and in doing so congratulated the association upon having present not only the Mayor, but past Mayors, in the Chairman and Alderman Davey.

THE LARGEST TRADE IN BRIGHTON.

Alderman Davey submitted the toast of the evening, "The Association of Master Builders." He said that under the existing condition of things it seemed to be necessary that combinations should exist among all trades and professions. Their own motto was "Defence, not defiance." He only wished some tribunal could be formed by which all disputes between masters and men could be amicably settled without recourse to strikes, which not only brought a great deal of misery upon thousands of men and their families, but great loss to the nation. The building trade was the largest in Brighton, and had done more than any other to make the town what it was now. As a health-resort, Brighton depended a great deal upon what the builders could do to make it an attractive town. Of course, there were shoddy men in their profession, as in many others; but at the same time, their number included splendid men of business. Among them were some of his best personal friends. Nothing had occurred in the trade during the past few years but what the trade committee had been able to settle, and he hoped that would long continue, to the advantage of both employer and employed. Long might the association continue to do its excellent work. The chairman, as they knew, took very great interest in the association, and did all he could to keep the masters together to do the best they could for the employés as well as employers. In acknowledging the toast, the chairman pointed out that the extension of the town depended absolutely upon those who placed their money in bricks-and-mortar, so that provision might be made for those who wished to visit and settle in the town. Their association had had a very successful year, having kept up its membership, and increased the subscription list. In every way it had been a success, and that of itself was a proof that they were doing the right thing to watch the interests of the building trade. When he said that, he meant for the benefit of the employés quite as much as the employers, and he believed the society would continue to carry on the good work it had taken in hand. In every case they tried to avoid anything that was likely to create friction. There were one or two complimentary toasts, the speeches being interspersed with songs.

ARCHITECTS' LICENSES IN ILLINOIS.

THE Chicago correspondent of the *American Architect* writes to that journal: It may be of interest to review the situation here in Chicago relative to the licensing of architects and the work which the board appointed for the purpose has already accomplished. After this board had been appointed by the Governor it found itself in rather a curious position—a body with a good deal of work before it, and not one cent of money in its possession with which to accomplish such work. Fortunately, one of our well-known architects, on going abroad, placed his office at the disposal of the board, so one difficulty was removed. Stationery and stamps were the next most essential things in the list of equipments, and these were temporarily furnished by the individual members of the board itself. As soon as the actual licensing was begun, a fund for running the office was established, till, at present, the board has a balance of about 13,000dol. As may be remembered, it was planned that, previous to January, 1898, all persons who could show proof that they were practising architects should, upon the payment of 25dol., be granted a license to continue in such practice. To draw the line, especially in several of the smaller towns, between contractor and architect has been the one difficult feature of this part of the work. The accepted definition of an architect for this especial case seems to have been: A man who makes plans for buildings which he does not build himself. In most cases where there was any doubt about the applicant's living up to such definition, he has been given the benefit of the doubt. After the first of January the real work of the board began, as all applicants for license then had to pass the regular examination, the fee being no longer 25dol., but 40dol. So far, the best examination has been passed by a man who has worked up to the profession by way of the trades; the second-best test was stood by a male graduate of one of the European schools; and the third by a female graduate of an Eastern technical school. At the present time the number of licensed architects in the city is 519; in Cook County outside of Chicago, 13; in Illinois, 154. Nineteen licenses have been granted to architects from other States. The total number of applications for licenses was 793, while since January 1st the number of applications for examinations has been only 25. It was decided that in case of the application for a license from any reputable architect from another State it should be granted after the payment of the fee of 40dol., the examination to be on plans, made and submitted by him, of some considerable building actually constructed. With already a considerable balance on hand, and the likelihood of a continual small revenue yearly from the licenses, the question of the use of such funds for the advancement of the profession will naturally arise. At present the matter stands that whatever there is in excess of 2,500dol. shall be turned over to the State treasury "for the credit of the board," which appears somewhat vague. There will occasionally be small legal expenses in connection with unprofessional practice, one of the few cases where the board can itself discipline being where a licensed practitioner shall be guilty of unprofessional practice. In case of an architect failing to use his seal on his drawings the board may revoke his license, but all other prosecutions for offences against the law must be undertaken by outsiders. All this work has been accomplished under the State law; but the matter is now being discussed of a revision of the city ordinance requiring that all drawings shall be made by licensed architects, with a few insignificant exceptions.

CHIPS.

The partnership hitherto subsisting between H. E. Kirk, J. A. Knight, and Chatwin, under the style of Kirk, Knight, and Co., contractors and builders, Sleaford, has been dissolved.

In consequence of a strike which broke out at Copenhagen on Thursday in last week among house painters and men employed at a number of iron foundries, the employers' union has decided to enforce a general lock-out of all trade unionists unless the strike is settled by negotiations or arbitration. Thirty thousand men are affected.

Easter week at the Mart, Tokenhouse-yard, was, as usual, dull. Little was on offer save brick and mortar investments, and these, as usual, met with a ready sale, and, in instances, at capital prices, some freehold shops near the Angel, at Islington, exciting keen competition. The returns for the week amounted to £28,785, as compared with £62,605 for the corresponding period in last year, which was not, however, a holiday week.

The design of Messrs. Cheers and Smith has been selected in a competition for a new board school to be built, at a cost of £6,000, in Accrington-road, Blackburn. Mr. A. Boyle, of Manchester, was the assessor, and 13 sets of plans were submitted.

Particulars of a proposal of the Newport, Mon., Town Council to borrow £30,000 for the construction of a new road to facilitate the development of the eastern side of the Usk and the approach to the Liswerry district were laid before Mr. W. D. Ducat, inspector under the Local Government Board, on Thursday, at Newport. The town clerk said that about one mile and a half of new road, known as Corporation-road, had already been laid down, while there remained still another mile or thereabouts to be constructed. It was also proposed to connect the Liswerry district to the Corporation-road by a 40ft. road, at a total cost of £3,950, of which the owners of contiguous land had agreed to contribute £1,685.

OBITUARY.

Mr. Augustus Laver, formerly a well-known architect in extensive practice in the United States and Canada, died at his home in Flood's Building, San Francisco, a fortnight ago. He first became conspicuous as the designer of the Canadian Parliament House, at Ottawa. This was hardly completed when he won, in competition, and in connection with Mr. Fuller, of Albany, the commission for the New York State Capitol. A great deal of work had been done in carrying out their design when the State Government suddenly decided to take the building out of Messrs. Fuller and Laver's hands, and confide it to an artistic triumvirate, composed of Messrs. Richardson, Eidlitz, and Olmsted. Messrs. Richardson and Eidlitz took charge of the building, while Messrs. Fuller and Laver removed to San Francisco, where they had won, also in competition, and eventually carried out, the commission for a new city-hall. Besides this building, Mr. Laver designed the great Flood mansion, at Menlo Park, together with another, for Mr. Coleman, in the same neighbourhood, as well as the Flood Mission, and many less important structures. He had been an honorary corresponding member of the Royal Institute of British Architects since 1879.

Mr. William M. Watson, for very many years county surveyor of Bedfordshire, died on Tuesday last at his residence, Wren Park, Shefford, Beds, at the advanced age of 88 years. The funeral will take place at Henlow Church on Monday afternoon next.

The death is announced of Mr. Walter Davies, architect and surveyor, of 6, Waterloo-place, S.W., and 91, Burnt Ash-road, Lee, Kent. Mr. Davies was elected a member of the Society of Architects in 1887, and was at one time a valued member of its council; he had been a Fellow of the Surveyors' Institution since November, 1891.

The death occurred, after a long illness, on Wednesday in last week at his residence, 182, Cromwell-road, S.W., of Mr. Robert Collier Driver, F.S.I. The deceased gentleman, who was in his 82nd year, was for many years associated with the well-known firm of Messrs. Driver, auctioneers and surveyors, 41, Whitehall. He became the sole surviving partner in 1855, and, after a most successful career, retired from active interest in the business in 1876. He was engaged in all the great Metropolitan improvements. He purchased the land for the London, Brighton, and South Coast Railway Main Line, and a large portion of that for the Great Western Railway. As an auctioneer, Mr. Driver had at one time one of the largest practices in the United Kingdom. From about 1860 to 1875 his sales closely approximated one million sterling. He was also engaged in the development of many important building estates in the suburbs of London. Mr. Driver was one of the founders of the Surveyors' Institution, his name being No. 9 on the roll of membership, and a few years since he served as president. He was also past master of the Clothworkers Company, and a member of the Commission of Lieutenancy for the city of London. The funeral took place on Tuesday morning at St. Jude's Church, South Kensington.

The death occurred at Paris on Tuesday, at the age of 72, of the painter Gustave Moreau, the French Pre-Raphaelite. Moreau, who has died in the little house in the Rue La Rochefoucauld where he was born, was the son of an architect and early entered the Ecole des Beaux Arts, where he was a pupil of Picot. His first appearance at the Salon was in 1852 with a *Pietà*, and in the following year he exhibited the large canvas "An Episode of the Song of Solomon," now in the Museum of Dijon. His "CEdipus and the Sphinx" was first seen in the Salon of 1864. Among others of his pictures are "Orpheus torn by the Mænads" (Luxembourg), "Diomedes devoured by his Horses," and "Salome." He was elected a member of the Academy of Fine Arts in 1888, and became professor at the Ecole des Beaux Arts in 1892.

PROFESSIONAL AND TRADE SOCIETIES.

Bristol Society of Architects.—The annual general meeting of this society was held at the Fine Arts Academy, Queen's-road, on Monday last, Mr. F. W. Wills in the chair. The president, Mr. W. L. Bernard, F.R.I.B.A., and vice-presidents, Messrs. Joseph Wood and W. V. Gough, were re-elected, and a vote of thanks was accorded to the retiring hon. sec., Mr. W. S. Skinner. Mr. H. Dare Bryan was elected hon. sec. for the ensuing session.

The Civil and Mechanical Engineers' Society.—A meeting of the above society was held at the Hotel Victoria, Charing Cross, on April 14, Mr. B. B. Dodley, vice-president, in the chair, the paper for discussion being "Pipes and Pipe-Laying," by Mr. Alfred Hanssen. The author first drew attention to the largeness of the subject, but explained that he would beg to limit the paper to cast-iron and stoneware pipes, and drew attention to the fact that to a great extent the health of the town and country depended on the use of proper pipes, several specimens of pipes being exhibited, amongst others a very fine specimen of a cast-iron pipe that had been made over 100 years. One of the most important points in pipe-laying being the proper jointing of two pipes, several methods were discussed, and also the various methods used in different countries.

Liverpool Architectural Society.—In commemoration of the 50th anniversary of this society a dinner was held on Monday evening in the Walker Art Gallery, Liverpool. Mr. W. E. Willink (president) occupied the chair, and a large number of members partook of a repast in the room devoted to exhibition of the work of the Schools of Art, Architecture, and Technology. Professor F. M. Simpson submitted the toast of "The Royal Institute of British Architects and the London Architectural Association." He said the Association had been particularly successful in the direction of giving great assistance to young architects. Mr. E. W. Mountford (past president L.A.A.), in replying, attributed the success of the Institute of British Architects largely to its system of examinations. Liverpool, he continued, was to be congratulated upon the existence of its School of Architecture and Applied Arts, and partly on the fact that the management of affairs was in the hands of Professor Simpson, Mr. Allen, and Mr. Anning Bell. The city possessed some fine buildings, St. George's Hall, their centrepiece, being perhaps the finest in England. It seemed to him, moreover, that there were men in Liverpool who were prepared to pay for architecture, which was a great thing. Unfortunately, architects suffered from this disadvantage, which painters and sculptors did not experience—they were limited by the means at their disposal, and unless they had wealthy men, with the will to spend money, they could not produce fine buildings. He had been delighted to see the other day in the papers a reference to the fact that in some Liverpool buildings the committee had accepted a tender which came to something like double the architect's estimate. That piece of fortune had never happened to him, but it was a very good thing. It was distinctly in favour of the Liverpool architects. Mr. Hampden W. Pratt, president of the Architectural Association, in responding for that body, said it might be stated with perfect truth that the architects of the future were for the greater part those who had passed, or would pass, through the ranks of the Architectural Association. At the present time, when they were being, as it were, assailed by boards of technical education, which were to some extent their competitors and rivals, they endeavoured, as an association, to hold their own, and they did so on the ground that, however competent these technical boards and classes and institutes might be, they could not, and never would, take the position that the Architectural Association had been able to, and still could take in regard to the profession. One of the chief aims of the association had been mutual help, and until the last seven years it had been conducted upon voluntary principles. Within the period named they had been obliged to advance with the times, and they had a large number of paid teachers in their classes, with the result that their system of education had been more perfect than before. Their association was able to offer advantages which no technical school or board could offer. Their influence did not merely extend throughout the whole of this country, but abroad, the membership, which was the largest in the history of the association, being over 1,200. They had existed not for their own individual benefit, but for the art which they loved and were privileged to represent. Mr. H. Hartley, in proposing "The Allied Societies," described the streets of Manchester as furnishing food for melancholy. Mr. J. Ely (president of the Manchester Architectural Society) acknowledged the toast, without comment upon Mr. Hartley's caustic allusion to Mancunian architecture. Mr. T. D. Barry, as one of the original founders, appropriately proposed the toast of "The Liverpool Architectural Society," his speech being full of reminiscence. The president, in reply, described the architectural profession as being, in spite of its responsibilities, one full of pleasures of a varied description. Courteous reference was subsequently made to "The Guests" and "The President."

CHIPS.

The members' soirée and smoking concert of the Architectural Association will be held on Friday in next week at the Café Monico, Piccadilly-circus, W.

The Treasury has taken advantage, the *Athenæum* says, of the retirement of Mr. C. L. Eastlake from the National Gallery to effect a saving in the salary of his successor, Mr. H. H. Turner, who, instead of Mr. Eastlake's £875, is to have only £350 a year. The post is thus brought on a level with that of the Keeper of the Millbank Gallery.

The Chancellor of the Exchequer unveiled, on Monday, a white marble bust of the late Lord Randolph Churchill, which has been placed almost opposite that of the late Mr. W. H. Smith in the corridor of the members' staircase leading from the Lobby of the House of Commons. The bust is the work of Mr. Waldo Story.

On Saturday afternoon the Earl of Crewe laid the foundation-stone of a new chancel which is being added to Christ Church, Crewe.

A new peal of six bells has been dedicated at Mistley Church, Essex. The peal weighs 46½cwt., and has been cast by Messrs. Bowell and Son, of Ipswich.

The Manchester Corporation are carrying out, under Parliamentary powers, an important street improvement in Shudehill, which will be widened so as to allow of a double line of tramways. At the same time the spar thoroughfare of Mayo-street will be reduced to 36ft. and carried into Corporation-street, thus forming a new approach to the market from Victoria Station.

At Plymouth a local government board inquiry has been held into an application by the corporation for sanction to borrow £22,306 for the erection of a museum and art gallery, £550 for street improvements, £2,500 for public lighting, £15,800 for the reconstruction of sewers and repairing of streets, and £1,340 for the purchase and adaptation of premises for the purpose of a fire and police station.

During a thunderstorm on Saturday afternoon the parish church of Swanton Morley, four miles north-east of Dereham, was struck by lightning. The south-east angle of the parapet of the lofty tower was shattered, and portions of the masonry fell on to the nave and south aisle roofs, causing considerable damage. The clock was also struck, the electric fluid severing the steel wire rope which carries the heavy weights, and these in consequence fell into the church and broke in pieces the massive oak chest containing the documents of the parish. The building was not injured by lightning, and neither were any of the fittings.

At a meeting of Aberdeen Town Council on Monday the finance committee recommended the restoration and retention of Greyfriars' Church as a place of worship. The committee, having found it to be an absolute condition of the donor of £10,000 that the church should be retained, were forced to consider what could be done to secure this money, and at the same time conserve the public interest. On condition of getting the £10,000, the University would also obtain £20,000 from the Government. After discussion, the report was adopted.

The Perth Police Commission adopted on Monday a report by Messrs. Blyth and Westland on the offers for the new bridge across the Tay, recommending the acceptance of estimates for the erection of the bridge at a cost of nearly £20,000. The estimates accepted are nearly double what was anticipated when the idea of the bridge was first mooted, but the bridge will be widened 10ft. from that originally proposed.

The annual spring holiday excursion of the Edinburgh Association of Science and Art took place on Monday, when some 200 of the members visited the Atlas Works in Springburn and the power station of the Glasgow District Subway Company, Scotland-street, South Side, Glasgow.

Lincoln Cathedral.—Abbey Mansions, Victoria Street, S.W.—First and Second Premiated Designs for Battersea Public Baths.—The Porch, Lower Court Farm, Upper Langford, Somersetshire.

Our Illustrations.

"LINCOLN CATHEDRAL," BY PETER DE WINT.

(For description, see p. 559.)

ABBEY MANSIONS, WESTMINSTER.

This block of buildings, situated at the corner of Victoria-street and Orchard-street, Westminster, has been erected for Her Majesty's Office of Works, comprising nine floors and about 300 rooms to be used as Government offices. The building is erected in Portland stone with red brick facings, and is fireproof construction throughout. The buildings have been erected and carried out by Mr. W. R. Rickard, contractor, City-road, at a cost of £95,000, from the designs and under the superintendence of the architect, Mr. Chas. J. Chirney Pawley, 2, Prince's Mansions, Victoria-street. The red brick facings are by Messrs. T. Lawrence and Sons, of Bracknell, Berks. The lift is by Messrs. Waygood and Co., Falmouth-road, Great Dover-street.

BATTERSEA PUBLIC BATHS AND WASHHOUSES.

The design illustrated was awarded the first premium in the recent public competition, and has since been adopted by the vestry. The conditions of the competition laid great stress on the importance of so arranging the building as to render it capable of easy extension, its position being left to the judgment of the several competitors. In order, therefore, to meet this requirement, a portion of the site—that between the public washhouse and the men's slipper baths—is left open, so that either or all of these departments might be enlarged; and the reading room is placed on the ground floor, so that the women's slipper-baths might be extended by occupying the space so utilised if required, the reading-room being then removed to the first floor. The principal entrances are placed in the Battersea Park-road frontage, with separate approaches to the men's baths and swimming-bath and to the women's baths respectively. These entrances are divided by a ticket-office and screen, and each has its entrance-hall and lobby. The slipper baths are provided with separate waiting-rooms and attendant's box, so arranged that one official can supervise each dual set of baths. Centrally placed is the superintendent's office, with private entrance and staircase leading to the committee-room and the private apartments on the first floor, and also to the establishment laundry, and to the public laundry by an official corridor. Special attention has been paid to adopting the swimming-bath for purposes of entertainment, ample entrances and exits being provided, both from the ground floor and also from the galleries. The public washhouse and laundry are entered from Cringle-street, and this department has entrance hall and corridor, waiting-room, bonnet-room, &c., and a crèche. There will be 67 washing compartments and drying-horses. The house laundry is placed on the first floor over a portion of the men's baths, and in direct communication with the matron's apartments. A lift is provided in connection with it. The lighting will be effected by lantern lights, and artificially by electric light. Mr. Francis J. Smith, F.R.I.B.A., of 17B, Great George-street, Westminster, is the architect, and it is the intention of the vestry to erect the building by their Works Department, the efficiency of which has recently been greatly increased by the erection of extensive workshops from the designs and under the superintendence of Mr. Pilditch, the surveyor to the vestry.

SECOND PREMIATED DESIGN FOR THE NEW BATTERSEA BATHS.

In this design the whole of the public baths and washhouses, with all adjuncts, are placed on the ground floor, leaving ample room for extension; the towel laundry and engineer's department being placed in the basement well lighted by areas. Towel-shoots are placed in each attendant's room in connection with towel laundry, and a towel lift in connection with pay-box. The committee room and superintendent's residence is on the first floor, approached by a staircase leading out of the entrance-hall; the accommodation consists of sitting-room, kitchen, scullery, larder, w.c., and three bedrooms. Lavatories are provided for the use of the committee. A coal-lift communicates with basement. The public entrances to baths are in Battersea Park-road, one entrance for men and for women, with separate vestibules leading to large entrance halls, the ticket-office and superintendent's room being placed centrally. If a separate office was required for superintendent, it would be placed where shown. The women's entrance leads from hall direct into first and second-class women's slipper baths. The men's entrance leads from hall direct into first and second-class slipper baths and to swimming-bath. The swimming-bath is entered through large hall. Two swimmers' clubrooms are placed close to entrance; each room has a w.c. and lavatories. The bath is entered at the deep end, having a movable diving-board, hot and cold shower spray, dressing-boxes along two sides and one end, a stepped gallery 9ft. wide runs round two sides and one end, the floor being at the angle of 45°. The gallery is approached by well-lighted staircases. Lavatory and w.c.'s are provided for on landings; the attendant's room adjoins the entrance and has a towel shoot; w.c.'s and urinals are placed at side of bath, well ventilated into large area. A foot-washing bath is also provided. It being intended that the bath should be used as a public hall for entertainments, a separate entrance is placed in Battersea Park-road, with large vestibule, thus obviating the necessity for closing any portion of the baths when entertainments are being given: the two clubrooms would be used as cloak-rooms. An emergency exit from gallery is shown, leading into Cringle-street. Emergency exits from ground floor are also shown in Cringle-street, in order to comply with L.C.C. regulations. Two dressing-rooms are placed at stage end of bath for the use of artistes, each having a lavatory and w.c. The dressing-boxes are all made collapsible and fit into the bays forming panelled dado. The whole area of bath will be covered with a pitch-pine floor with platform at end. Ample storage is provided in basement for movable platform, chairs, &c. The six men's first-class slipper baths, thirty-two second-class ditto, three women's first-class ditto, and nine second-class ditto, are each provided with large waiting-rooms: the attendants' rooms having towel-shoots being so placed as to allow of the one attendant supervising each department. The men's baths have w.c.'s, lavatories, and urinal; the women's, w.c.'s and lavatories, all ventilated into areas. The baths are all top-lighted and ventilated. The public washhouse and laundry is approached from Cringle-street. The pay-office is placed centrally, and has turnstiles. On the left of entrance is placed the waiting-room, and immediately opposite the crèche, having a fireplace and lavatory and w.c. A corridor leads out of waiting-room to washhouse past the w.c.'s, and room for temporary storage of wearing apparel. The washhouse contains 72 washing stalls, each 3ft. 6in. wide, with iron fittings for hot and cold water and steam. These washers are so placed that a woman may particularly observe her own drying-horse; 48 drying-horses are placed at one side and 24 opposite, each 6ft. long, having a steam-heated battery drawing air from engine-room and ironing-room, and driving heated air in through the closets at a temperature of 130°, thus insuring rapid drying, ventilating shafts being provided at back of closets. Five centrifugal wringers are conveniently placed at the end of washing-stalls. The ironing-room adjoins and contains two box mangles, and having ironing stoves and tabling. A door leads to room for temporary storage of wearing apparel, and also to corridor past crèche, and so into street, thus avoiding the necessity for women re-entering the washhouse. The estimated cost was £20,432. The building thus designed is by Mr. J. Hatchard Smith, F.R.I.B.A., 11, Moorgate Station Buildings, London, E.C., to whom the second premium was awarded.

THE PORCH, LOWER COURT FARM, UPPER LANGFORD, SOMERSET.

This interesting little Renaissance porch is situated on the north side of the house, which belongs to General Sir Lintorn Simmons, G.C.B. The date 1611 occurs on two small shields in the spandrels on the side elevation shown. The porch is constructed of freestone, but has been repaired in places with cement in such a way that some of the mouldings on the bases of columns and the pedestals are almost indecipherable. The cornice at the eaves is covered with thick cast lead, and the pantiles are set in mortar at the verge, and are flashed with the same material where they abut the wall of the house. A freestone chimneypiece, bearing the date 1601, from the same house, appeared in the Building News on Sept. 24, 1897. T. Bradford Ball.

CHIPS.

A stained-glass window is about to be placed in the west front of the church of St. Ignatius the Martyr, Sunderland, in memory of the late Dr. Lightfoot, Bishop of Durham. The late bishop founded the church, at a cost of £10,000, in 1887, in commemoration of his 10 years' ministry in the diocese of Durham. The window depicts nine scenes in the life of Bishop Lightfoot.

The New York Public Library, the competition for which excited some interest in the profession, will not be built at present, Mayor Van Wyck having decided that the financial condition of the city does not warrant the expenditure of the money that the building will cost. The successful architects, Messrs. Carrère and Hastings, have been wise enough to stipulate that their fees shall be paid them by the city, even if the municipal authorities "should fail or neglect in due time to award contracts or to provide for the construction and completion of the said building."

The new Sunday-school which has been erected in connection with Mount Pleasant Wesleyan Chapel, Lockwood, Huddersfield, was opened last week. The leading feature is a large assembly-room, which can, if need require, be used for public worship. A gallery occupies two sides and one end of the room, and a recess for an organ the other end, while at the same end in the well of the room there is a platform. Classrooms open out from the main room. There is also a ladies' parlour, and in the basement a tea-room and kitchen. The building has been erected from plans prepared by Mr. B. Stocks, of Huddersfield, and the cost is about £1,000.

A well-known church in the centre of Liverpool—St. John's, Old Haymarket—is about to be demolished to permit of improvements being carried out in that quarter of the city. In the course of farewell services which were held on Sunday week, it was stated that the demolition of St. John's and of the sister church of St. George would be followed by the erection of four or five new churches in localities in which they may be required.

Port Glasgow School Board have decided to erect an additional story to Jean-street school. This will give accommodation for 160 more scholars, and is estimated to cost about £6,000.

At Wimbledon the foundation-stone has been laid of a new building which is to adjoin St. Mark's Church, and serve the double purpose of a church-house and a parish-room and Sunday-school. The building will include a large hall 71ft. by 40ft., having at the east end a raised platform, and at the west end a gallery. Accommodation will be provided for about 500 persons in the body of the hall, and some 150 in the gallery. Three committee-rooms and a kitchen are also included in the plans. The total cost of the work, including furniture, will amount to about £2,250. Mr. J. Bignell, of Wimbledon, is the architect.

Building Intelligence.

Hampstead.—On Saturday afternoon an official inspection was made by the Hampstead Vestry of the new administrative block of the public baths in the Finchley-road. The old front of the baths was pulled down in consequence of the carrying out of the Great Central Railway works, and the company paid the vestry £8,300 and gave them a larger area of ground to rebuild upon by way of compensation. The new block is built in the English Renaissance style of an Early type, and has cost nearly £9,000. The building is faced with red brick with dressings of Portland stone, and the plinth is of grey granite from Aberdeen. Messrs. Spalding and Cross were the architects, and Mr. Kingerlee, of Oxford, was the builder. The accommodation of the baths has been largely added to, and now includes four large swimming-baths and a large number of slipper-baths.

King's Cliffe.—The church of All Saints', King's Cliffe, which has undergone restoration, was opened by the Bishop of Peterborough, on Thursday in last week. The four 12th-century windows of the ringing chamber are the only remains of Norman work in the church, and have been inserted in the rebuilding of the tower and spire. These windows, with the Early English of the belfry and the arches of the ground story of the tower, denote a rebuilding of the tower and spire in the 14th century. The nave, aisles, transepts, and porches are of the Perpendicular period. One respond remains on the north side of the chancel as part of its Early English construction, while the tower rests on 14th-century arches. The north porch has been rebuilt on exactly the same lines as before, with the floor-line restored to its ancient level. The stonework of the tower and spire has been repaired and pointed, and the crosses to the spire lights restored, and lightning-conductor supplied. A repair and pointing of all the exterior stonework of walls and parapets has been effected, and the lead roofs repaired with down-pipes and dry area. The windows of the nave and aisles have been repaired and restored with their original iron-work, and the best of the old glass reused and made up with new to match. Beautiful fragments of ancient stained glass have been found stowed away in the church, and scattered here and there in the village, and have been fitted together as well as the broken and missing parts will admit, and put into the tracery heads of the windows. The font has been moved, and set on a new stone step. The work has been carried out by Messrs. Roberts Bros., builders, Stamford, under the direction of Mr. J. C. Traylen, A.R.I.B.A., diocesan surveyor, Stamford. A new clock has been made by Messrs. Rowley Bros., Gray's Inn-road, London.

Maidenhead.—The Bishop of Oxford consecrated on the 14th inst. the first portion of St. Peter's Church, Furze Hall. It is built in the Early English style, of red brick, relieved with stone dressings and bands and diaper work in grey brick. The roofs are covered with Broseley tiles. When complete, the building will consist of a nave 57ft. long by 19ft. wide, with north and south aisles; chancel 29ft. in length and the same width as the nave. seating accommodation being provided for about 300 people, in addition to the choir and clergy. The line of the roof over the nave and chancel is continuous, there being no chancel arch, but in its place a lofty and handsome oak screen is to be erected. There is no window in the east wall immediately over the altar, but tall traceried windows in each of the side walls of the apse sufficiently light the sanctuary. The architect is Mr. E. J. Shrewsbury, A.R.I.B.A., Queen Street Chambers, Maidenhead, the builders being Messrs. Silver and Sons, Limited, of Maidenhead.

Manaton.—St. Michael's church was re-opened after restoration on Wednesday week. The east wall has been thoroughly strengthened by the addition of two buttresses, the east window raised to allow space for a reredos, and new inner sills and lintels placed to all the windows, the plaster removed from the walls, and the joints pointed. All the floors were relaid—the chancel and sacrarium with glazed encaustic tiles, the aisles with terracotta tiles and wood blocks under the seats. All the woodwork is of oak, and, wherever possible, the old oak work has been utilised and incorporated with the new; one part bearing the date 1608 now forms the front of the super-altar. An oak traceried rood screen now divides the chancel from the nave, at the north end of which is a carved pulpit on a stone base, while at the south is a space for the organ. The pulpit, which was designed by Messrs. Protheroe and Philpotts, Cheltenham, was a special gift, as was the oak eagle lectern and the organ. The architects were Messrs. Douglas and Minshall, Chester.

Perth.—A special meeting of those interested in St. Ninian's Cathedral was held in the Station Hotel, Perth, on Friday, to consider as to improving and enlarging the cathedral. The Bishop of St. Andrew's, who presided, explained what was proposed to be carried out, and said the alteration would give an unbroken view of the interior of the building. A sum of £10,000 would be required, and they had in hand £2,401 10s., not counting nearly £1,000 for the Wordsworth memorial. A resolution was adopted by the meeting recognising the importance of proceeding at once with the improvement of the cathedral, and a committee was appointed to raise the necessary funds.

Southport.—On Saturday, the Bishop of Liverpool consecrated the new Church of Emmanuel, Cambridge-road, Southport, which has been erected as a chapel-of-ease to the Parish Church of North Meols. The site has been given by the lady of the manor, Mrs. Hesketh, who has also defrayed the cost of the sanctuary. The plan consists of a nave and aisles of five bays with double transept, chancel, and sanctuary. Among the special gifts are the vestry, narthex, screens, boundary wall, gates, &c., brass lectern, marble pulpit, and marble font. Apart from all these special gifts, the cost of the building has been about £18,000, and when the whole scheme is completed by the erection of a tower 108ft. in height and vestries, the total cost will be about £23,000. The church, which is Early Perpendicular in style, will provide sitting accommodation for 1,200 persons. Messrs. Preston and Vaughan, of Manchester, are the architects.

Thetford.—On Friday a special meeting of the town council was held to consider a report upon the present condition of that portion of the town-hall comprising the county-court room and the old council chamber. The report, prepared by Mr. H. J. Green, architect, of Norwich, stated that the whole of the north gable end proved upon examination to be built upon little or no foundation, and to be, in consequence, much fractured, and out of the perpendicular. It was practically useless to underpin or in any way repair the structure, the only satisfactory method being to take down the end in question, and rebuild it on solid foundations. In connection with this work, other small repairs to portions of the building would be necessary, but in any case the architect strongly discountenanced the adoption of any temporary methods in dealing with the north gable end. The mayor expressed the hope that whatever work might be undertaken, the original form of the building would be adhered to. It was decided that the county-court fittings should be transferred to the large court-room, and it was unanimously resolved that Mr. Green be requested to prepare plans and specifications at once, and that until the work has been carried out the hall be not let to the public for any purpose whatever.

Wellington, Salop. — All Saints'' parish church, Wellington, will shortly be closed for extensive alterations and repairs. It is proposed to remodel the interior altogether. The existing unsightly iron columns will be cased with marble, making them more massive and attractive. The new columns and entablature will be of the Doric Order on the ground floor, and of the Corinthian Order above. The pitch of the galleries will be increased, so as to afford the worshippers greater facility for seeing below. A new feature will be a lofty oak screen, separating the chancel from the nave, and forming a morning chapel and chamber for the organ. The chapel will contain movable seats, so as to permit of its being used for ordinary services. The organ, remodelled, will be brought down to the ground floor, and new stalls provided for the choir. A portion of the galleries at the east end will be removed, but the seating accommodation will not be curtailed, as compensation will be found in the rearrangement of the seats. The heating and ventilation of the church will be rearranged and perfected. Mr. Dalgleish, of Wellington, is the architect.

COMPETITIONS.

Ludlow.—At the last meeting of the town council the Public Lighting Committee reported that in answer to an advertisement for the best and most economical schemes of electric lighting for the borough they received ten schemes from engineers. They had considered these schemes, and were of opinion that Mr. J. S. Enright, of 202, Holland-road, Kensington, was entitled to the premium of £20. The report was adopted.

Port Elizabeth, S.A.—For the public library and Savage Memorial Hall to be erected at Port Elizabeth thirty-seven designs were sent, which were marked by the librarian as received from 1 upwards. One design was rejected in consequence of being distinguished by a motto. The assesors, Messrs. J. W. Hammersley-Heenan and Richard Wright, with the assistance of Mr. W. T. Hollands, F.R.I.B.A., accorded the first premium of 100 guineas to design No. 1, which proved to be by Mr. Henry A. Cheers, of Twickenham, London, and the second premium to No. 36, by Messrs. Charles E. Bateman and Herbert Bartland, of 81, Edmund-street, Birmingham. Mr. Cheers' design shows a building finely treated in the Elizabethan style, the estimated cost of erection being £22,000.

CHIPS.

An infants' department is about to be added to the church schools at Guarrington, near Sleaford, from plans by Mr. Kirk.

The recumbent statue for the tomb of the Duke of Clarence and Avondale is about to be placed upon the lid of the sarcophagus in the Albert Chapel at Windsor Castle.

Lieut.-Colonel A. C. Smith, R.E., L.G.B. inspector, has held an inquiry at Colchester into the corporation's application for sanction to a loan of £36,000 for the erection of the town-hall.

The first section of the new church of St. Michael and All Angels, at Little Ilford, has been consecrated. The church, which replaces an iron structure, is of red brick with stone dressings, and consists of a nave and its aisles. The floor is of woodblocks, and the window of cathedral glass in lead sashes.

An inquiry was held at Rhayader, on Saturday, by Colonel W. E. Slacke, Local Government Board Inspector, with references to an application made by the Radnorshire County Council to the Local Government Board to issue a provisional order authorising the said council to borrow the sum of not exceeding £32,000 for the purpose of building an asylum jointly with Breconshire at Talgarth. There was no opposition. The cost of the new asylum is estimated at £141,000, of which Breconshire has to provide £99,016 and Radnorshire £41,933.

The first arbitration case for the acquisition of properties scheduled under the Glasgow Improvement Act of last session has been held on Monday, Tuesday, and Wednesday in this week, in the Windsor Hotel, Glasgow. The claimant is Mr. Patrick Neeson, and the property to be taken is situated in King-street, City, part of it being occupied by Mr. Neeson himself as a public-house. The amount claimed for the property and the good-will of the business is £9,000. The arbiters are Mr. R. P. Lamond, for the claimant, and Mr. W. R. Copland, C.E., for the Improvement Commissioners, with Sheriff Jameson, Edinburgh, as oversman.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied some of their patent Manchester grates to the Richmond Lunatic Asylum annexe, Dublin.

On Thursday afternoon in last week the foundation-stone of a new Wesleyan chapel for the village of Barugh, near Malton, was laid by Mr. E. W. Beckett, M.P. Mr. E Taylor, of York, is the architect, and the contract is in the hands of Mr. C. Mansfield, of York.

The new butchering department and stables for the Hetton Downs Amicable and Industrial Society, Limited, was formally opened on Saturday. The buildings are of Sherburn brick, roofed with blue slates, and the roofs are surmounted with ornamental ventilating turrets. The front has a total length of about 90ft. facing into Regent-street, while the back elevation is in Princess-street. The contractor is Mr. Robert Wade, of High Moorsley, and the clerk of works Mr. George Oates, of Leamside. The architects are Messrs. Barnes and Coates, A.A.R.I.B.A., of Sunderland and West Hartlepool.

The Streets and Buildings Committee of the Scarborough Corporation have accepted the offer of a piece of a ground, a little over six acres in area, having a frontage on Manor-road, for the sum of £8,500. It will be laid out as a recreation ground.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers so complete volume just ended should order at once, at many of them soon run out of print.

Received.—C. W. O.—T. P.—B. W. L.—T. L. and Pow.—S. F. Co.—E. P. R.

"BUILDING NEWS" DESIGNING CLUB.

Ralph Knott.—(We note your approval of our awards. The conditions set forth the accommodation to be provided, and rooms for female nurses were not included. In a men's home of the kind contemplated, such bedrooms are not needed in the ordinary way, and it is better for a nurse to sleep off the premises if she has been on day duty.) Gothic Jones.—(We do not limit you to any style for the furniture, but Mediæval forms are not so well adapted to present-day uses. Simplicity by all means; but furniture to be good, in the best sense of the word, should be strong and suitable, artistic, and not needlessly costly.)

Correspondence.

ORNAMENTAL BRICKWORK: ARCHES.

To the Editor of the Building News.

Sir,—The writer on "Ornamental Brickwork: Arches" (p. 515 of your last issue) gives some very good information so far as it goes; but in treating of the straight camber arch (not, of course, to be confused by your readers with the segmental arch), he slips rather too easily over the subject, merely stating that it "ought to be set out on scientific rules from a face mould, and proper levels obtained for cutting the bricks." That is only partly true, as the rules are not scientific, but to a great extent rule-of-thumb. He does not explain the rule for setting out this apparently most simple of all the arches, but really almost the most difficult. The rules are given in two handbooks published in Weale's Series, but in terms which do not agree, and which assume a possession already by the learner of half the necessary knowledge—perhaps a necessary result of the writers possessing great technical skill in bricklaying without having much literary art. The writer of your article would be doing good service if he undertakes to supply the omission by explaining clearly how one, not a bricklayer, can set out this arch and prepare the face mould with the levels and lengths marked thereon, so that a bricklayer could cut out the bricks and set them therefrom. Most people other than bricklayers imagine that in this, the straight camber arch, the lines of the joints (including those of the skewbacks) radiate from a centre; but they do not.

In the approximate elliptic arch formed of arcs of circles, the voissoirs do, of course, radiate from a centre, or centres. I introduce this latter remark, however, only for the purpose of explaining that on a visit to one of the best of our Metropolitan polytechnic classes for practical instruction in drawing, cutting, and setting brick arches, I found in the larger upper arc all the joints radiated to their centre, except those of the keystone, which were worked to a centre much higher, giving, of course, a much shorter radius; but nobody thought it a defect or of any consequence; it was so set because it came so from the mason, and it was nobody's business to flux the product of the two discordant trades. It was rather considered a creditable thing that the mason's ill-shaped work could be incorporated by the bricklayer, without troubling the mason to correct it.—I am, &c., Architect.

CHIPS.

Friday, July 1, has been fixed as the date for the consecration of the new church of St. Peter, now fast approaching completion in the Wightman-road, Hornsey. The Bishop of London will perform the ceremony. The church, which was illustrated by perspective and plan in our issue of May 14, 1897, is being built from designs by Messrs. James Brooks and Son, of Wellington-street, Strand, W.C.

A fountain erected in Market Drayton in commemoration of the 60th anniversary of Her Majesty's reign was formally opened on Monday week. The fountain was designed by Mr. G. A. Craig, surveyor of Market Drayton, and built by Messrs. Harding, of Nantwich. It is constructed of red and grey stone, with marble panels round the base.

Mr. A. E. Prescott (28 years of age), deputy surveyor, Luton, has been appointed surveyor to Douglas Town Council, at a salary of £200 a year.

A proposal is about to be submitted to the shareholders of the Hastings Pier Company for the formation of a winter garden at the north or landward end of the present structure. The plans show a building including a hall capable of holding 4,000 people, provision for a band, and other attractions. The estimated cost is between £30,000 and £40,000.

The Streets and Buildings Committee of the Edinburgh Town Council have agreed to recommend the council to authorise the widening of Stockbridge bridge at a probable cost of £2,400.

The Soldiers' Institute in St. Botolph's-street, Colchester, opened by the late Duke of Albany, has been altered and redecorated to serve as a Liberal clubhouse, and was reopened last (Thursday) night by Sir Edward Grey, M.P. The decorations have been carried out by Mr. Bennell, of Green-street, Colchester.

On Saturday, St. Gregory's Church, at Crackwell, North Riding, was rededicated, after undergoing renovation, at a cost of about £500.

Mr. Frederick Thorpe, deputy gas and water engineer to the Widnes Corporation, has been selected out of 62 candidates to fill the post of engineer and manager of the gasworks at Colne, Lancs, at a salary commencing at £225 per annum. The short list comprised the deputy gas engineers of Bradford, Blackburn, Halifax, Lancaster, Stockport, and Widnes.

Mr. Peter Dollar, A.R.I.B.A., F.S.I., was married on Thursday in last week at Christ Church, Lancaster-gate, to Miss Emily Ada Prince, the second daughter of the late Mr. Joseph Webster Prince, of Brickwood House, Croydon.

An inquiry was held at Barking yesterday (Thursday) by Mr. W. E. O. Meade-King, an inspector of the Local Government Board, with reference to the application of the Urban District Council of Barking for sanction to borrow £3,250 for the provision of public baths in East-street, Barking, and £15,000 for purposes of electric lighting.

Mr. H. H. Law, an inspector of the Local Government Board, recently held an inquiry respecting an application of the Croydon Town Council for sanction to borrow £10,355 for works of kerbing, channelling, &c.; £1,475 for the further improvement of George-street, £7,000 for the Norbury drainage scheme, £550 for the construction of an outfall sewer at South Norwood, and £500 for the construction of an additional settling tank on South Norwood sewage farm.

Intercommunication.

QUESTIONS.

[11931.]—**White Efflorescence on Tiles.**—Can anyone inform me how to permanently stop white efflorescence (appearing again and again as fast as it is removed) on red tiles, which have now been laid twelve months? These are on a slate balcony some 9ft. off the ground, the slate being floated over with cement and sand to receive them.—Puzzled.

[11935.]—**Architect's Charges.**—I shall be greatly obliged for any information on the following:—A client employs an architect to make plans for three dwelling-houses, say twelve rooms each, to be erected on an irregular piece of ground, which the architect has to survey. The plans are approved, and the architect is instructed to prepare specifications for same, which he delivers to the employer with the drawings. The employer, unknown to the architect, puts out the drawings to tender to one builder, who happens to be a relation of the employer himself. The employer comes to the architect some time afterwards and informs him that the tender is too high, and, therefore, he will not build to the plans, but will pay for them, and will have others of a smaller size prepared. When the architect sends in his account the employer refuses to pay it, and offers one-sixth the amount, which was refused, the charge being based on the amount of the tender at 2½ per cent. Is this charge too high? And, if so, what is the right charge to make for the plans and specifications, no charge having been made for preliminary survey of ground? The employer's argument is, that as he is not making use of the plans, &c., by building from them, he is not bound to pay any per cent. on lowest tender; but only a small sum for time, insisting that the whole of the work could be done in one week.—Justice.

[11936.]—**Steep Pitched Hammer-Beam Roof.**—I shall be obliged if any of your readers can tell me of any instance of a steep pitched hammer-beam roof, 40ft. span; and, if not, what is the widest span extant, and has it been necessary to put in tie-rods?—Inquirer.

REPLIES.

[11933.]—**Adjoining Owner.**—"Royston" having two adjoining building sites, erects on one a house, and lets it, with the whole of the site, to a tenant, without reservation. He now inquires whether he can enter on the land, the use of which he has sold to his tenant (he has sold its temporary use for the consideration of the rent) for the purpose of pitching a scaffold to enable him to build up to the verge of the remaining plot. Of course he cannot legally do so, nor may he hang a scaffold over his tenant's land, nor drop bricks or mortar on it, or in other way commit a trespass in derogation of his grant of tenancy. What would he himself think, if he had hired the use of a piano, the owner insisted on playing it, or covering it up, or in any other way interfering with his ("Royston's") enjoyment and use of it? "Royston" should have made his proposed building operations the subject of a condition in the agreement of tenancy. I have just heard of these two illustrative cases:—(1) The owner of a row of six small houses with front gardens, sent men who erected a scaffold in the gardens and raked out and repointed the mortar joints of the brickwork fronts. He asked no leave of the tenants. One tenant, who had given notice to quit next quarter-day, objected to the dust and nuisance arising from the work, and brought action against his landlord, who, acting under competent legal advice, settled the matter by a cash payment. 2. Landlord was lessee under covenant with his superior landlord to repair. Superior landlord served him with notice to repair, *inter alia*, the roof. The lessee landlord employed a builder to do so, who erected ladders and get on the roof without the leave of lessee landlord's tenant. Tenant brought action against lessee landlord for trespass, and recovered nominal damages and costs. I am told that costs are always given in such cases, although the damages may be but nominal—as the law favours the maintenance of such rights by action rather than by resort to the forcible removal of the trespasser and his property, which is the other alternative. If a landlord, in letting his premises, desire to reserve any rights to himself to enter during the term for the purpose of repairing the premises, or to do any work to his adjoining properties, he must expressly reserve such right in a written contract of tenancy, as no such right will accrue to him by implication. In the absence of such reservation, the permission of the tenant is necessary.—A. H.

[11933.]—**Adjoining Owner.**—Unless there is any written agreement to the contrary effect I do not think the tenant can refuse to allow the scaffolding to be erected for the building which abuts, for if such a rule was common, the owner of land would be unable to build on a plot adjoining others they had let. I think owner is within his rights in this case.—Architect.

The Hoxton Free Library was opened by Sir John Lubbock, M.P., on Wednesday afternoon. The building is in Pitfield-street, and supersedes a temporary one. The cost of the site was £4,500, and that of the building £10,250. Added to these figures must be the cost of the fixtures, furniture, and books. The total cost will exceed £20,000. The architect is Mr. H. T. Hare.

The Bill for establishing a college of forestry at Cornell University, and for placing in its hands for management a tract of thirty thousand acres in the Adirondack Mountains, has been passed by the New York Legislature, and signed by the Governor, and its provisions are to be immediately carried out. The faculty of the college is to consist of a professor, two instructors, a forest manager, and such rangers and superintendents as may be required; and it is provided that the proceeds of timber cut and sold from the college forests shall be paid to the State.

LEGAL INTELLIGENCE.

Action by the Bath City Architect.—At Bath County-court, on the 11th inst., before his Honour Judge Dundas Gardiner, an action was brought by Major C. E. Davis, F.S.A., the city architect, against the corporation of the city of Bath to recover certain payments for work done by him on behalf of the corporation, and the corporation relied on two agreements made between themselves and a Mrs. Joyce, contending that she was liable to indemnify them against the claim. Mrs. Joyce, the third party to the action, admitted liability to some extent. Mr. Vachell, in opening, said the corporation admitted Major Davis's claim, and therefore the fight was really between the corporation and the third party; £15 was the amount of the claim, and it was for professional charges in connection with the rebuilding of the restaurant which stood at the south-western corner of Cheap-street. Long negotiations took place, during which two agreements were executed, in which Mrs. Joyce agreed to pay Mr. Davis's "reasonable charges." It was upon this that the question hung. Evidence was given on both sides, that for the defence coming from experts like Mr. William V. Gough, vice-president of the Bristol Society of Architects, and Mr. W. L. Bernard, president of the Bristol Society, who spoke as to what they considered fair charges. Defendant had paid £15 15s. into court. His Honour, in giving judgment for her beyond the money in court, with costs, said under the first of the agreements Major Davis claimed £27 10s. for perusing two sets of plans. It seemed to him Major Davis was in a very unfortunate position, because one could see that it was to his interest to reject these plans. He was in that awkward position in which a man's interest is opposed to his duty, and he thought it was unfortunate that any gentleman connected with the corporation should be placed in that position. He allowed ten guineas for perusing plans, for which £27 was charged; five guineas for the elevation and detailed drawings, and nothing for passing works on completion.

Manchester Corporation v. Perkins, Graham, and Co., Limited.—On Saturday, at the Westminster Palace Hotel, Sir Benjamin Baker had again before him the sensational arbitration case, in which the Manchester Corporation lay charges of fraud against Mr. Perkins, managing director of Messrs. Perkins, Graham, and Co., Limited, contractors, of Manchester and London. The defendant company were the contractors for certain sewers, about 1,800 yards in length, in Deansgate, Manchester, and were to build two rings of brickwork, the inner one of blue brick and the outer of red brick. When the work was completed the corporation officials had it opened up for the purpose of tracing certain extras charged for by the contractors, and then discovered that the outer ring had been left out over almost the entire work. In some places a loose collar of brick had been laid over the inner ring in such a manner that anyone seeing the work in section would suppose it to have been carried out in accordance with the terms of the contract. The defects in the sewers necessitated complete reconstruction, and the Corporation now claimed £12,000 damages against the defendant company. In the course of the evidence it transpired that no record had been kept of the number of bricks supplied, and according to the plaintiff's witnesses the total number was over 235,000 short. The contractors, however, combated this statement, and alleged that the deficiency was certainly not more than 40,000. The defective work was admitted by both parties, and the only question at issue was the sum of money to be paid by the contractors. The defendants estimated that £1,900 should easily reimburse the city council for all work necessarily undertaken, which sum they had paid into court. Evidence was tendered by the plaintiffs to the effect that £5,636 had actually been spent on the work of reconstruction. The contractors did not deny that this might be so; but brought expert witnesses to prove that the corporation had been guilty of gross extravagance, and that the work could have been carried out for £500 according to one witness, for £950 according to another, or for £1,850 according to an estimate made by Mr. Baldwin Latham. Mr. James Perkins, managing director of the defendant company, was called, and declared that he never had a suspicion that the work was being scamped. He made no calculation during the time the work was proceeding as to the number of bricks required. Mr. John Tomlinson, the acting manager, gave similar evidence. At the conclusion of the evidence Mr. Bradbury, who appeared for Mr. Perkins, contended that the plaintiffs had failed to establish the charges of fraud levelled against his client. They had called bricklayers to prove that Mr. Perkins had urged them to scamp the work, but when put into the box they made no such charge. As a matter of fact, the men, who were employed on piecework, had improperly fulfilled their obligations, and had swindled both the corporation and the contractors. At the conclusion of counsels' speeches, the inquiry terminated, Sir Benjamin Baker reserving his decision.

Alleged Frauds by Sanitary Tube Makers and Corporation Officials.—At the Manchester City Police-court, on Monday, John Tetlow, a director of Messrs. John Tetlow and Co., sanitary tube manufacturers, Littleborough, and David Hollard, a senior clerk in the Paving Department of the Manchester Corporation, were charged with embezzlement and conspiracy to defraud. The evidence went to show that the firm of which the prisoner Tetlow is a member, had for a number years supplied sanitary tubes and other materials to the corporation, and that by an ingenious system arranged between the two prisoners Tetlow intercepted the monthly accounts sent by the firm to the corporation and substituted others for larger amounts. These substituted accounts, it was alleged, were passed by Hollard, and cheques in respect of them were sent to Messrs. Tetlow. The prisoner Tetlow again is said to have intercepted these remittances, and, paying them into a private account, drew upon that account for the amount due to the firm, which he then paid into Messrs. Tetlow's bank. When arrested, Hollard is said to have admitted that these proceedings had been going on for a number of years, and the money fraudulently obtained had been equally divided. He added that he had received about £30 a month as his share. The prosecution allege that the defalcations amount to about £5,000. The prisoners were committed for trial to the City Sessions, bail to a heavy amount being allowed.

Blundering of an Urban Authority.—At the Flint County-court, on Friday, before his Honour Judge Sir Horatio Lloyd, G. H. Hollingworth, surveyor and mining engineer, of Manchester, and official liquidator of the Bailey Hill Colliery Company, Mold, sued the Rev. W. T. Thomas (Gweufrwd), Aafod Alan, Mold, for the sum of £20 for trespass. From the evidence of the plaintiff it appeared that the trespass complained of was caused by the defendant connecting a drain from his property to the main sewer of the Mold Urban District Council, recently constructed at a cost of about £7,000, and which runs through some land belonging to the Bailey Hill Colliery. The plaintiff, in cross-examination, admitted having received the sum of £25 from the Mold Urban Authority for the right of constructing the main sewer through the land; but that did not give the urban authority a right to make any connections with the drain through their land. Mr Churton, for the defence, said that what the defendant had done had been brought about entirely through the blundering of the Mold Urban District Council, who had served him with notice to connect the drain at this particular spot, and had even gone so far as to threaten legal proceedings against him if it was not done. Under these circumstances the defendant naturally enough took it for granted that the urban authority, in acquiring the right to run the main sewer through this land, had also acquired a right to make connections with the sewer. He, however, found out that this was not so, and immediately he discovered this he communicated with the plaintiff with a view to coming to an amicable arrangement. The plaintiff declined to accept anything less than £20, so the defendant disconnected the drain, and had paid the sum of £1 into court, which, he contended, was ample to cover the trespass committed. His Honour held that the £1 paid into court was quite sufficient to cover the damages; but, as the defendant had not informed the plaintiff that he had disconnected the drain, he could not allow him his costs, so each party would have to bear their own costs. The same plaintiff brought a similar action against the Kelsterton Brewery Company, the damages claimed being £10 in this case. The same judgment was given as in the foregoing case.

The Price of Bricks.—At Lewes County-court on April 12th, before his Honour Judge Martineau, Messrs. Rummery and Sons, brickmakers, of Heathfield, sought to recover from J. W. Hobbs, builder, of Eastbourne, the sum of £23 10s., balance of account for bricks sold and delivered. The whole question was as to the price agreed upon for certain bricks duly delivered. George Rummery said in October of last year he called at a house being built by Mr. Hobbs, and a man named Ticehurst asked him the price of bricks. Witness told him the price was 29s. a thousand in the yard and 39s. a thousand delivered. The house where they were to be delivered was four or five miles from the yard. A day or two afterwards Ticehurst told witness he was to bring the bricks, and accordingly he delivered 13,000, for which he had been paid at the rate of 39s. per thousand. Subsequently he delivered 17,000 bricks, and it was in respect of them that the claim was now made. In cross-examination plaintiff said he never saw Mr. Hobbs himself as to the price of the bricks. Witness did not say his horses were standing idle and he could easily do the carting. He did not know and did not think it likely that kiln bricks, which were worth about 5s. a thousand more than his clamp bricks, could be delivered from Tunbridge Wells for less than he charged. Alfred Edmund Rummery, a nephew of the plaintiff, proved that the first 13,000 bricks were duly paid for by cheque at the rate of 39s. a thousand. That was a fair and reasonable price. Frederick Richard Parris, builder, of Heathfield, said the price of bricks last year was from 25s. to 29s. a thousand in the yard, and went up to 39s. a thousand outside. Cross-examined: The brick produced, delivered by another Heathfield maker at 38s. a thousand, was superior, he should think, to plaintiff's at 39s. Harry Burcham Overham, proprietor of a brickyard at Horeham-road, did not think that 29s. in the yard was an excessive price for the time of year. For defendant: Wm. Herbert, foreman, employed by Mr. Hobbs, said plaintiff showed him some bricks, and said the price was 29s. a thousand, delivered. Next day plaintiff came again, and in witness's presence said the price was 29s. a thousand, delivered. Mr. Hobbs told him about 30,000 would be wanted. Ticehurst never had authority to order bricks. Cross-examined, witness said Rummery was wrong when he said he never saw Mr. Hobbs as to the price of the bricks. James William Hobbs said in October he was building a house at Heathfield, and he asked the last witness to ascertain the price of bricks. Next day Mr. Rummery came and said he would deliver the bricks at 29s. Some time afterwards plaintiff asked him for a cheque on account, and witness sent him one for £10 10s. Again he sent a cheque for £15 7s., simply as payment on account of bricks. In January, when witness received received Rummery's account to date, he wrote back that some mistake had been made, as the price was 29s., not 39s. To this Rummery replied that they had made no mistake, and they had paid 10s. a thousand for the cartage. Witness was manager for Messrs. Pearce and Co.; but this house was a private one, which he had permission from his employers to build. Charles Elward Hobbs, brother of the last witness, said he was responsible for the cheque for £15 7s. being sent on to the plaintiff. His Honour said his experience was that builders did not usually pay more than was due. He believed the whole case had arisen out of a certain amount of carelessness when the price was agreed upon. He gave judgment for the plaintiff.

Temporary Structures in Forecourts.—At the Brighton police-court, on Friday, Moses Lee was summoned by the corporation (1) for erecting, on Nov. 12, 1897, a new building on the forecourt in front of No. 33, Kensington-gardens, beyond the line of frontage prescribed by the town council on Oct. 31, 1895, and (2) for erecting a new building on the forecourt of No. 33, Kensington-gardens, without delivering to the borough surveyor a block plan and detailed plans and sections of the said building. Mr. Talbot prosecuted on behalf of the corporation. Defendant put in a formal plea of not guilty. Alfred Weller, deputy borough surveyor, said he had seen a structure in the forecourt of Kensington-gardens. It was of a temporary character, about 11ft. long, 11ft. 6in. wide, and 8ft. in depth. There were six uprights and three rafters, the structure being to support tarpaulin or canvas. Inside the structure there was a stall for displaying goods. No plan had been submitted to the borough surveyor in respect of this building, nor had notice been given of intention to erect the building. Mr. Talbot said he would withdraw the summons if defendant would pull the structure down and pay the costs. Defendant agreed to do this, and the case was therefore adjourned.

Lands Clauses Consolidation Act, Section 92.—In the Court of Appeal, before the Master of the Rolls and Lords Justices Rigby and Collins, an appeal was heard on Tuesday, "Allhusen v. the Ealing and South Harrow Railway Company." The defendant company desired to purchase, for the purpose of making their railway, a small portion of a private road forming the approach to a house known as Twyford Abbey, belonging to the plaintiff and appellant, and the question at issue was whether they could be compelled to take the whole of the property. Mr. Justice Stirling, before whom the case came in the first instance, on March 22nd, decided that they could not; and their Lordships now upheld his decision, and dismissed the appeal, with costs.

Re Bernard Joseph Green.—In this case, that of an architect and surveyor practising at Walpole-street, Wolverhampton, according to Official Receiver's statement, the liabilities are estimated at £235 8s. 6d., and the assets nil. The debtor was formerly in the Royal Engineers. He returned to Wolverhampton in 1892, and after assisting his father, the late Mr. W. A. Green, for a time, he commenced business as an architect and surveyor, without capital. It had never been successful, and in 1895 a distress was levied under which all his furniture was sold. He attributes his insolvency to want of capital, competition, and bad trade.

An alabaster reredos and brass altar rails have been placed in the chancel at the Seamen's Orphanage Chapel, Newsham Park, Liverpool, as a memorial. They were designed and executed by Messrs. Norbury, Paterson, and Co., of Myrtle-street, Liverpool.

PARLIAMENTARY NOTES.

The London Building Act (1894) Amendment Bill.—In connection with the consideration of this Bill in Committee, the adjourned debate on the question, "That it be an instruction to the committee to take into consideration whether the offices and buildings of the Stock Exchange shall be exempted from the operations of Parts VI. and VII. of the principal Act," was resumed on Monday night. Mr. Pickersgill said that the statement that the London County Council did not object to this instruction was misleading. Neither the County Council nor its Parliamentary committee had had the instruction under consideration. The members of the Stock Exchange desired to have their offices and buildings exempted from Parts VI. and VII. of the principal Act. The main object of Part VI. was to lay down in regard to the construction of buildings certain conditions which were for the general advantage; and to exempt the Stock Exchange would be most unfair. If the Stock Exchange had a *locus* before the committee, they could submit their case; and, if they had not, why should the House of Commons specially interfere on their behalf? One section (75) of the principal Act might press hardly on the Stock Exchange. That body wished to make certain extensions of their premises; and section 75 prohibited buildings from exceeding certain dimensions without having party-walls. The power of exemption which was given to the London County Council was limited in a manner that would exclude the Stock Exchange; and therefore, as a compromise, he should move to leave out from the instruction the words "Parts VI. and VII.," and substitute the words "Section 75." Mr. Brigg seconded the amendment. Mr. Cohen said that, while it was true that the County Council had not assented to the instruction, approval had been notified by the special members of the Parliamentary committee to whom the question had been referred by the whole committee. The Stock Exchange did not claim to be exempted from the general law by this instruction; they only asked that the committee on the Bill might consider whether they were entitled to this exemption. The House divided, and the numbers were: For the instruction, 64; against, 46; majority, 18. The instruction was therefore carried.

Mr. Passmore Edwards is about to erect a public free library for Acton, on a fine site in the High-road, and Mr. Maurice B. Adams, F.R.I.B.A., has been appointed the architect.

Mr. W. W. E. Fletcher, M.B., Local Government Board inspector, was present at the Municipal Buildings, Dale-street, Liverpool, on Tuesday, to inquire into the circumstances attendant upon the application of the Liverpool City Council for sanction to borrow £38,000 for the purchase of a site at Fazakerley for an infectious diseases hospital.

Additions are being made to Northey-street Board School, Limehouse, and special consideration has been given to the ventilation, which will be effected on the Boyle system.

The municipal buildings committee of Glasgow Corporation had under consideration on Tuesday the decoration of the Banqueting Hall. It was decided that the three centre panels should be painted by Mr. James Lavery, R.S.A., Mr. Alexander Roche, A.R.S.A., and Mr. E. A. Walton, A.R.S.A.; and the lunette above the platform by Mr. George Henry, A.R.S.A. The pictures will be illustrative of incidents in the history of the city. Each artist will receive a fee of 500 guineas.

A fire broke out early on Monday morning in the saw-mills at Troon Harbour, whereby the whole buildings, machinery, and stock, including several thousands of sleepers saturated with creasote, were destroyed. The mills are owned by Messrs. Calder and Son, Glasgow, and the damage is estimated at between £10,000 and £12,000.

The Princess of Wales has consented to open the new Laboratories of the London School of Medicine for Women in Handel-street, Brunswick-square, next July.

Messrs. Doulton, of Lambeth, London, the well-known potters and sanitary engineers, have removed their Manchester depot to Temple Chambers, St. James's-square, Manchester, where they have opened commodious showrooms for the display of their manufactures. This change in address has been caused by the large increase in the local demand for their productions. Prominent in their showrooms is a fine display of glazed faience fireplaces and mantels, showing a variety of beautiful designs and colours. Amongst the sanitary fittings is a fine display of baths of the most modern style of design. Specially noticeable are the vitreous enamelled baths, lavatories of a great variety and form. Urinals and slop-sinks are a leading feature in these showrooms. A variety of the manufactures are shown, which are all of the high-class nature associated with this firm. Architects and others connected with the building trade will find such showrooms as these of great service to them.

WATER SUPPLY AND SANITARY MATTERS.

Sheffield. — Clearing Away an Insanitary Area.—The corporation of Sheffield, although actively engaged in widening leading thoroughfares, providing electric tramways, and in laying-out and beautifying parks and woods and recreation grounds, are also giving attention, says the *Leeds Mercury*, to the improving out of existence of some of the worst slums and alleys in the city. Some years ago, the whole of the property in the very heart of Sheffield, and covering an area of 2,398 square yards, was condemned as insanitary and unfit for people to dwell in. The houses are occupied by the very poorest and most destitute of the inhabitants. The average death-rate of the city during the last ten years has been 21 per 1,000; in the condemned area it has been, in the same period, 31 per 1,000. The Local Government Board were approached by the corporation and sanction obtained to the clearing of the entire area, and the carrying through it of two wide streets. That arrangement divides the area into three sections, and one section has to be cleared and cottages rebuilt before another is touched. The city surveyor estimated that the cost of the buildings and land would be £72,424, and the formation of new streets, &c., £8,498; total, £80,922. He estimated that the surplus land, after laying out the new streets, would be worth £21,250, on which sufficient house accommodation has to be provided for 750 people. The corporation had to come to terms with 62 different owners, and they have done so with the exception of four, at a cost of £86,814. The estimate has, therefore, already been exceeded by £5,892, and there are four more plots to buy. The work of clearing the first section, on which there are about 250 houses, including three public-houses, will be commenced almost immediately. If built according to the requirements of the Local Government Board it will not be possible to let the new houses for less rents than from 5s. 6d. to 6s. 6d. per week. The alternative under consideration by the corporation is to erect flats.

A new theatre is about to be built at Govan, a little to the west of Govan Cross. The theatre will have a frontage of 70ft. to Govan-road, and another of 160ft. to M'Kechnie-street. The main entrance will be situated in Govan-road, and will be surmounted by a round tower 119ft. high; while the gallery exits will lead into M'Kechnie-street. Accommodation will be provided for an audience of 3,130. The estimated cost of the building is £10,000.

A crowded meeting was held at Rugeley, on Thursday night in last week, to consider the proposals for the erection of a new parish church. The vicar stated that the amount of subscriptions promised and given was £2,444. The Hopkins bequest amounted to £3,526, and if this money could be obtained they would have about £6,000 towards the erection of a new church. The feeling of the meeting was taken upon the question whether the new church should be erected upon the site of the ancient parish church, of which only the chancel remains, or in a more central position, and there was a majority of 15 in favour of the latter. A committee was accordingly formed to report upon a suitable site, the one most in favour being that upon which the present mission church stands.

In the case of the application for discharge from bankruptcy by Charley Mallinson, trading with Ebenezer Thorpe as Thorpe and Mallinson, Holmfirth, builder and stone merchant, the discharge has been suspended for one month, ending April 18, 1898. In that of Walter Atkin Skinner, Wadhurst, builder, the discharge has been suspended for two years, ending March 16, 1900.

Two windows have just been filled with stained glass in the north choir aisle of Truro Cathedral. The subject forms links in the historic series, illustrating the progress of the church, designed for the cathedral. In the eastern light are represented three martyrs of the Early church, St. Cyprian, Bishop of Carthage, St. Perpetua, and St. Lawrance, the great Archdeacon of Rome. On the predella is represented the scene of St. Cyprian's martyrdom. The northern window contains figures of St. Pancras, St. Alban, and St. Katharine. All the windows in the north aisle of the cathedral, with the exception of a single light, are now filled with stained glass.

In view of the adjacent works now in progress in connection with the construction of the Central London Railway, and the subways in front of the Mansion House, an examination has been made as to the effect (if any) of these operations on the stability of the Mansion House itself, with the result that no cause of danger or alarm exists. The annual works of reparation and renovation, recently in progress and now completed, would in the ordinary course have taken place at the close of the last mayoralty, but were postponed till the Easter vacation for the convenience of the Lord Mayor. Mr. Andrew Murray, the City surveyor, states emphatically that no ground exists for the alarmist statements recently promulgated.

STAINED GLASS.

Copenhagen.—At St. Alban's English Church, on Sunday, the stained-glass window subscribed for by British residents in Denmark as a memorial of the 60 years' reign of Queen Victoria, was unveiled by the British Minister, Sir Charles Scott. The subject of the window is "The Home in Bethany." The Royal monogram is introduced in the cinquefoil, and the Royal arms, with the dates 1837 and 1897, are inscribed on scrolls at the foot of the window. Another window, filled with stained glass in memory of Professor and Mrs. Stephens, was unveiled at the same time. The subject of this window is "Bearing the Cross." Dr. George Stephens was Professor of the English Language and Literature in the University of Copenhagen during 42 years, and was regarded as the first Runic scholar in Europe. A small balance remaining after paying the expenses of the Jubilee window has been utilised for placing a second coloured window in the church porch. The three windows have been designed and executed by Messrs. Heaton, Butler, and Bayne, of London, under the supervision of Sir Arthur W. Blomfield, A.R.A., the architect of the church.

CHIPS.

The Primitive Methodist new Sunday-schools erected in Kirkland-street, St. Helen's, at a total cost of about £1,500, were opened on Thursday in last week. The premises have been built on the site of the old chapel, and have a frontage of Ruabon bricks, with terracotta enrichments and red stone dressings. The main hall is 52ft. by 31ft. There are twelve classrooms. The whole of the work has been carried out by Mr. Joseph Ellison, builder and decorator, of St. Helen's, from designs prepared by Mr. John Wilson, architect, of Runcorn.

At the last meeting of the Coventry Trades and Labour Council the president announced that photographs were being taken of slum property in various parts of the city, and, as a contrast, others of the houses of the owners, for the purpose of a magic-lantern lecture in the autumn, at which information would be supplied as to rent of the slum dwellings, number of inmates, &c.

A bust of the late Mr. J. F. B. Firth, the first deputy chairman of the County Council, has been presented to the Chelsea Public Library by Miss Mary Grant, sculptor, of Tite-street, Chelsea. Mr. Firth was from 1876 to 1879 a member of the Chelsea division of the School Board for London, and M.P. for Chelsea from April, 1880, to November, 1885.

The Sunday-schools attached to the Ebenezer Methodist New Connection Chapel, Newcastle-under-Lyne, are being rebuilt from plans by Mr. J. Lewis, architect, Newcastle. The girls' school will comprise seven classrooms, accommodating 245 scholars, and on the site of the lecture-hall a boys' school, also containing seven classrooms, and capable of accommodating nearly 190 children, will be constructed. Above this room will be a lecture-hall seating 400 persons. Mr. J. Bagnall, of Fenton, has taken the building contract for £1,300.

The city council of Canterbury have adopted plans by Mr. A. J. Jennings, of that city, for providing a lunatic asylum accommodating 200 pauper patients and 50 private patients. They have appointed Mr. Jennings as architect at a remuneration of 5 per cent on the actual cost, but in no way to exceed that percentage on the estimated cost, £60,000. The site will cost an additional £10,000.

The Directors of the Maidstone Waterworks Company have decided to vote £3,000 to be divided among those sufferers from the recent typhoid epidemic in the borough who have received no pecuniary or other help from the relief committee, and who had threatened to bring a combined action against them. The claimants have accepted the offer of the directors.

The parish church of Manafon was reopened on Wednesday week after repairs and renovation. The walls have been repaired, new floors laid, the entire church reseated in oak, and new heating apparatus, lych-gate, eagle lectern, and chancel screen provided. The work of restoration has been carried out by Messrs. J. Ward and Sons, Uttoxeter, under the superintendence of Messrs. Douglas and Minshull, architects, Chester.

A strong feeling has been manifested throughout Lincolnshire lately against the proposal to erect a stained-glass window in Lincoln Cathedral in memory of the late Poet Laureate, on the ground that such a memorial would be totally inadequate. At a meeting of the committee the proposal has been abandoned, and instead it has been decided to erect a statue of Lord Tennyson in Lincoln.

The new public baths and washhouses for Deptford, built at a cost of £10,000, were opened by the Lord Mayor on Wednesday. Mr. Thomas Dinwiddy is the architect, and Mr. H. L. Holloway the builder. We illustrated the building, which faces New Cross-road and Lauric-street, in our issue of Oct. 18, 1895.

Our Office Table.

The Metropolitan Tabernacle in Newington Butts, which was reduced to roofless walls by the disastrous fire of Wednesday afternoon, was built between 1859 and 1861 from plans by Mr. W. Wilmer Pocock, who is now the senior Fellow of the Royal Institute of British Architects. The contractor was the late Mr. William Higgs, and the cost, apart from special gifts, was £31,000, all of which was raised by the opening day. The building was only insured for £12,000. In the area and two galleries seats were provided for nearly 5,000 persons, it being the largest Non-conformist chapel in the United Kingdom. There was no heating apparatus, as such, ever placed in the chapel, the late pastor having had, it is said, a strong objection to any such arrangement, so that the only source of fire was the part of the basement used on this occasion for cooking. The fire, which is attributed to the overheating of a kitchen flue, broke out in the south-east corner of the upper gallery, and owing to the large amount of timber employed in construction spread with great rapidity. The church records and valuable portraits were fortunately saved. It is announced that no time will be lost in reconstructing the building. The site is a freehold one, having been purchased from the Fishmongers' Company, whose almhouses previously stood thereon.

Arrangements have been made for holding at the South London Art Gallery (Lord Leighton Memorial), Peckham-road, S.E., a series of special collections, of which the first, to be opened to-morrow, will be a collection of Japanese colour prints, with a demonstration by Mr. Morley Fletcher on the methods of printing in colour from wood blocks. The gallery is open from 2 p.m. to 10 p.m. on week days, and from 3 p.m. to 9 p.m. on Sundays. The ordinary collection is, in a sense, "permanent," though, as the pictures shown are mostly lent, they are continually changing. It is thus quite distinct from the short loan exhibitions held in various parts of London at this time. In addition to the picture gallery there is a museum filled with technical objects of artistic interest.

Under the title of "Ancient Southampton," a most interesting exhibition of works of art illustrative of ancient Southampton has been opened at the Philharmonic Hall, of that town, by Mr. William Burrough Hill, F.S.I. This gentleman has generously thrown open his collection free to anyone on the presentation of his card. The catalogue we have received shows the extent and variety of this collection, and is an admirable incentive to others to collect and exhibit when occasion requires any interesting pictures, drawings, or etchings of their native town. There are 228 works that have been hung, including a valuable collection of oil-paintings, water-colour, and pencil drawings by a well-known local artist, J. G. Hart; water-colours by W. M. Cooper; several interesting engravings by the late Philip Brannon. Works by Tobias Young, William Strayersen, and David Low are also to be found in the collection. We wish Mr. Burrough Hill every success in his praiseworthy attempt to maintain the landmarks of this ancient town, which are unhappily fast disappearing. In this way alone can we hope to preserve the records of old towns which are now under the remorseless grip of the speculative builder and land-grabber. It would have added to the value of the catalogue if the dates when the drawings were executed had been given.

Some interesting figures are given in the April number of the *Labour Gazette* as to the number of urban sanitary districts in which the contracts entered into by the local authority for the execution of works specify any conditions as to the wages to be paid by the contractor, or other conditions with respect to the persons employed by him. If London is added, the whole of the urban districts in England and Wales may be divided into two groups, of which the first, with an aggregate population of about 13,000,000, includes all districts in which the local authorities impose conditions of some kind as to wages in their contracts; and the second, with a population of about 8,000,000, includes all districts in which such conditions are absent.

The spring meeting of the Iron and Steel Institute will be held in London at the Institution of Civil Engineers on Thursday and Friday, May 5 and 6, under the presidency of Mr. Edward P. Martin, of Dowlais. The Bessemer gold medal will, in accordance with a wish expressed by the late Sir Henry Bessemer, be awarded to Mr. R. Price-Williams in recognition of the active part he took in the early days of the use of steel on railways. Mr. A. Greiner, director-general of Cockerill's works in Belgium, will give an account of his experience of the use of blast-furnace gases as motive power. Mr. Charles Cochrane will read a paper on blast-furnace practice, showing that with ore containing 2 per cent. less iron, and with coke containing 2 per cent. more ash, he is working with as great economy as he did 15 years ago with better material. Mr. J. H. Darby will deal with coking in by-product ovens, Mr. F. Radcliffe with steel forging, Mr. R. Price-Williams with steel permanent way, and Mr. H. Bauerman with the iron industry of the Urals. Other papers are promised by Mr. J. E. Stead, Mr. C. H. Ridsdale, Mr. E. H. Saniter, and the Austrian metallurgist Baron Jüptner von Jornstorff.

There would seem to be a fair prospect for the use of wood-pulp in floor cloth in the near future. Perfect success has not yet been obtained; but those who have it in hand seem to be pretty sanguine of the result of their labours. As to taking colour, the patterns as yet obtained in shades of pale grey up to dark olive worked out in diamonds; but probably any number of tints may be retained on the wooden surface—when the composition of the fabric is perfected.

Excavations are in progress in Ephesus, under Dr. Rudolf Heberdey, of Vienna. A theatre of the Roman period has been laid open having an auditorium of three rows of seats and an orchestra. A well-house of Ionic style in its neighbourhood had a fountain adorned with lions' heads as its waterspouts. In the rubbish with which the well-house was choked the workmen found masses of earthenware lamps, fragments of terra-sigillata, a statue of Nemesis, and a griffin. Traces of magnificent buildings of the year 263 before Christ have also been discovered.

The chapel in the north transept of Ely Cathedral which has been fitted up for private prayer by Canon Stanton, was dedicated on Easter Tuesday. It has been provided with a reredos designed by Mr. J. A. Reeve, and executed by Messrs. Farmer and Brindley; the subject is Our Lord as High Priest and Redeemer. The screen which stood here till the repaving of the north transept in 1876 has been replaced; it is, probably (except the top), of the 14th century.

The estates of Redland Lodge and Redland Knoll, Bristol, properties adjoining each other and close to the border of Durdham Down, were, owing to the deaths of their former owners, recently sold, and the purchaser has laid out the land, about nine acres in all, for building a superior class of residences. Four roads called Belvidere-road, Blenheim-road, The Quadrant, and The Glen are in course of formation, and the district will be known as Redland-gardens. Mains will connect the civic electrical supply with the new roads, which are being constructed, under the direction of Mr. Herbert F. Jones, architect, of Bridge-street, Bristol.

The Rev. W. L. Watkinson, president of the Wesleyan Conference, formally opened a new Wesleyan school chapel in Market-street, Holyoake, to take the place of the old chapel situated at the far end of the village, and built some 40 years ago. The new premises are in the Gothic style, of red bricks, with elaborate stone dressings. The total cost, including the purchase of the site, was £2,300.

The monthly memorandum of the Labour Department of the Board of Trade states that the number of unemployed in the trade-unions making returns was at the end of March 3·1 per cent., compared with 4·4 per cent. in February and 2·5 per cent. in March of last year. Employment in the building trades remains good, the percentage of unemployed union members being 1·6, compared with 1·7 last month, and 1·2 per cent. in March, 1897. The furnishing trades have still further improved and are busy. The percentage of unemployed union members at the end of March was 1·3, compared with 2·8 last month and 0·7 in March, 1897.

The Plymouth Corporation on Monday received a communication from the Admiralty with reference to the proposal to develop Cattewater Harbour at a cost of nearly £700,000. The Admiralty consider the scheme would prove prejudicial to the naval interests of the port, and state that the removal of one or two shoals in Plymouth Sound, and certain conditions, with reference to the regulation of traffic in the Sound, would be indispensable to the Board's acquiescence. As these alterations in the scheme would involve an expenditure of an additional two hundred thousand pounds, the Bill now before Parliament will probably be withdrawn.

MEETINGS FOR THE ENSUING WEEK.

Saturday (to-morrow).—St. Paul's Ecclesiological Society. Visit to St. Margaret's Church, Lothbury. 3 p.m.
Edinburgh Architectural Association. Visit to St. Mary's Cathedral and Wester Coates House. 2.30 p.m.

Monday.—Society of Arts. "Sources of Commercial Indiarubber," Cantor Lecture No. 2, by Dr. D. Morris, C.M.G. 8 p.m.

Tuesday.—Institution of Civil Engineers. Annual Meeting of Members. 8 p.m.

Wednesday.—Society of Arts. "Photography and Colour Printing," by Capt. W. de W. Abney, C.B. 8 p.m.

Thursday.—Society of Arts. "India and her Currency," by Sir Edward Sassoon, Bart. 4.30 p.m.
Society of Architects. "The Decorative Use of Mosaic in Architecture," by Messrs. Diespeker and Co. St. James's Hall, Piccadilly. 8 p.m.

Friday.—Architectural Association. Members' Soirée and Smoking Concert. Café Monico, Piccadilly-circus, W. 8 p.m.

The Society of Architects.

Founded 1884. Incorporated 1893.

The SIXTH ORDINARY MEETING of the Society of Architects for the Session 1897-98 will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, April 28th, 1898, at Eight o'clock p.m., when a Paper has been kindly promised by Messrs. DIESPEKER and CO., entitled "THE DECORATIVE USE OF MOSAIC IN ARCHITECTURE."

ELLIS MARSLAND, Hon. Sec.
MONTAGU BALDWIN, M.A., Sec.

CHIPS.

The town council of Hyde have raised the salary of their borough surveyor from £250 to £300 a year.

The Diamond-Jubilee Nursing Institute in Walsall-road, Wednesbury, was formally opened on Tuesday. It has been built from plans by Mr. Joynson at a cost of £1,450.

At Worcester, on Tuesday, a new nurses' home to be used in connection with the general infirmary, was opened by Lady Mary Lygon. Mr. Lears Sheppard was the architect, and Messrs. J. S. Wood and Son were the builders. The cost has been £4,500.

On Wednesday in last week, the church of St. Mary, Gosforth, Cumberland, was reopened after restoration, having been almost entirely rebuilt at a cost of £3,000. A Scandanavian cross, dating from the 7th or 8th century, stands in the churchyard. It is about 17ft. high. Two curious hog-back or coped gravestones have been discovered and preserved, which were excavated from the foundations, as were also several 14th-century grave crosses. Two 12th or 13th-century north and south doorways also came to light.

At St. James's, Walthamstow, on Thursday in last week, new Sunday-schools and a parish-room, built at a cost of £2,400, were dedicated by Archdeacon Stevens.

The Early Perpendicular parish church of Broadhempston, near Totnes, was reopened on Wednesday week after restoration. The work has been under the direction of Mr. Edmund Sedding.

The foundation-stones of an Independent Methodist mission church, Kendal-street, Wigan, were laid on Saturday. The church in course of erection is in the neighbourhood of Frog, Woodhouse, and Gidlow-lanes, and is being built by Messrs. Joseph Wilson and Son at a cost of over £585.

At the meeting of the Derbyshire County Council held at Derby on Friday, the report was considered of the asylum committee, who asked for a sum of £42,840 for the purposes of extensions and improvements at Mickleover Asylum. It is proposed to make a provision for 750 patients altogether, and then to stop the extensions at Mickleover, and if necessary to build a new asylum in another portion of the county. Mr. Alderman Waite criticised the estimate adversely, alleging that it was very excessive. The cost worked out to £161 per bed, as against £107 in the case of the Derby Borough Asylum. He moved an amendment to the effect that the matter be referred back to the committee. After a long and animated discussion, the amendment was carried by 23 votes to 15.

Mr. Alfred Young Nutt, surveyor to the Dean and Chapter of St. George's Chapel, has been appointed clerk of works at Windsor Castle. Mr. Nutt 15 years ago designed and carried out the restoration of the exterior of St. George's Chapel, and he has recently been engaged on several works of art for the Queen and Princess Henry of Battenberg, including the memorial to the late Prince Henry of Battenberg, erected in Whippingham Church.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2260.

FRIDAY, APRIL 29, 1898.

ARCHITECTURE AT THE ROYAL ACADEMY.—I.

THERE seems, on the whole, to be less mediocre work in the gallery devoted to Architecture than of late years at Burlington House, though the visitor will experience no difficulty in discovering a few atrocities which are devoid of even a mere degree of cleverness, while it is no injustice to say that some of the exhibits are absolutely poor both in drawing and design, or else they are entirely uninteresting and commonplace.

Before concluding our notes we will justify these remarks by quoting instances, because the architect Academician who made the final choice ought to have excluded such things, seeing that several really good drawings of clever buildings were turned away on the stereotyped plea of "want of space." Though there may be nothing which will permanently rank as a really great work of art of the first order in the architectural room this year, it must, nevertheless, be acknowledged that the collection, as a whole, includes many spirited and ambitious designs which serve to make the show interesting. Possibly the best things are among the minor exhibits, for in these things there is less chance of going wrong.

The gallery contains no drawings by either Mr. Norman Shaw, R.A., or Mr. Alfred Waterhouse, R.A.; but Mr. T. G. Jackson, R.A., exhibits his diploma work, the New Schools, Oxford University, besides the New Domed Chapel of Giggleswick School (1647), and some more school buildings at Uppingham (1648). Of the three compositions the chapel is by far the most original and capable, marked, as the design is, by a freedom from precedent at once masterly and unmannered. These qualities seem to be wanting in the University Schools, though by reason of size and distribution of plan their grouping is, of course, important and dignified. The design, too, is also richly detailed in a suitable style. For all that, the propriety of "the High" is too evident, and the respectably correct element, which dominates the conception, robs the building of those higher qualities naturally expected in the diploma work of an ambitious Academician. The only other R.A. who exhibits is Mr. George Aitchison, and his single frame shows in section some refined decorations in marble mosaic and paint, tastefully proposed for a private chapel surmounted by a dome (1604). Mr. G. F. Bodley, A.R.A., sends a very nice drawing by Mr. Raffles Davison, of the east end of Chapel Allerton Church, near Leeds—an exceedingly long building, with a detached tower of square proportions, very simple and reserved in design. The chancel window is flanked by niches containing statues, and its Decorated English tracery is set off by a breadth of wall space in the gable end, which is rather refreshing. Mr. Bodley has designed a pulpit, too, for St. Michael's Church, Croydon (1714), giving it a spire-like canopy of florid wainscot elaboration, confined within simple lines, and surmounted by a statue of the Archangel. This work is shown by a bright pen-and-ink elevation. It is fairly evident that Mr. John Belcher has some very influential friends at the Royal Academy, for he has no less than six exhibits, which, taken together, must cover a large amount of coveted wall space. Foremost among these hangs his design for the new Guildhall façade at Cambridge, with its ill-proportioned columns and queer detail, perhaps the worst thing of its size and character shown of late by so capable an architect. We can hardly imagine a more incongruous design, and think the ball terminals over the pediments of the end towers are most ungainly. Mr. Belcher's work has sometimes been so clever, and it is always marked, we readily admit, by an endeavour to do something fresh, so that onlookers can but wonder, after seeing this elevation and his Colchester Town Hall (1756), what vagary is next to be displayed. The Colchester design seems to have been considerably modified since the competition, and is here shown by a fresh drawing, a capital water-colour of much ability by a well-known hand. The big tower which distinguishes the grouping sits badly at the angle of the building, rising in an awkward and ill-considered way out of the roof close to the hip. The fenestration looks over-large in scale in the façade, and the main windows are flanked by the same lankily-shaped columns as before mentioned, while at the corner both elevations lack solidarity and breadth under the weight of such a tower. The details of its crowning stage exhibit taste and ability. The seated figure in front is probably sufficient for a show drawing such as this (1743); but it has been seen somewhere, surely, before. However, good sculpture is to be always welcomed—and we know that this is Mr. Belcher's intention in this case. We have nothing but praise for his interior of the Entrance Hall to a House at Pangbourne. It has a square, simple vault, enriched with plaster strap-work and panels. The whole effect is pretty and effectively quaint without effort. As to the exterior of the same mansion (1753), we do not like it a little bit. The design is scarcely more than a hotch-potch of ugly parts, and it shows how unequal Mr. Belcher can be. What is there in common, it may well be asked, between the garden-front pavilions and the flatly hipped roofs of the main building which they flank? Again, no one can fail to remark how ill-fashioned the central pediment is, rising over two canted bays. Call it Later Renaissance, or what you will, this, after all, is not good architecture; and then, too, how can anyone admire the poorly grouped squat tower in the hinder-parts of the composition? We have devoted this much space to Mr. Belcher's exhibits because the authorities evidently think very highly of them to the exclusion of other designs, and because, whatever their demerits, these productions of Mr. Belcher's at any rate may rank as departures from the ordinary and commonplace, a remark which means a good deal. At least, they challenge criticism. Malvern College Chapel is the single work shown by Sir Arthur Blomfield, A.R.A., and this interior of his may be taken as a typical example of a thoroughly scholarly architect's multifarious designs, always admirable from the client's standpoint and good in a popular sense as tasteful and satisfactory buildings. Mr. Aston Webb's work this year is represented by three samplers, and when, as in this case, all are successes, it is not necessary perhaps to express a preference. The Yacht Club, village shops, and other premises at Yarmouth, Isle of Wight (1762) make an uncommonly picturesque group, beautifully delineated by Mr. Davison. This architect's sense of fitness is admirably exemplified in these waterside buildings; an observation which, with equal truth, is applicable to his Greenwich Grain Silo (1774), a design of exceptional merit, which, however, failed to find a place in this same gallery last year. Hildon House, Hampshire, another characteristic work by Mr. Aston Webb, is represented by two perspectives crisply drawn with close attention to detail, even though they fail somehow to set these capable compositions off to the best advantage. Perhaps the work itself is lacking in the contrast of repose only to be secured by the use of broad wall spaces. "Okewood," Sussex (1609), by Messrs. Ernest George and Yeates, is a small house, and altogether less ambitious; but it illustrates the breadth of design just suggested. To compare the two buildings of such different aim would, however, be meaningless. The same architects exhibit the fireplace and bookcases of the library at North Mymms, Herts (1608), a richly-treated mansion by Mr. Ernest George, which we illustrated a few years ago. The two largest undertakings in the Architectural room this year hang one over the other, and by reason of their importance as comprehensive building schemes must attract much attention. The first of these is the selected design for the Royal Masonic Institution for Boys at Bushey (1632), by Messrs. Gordon, Lowther, and Gunton. We illustrated this same drawing in the BUILDING NEWS on March 11. The other is Messrs. Lanchester, Stewart, and Rickards' selected design for the Cardiff Town Hall and Law Courts. Mr. Rickards's drawing here exhibited is a skilful performance, and shows the entire group in a comprehensive way; but in spite of the originality and ability of the design, we still feel unable to acknowledge the wisdom of Mr. Waterhouse's choice. Our space to-day leaves us no more room for further references, though we welcome Mr. Mountford's model of part of his Liverpool Technical School and Museum Building (1804). It helps the better understanding of the view (1782), which, if we remember rightly, he sent to Burlington House unsuccessfully last year. The same architect exhibits St. Michael's Church, Southfields, S.W. (1802), which looks a very nicely designed piece of work. One of the most satisfactory of all the buildings represented is Roedean School (1685), by Mr. J. W. Simpson, a very large establishment now in course of erection between Brighton and Rottingdean. It is uncommonly well designed, simple, picturesque, and dignified.

PICTURES AT THE ROYAL ACADEMY.

[FIRST NOTICE.]

WITH a few brilliant exceptions, the pictures in the exhibition of Burlington House, to be opened to the public next Monday, are of the kind which appeal to popular sympathies and to the general picture admirer. As on previous occasions, we shall merely glance here at a few of the principal works in the first three or four rooms before we take up in order the several galleries. Landscape, seascapes, portraiture, and works of *genre* take up by far the greater portion of the walls, while of historical or ideal subjects there are not many of any great merit. Examples of "cults" do not find favour at the Academy, though here and there one may see methods almost as audacious as those of men of the school to which Arthur Melville belongs. But colour harmonists, visionists, or experimentalists are not popular.

As in most Academies, we see many pictures that portray neither nature nor history nor commonplace incident, but can only be classed as enigmatic or symbolic, in which the painter with a consummate sense of the subtle or the harmonious or the mere technical idealises. These painters are not without their place in art: they seek to give us visions of beauty that appeal only to a higher plane, but are not understood by the many. We see two subjects of this kind in the New Gallery, by M. Khnopff. Sometimes it is a portrait decoratively treated like Mr. Gotch gave us last year in his "Heir to all the Ages"; sometimes it is a superb scheme of colour; sometimes it is a mysterious composition suggestive rather than descriptive. These men are non-realists, and depend more

on subtle forms or hues or exquisite finish than upon any natural kind of art. In the first gallery the first great picture that arrests attention is Briton Rivière's "The Temptation in the Wilderness" (22), where the solitary white-robed figure of our Saviour, His head bent low, kneels on the summit of a rocky plain. His vesture is illumined by the departing light of a sunset which is seen on the distant horizon. The scene depicted is like a dark, desolate sea of billow-like rocks, on which kneels the solitary figure of Christ. There is power and pathos in the picture. "The Magic Crystal," by Fred Stead (4), a girl in green dress, holding in both hands the magic ball which she is closely examining, and which she has just taken from a casket, is painted with much poetry. The colour is admirable. One picture by H. W. B. Davis, "A June Evening," is in this gallery. It represents a beautiful landscape, brightened by gleams of the warm sunset and with blossoming trees. Cows are wending their way homeward. In the third gallery this painter has another charming subject, "On the Upper Wye" (221), and a very beautiful landscape in the fifth gallery, "Under the Greenwood Tree" (387), which we shall notice later on. H. H. La Thangue, in his "Nightfall" (29)—gleaners in a cornfield, a moonlight study—is worthy of his last year's work, and we must just notice, in passing quickly through this gallery, a view of "Newcastle-on-Tyne," by Niels M. Lund, a grand study of smoke-laden atmosphere over this city of the north. Mr. Lund has invested the murky city of Newcastle with a poetic charm of its own. Vapour and smoke in his hands are made to assume a beautiful canopy of light and gloom, here throwing into strong relief the buildings and steeples, and there lighting up with visionary splendour the squalid streets of a busy centre of human life and industry. Another important picture is J. W. Waterhouse's "Flora and the Zephyrs" (64), a delightful and flower-strewn mead near a river, dotted with violets, in which a pathetic-looking maiden is being ministered to by aërial damsels, who are entwining her with a garland of white roses, while her fair attendants are grouped round her. The wistful countenances of the fair maidens and the subdued colours are thoroughly characteristic of this painter's work. The same faces appeared in the painter's St. Cecilia and his last year's picture of "Hylas and the Nymphs." A capital portrait of Mr. Francis Cranmer Penrose, P.R.I.B.A., by John S. Sargent, and a graceful portrait of Grace, wife of Mr. H. Passmore Edwards, by E. Constable Alston, must be noticed here. Also a fresh work by J. C. Hook, "Idlers" (70), and a pleasing piece of *genre* by F. D. Millet, which we must notice in detail. In Gallery II., the principal position is occupied by a noble Shakesperian subject by Edwin A. Abbey, quite equal to his last year's "Hamlet." We must reserve our description and critical examination for next week. The scene depicted is "King Lear, Act I., Scene 1" (138), where Cordelia is leaving her sisters:—

> Ye jewels of our father, with wash'd eyes
> Cordelia leaves you. I know you, what you are;
> And, like a sister, am most loth to call
> Your faults as they are named. Love well our father.
> To your professed bosoms I commit him, &c.

The composition, costumes, rich but subdued colour, black and scarlet, the graceful figures of Lear's daughter, clad in the daintiest robes, make this another triumph of this great American painter. But greater than all these pictorial and technical qualities is the pathos and dramatic power which Mr. Abbey has imparted to his work.

Fredk. Goodall's Oriental scene—a harem interior—entitled "A Gilded Cage," is rather hackneyed, though clever as a work of technique. Stanhope A. Forbes sends a very admirable and pathetically-painted subject more unambitious than usual. "October" is the title, and must be taken, of course, in a figurative sense. An aged woman and young girl have come down the steps of the raised churchyard. Other pictures of interest here are W. Logsdail's Venetian subject, "Going to the Procession"—a little girl attired in white, with a wreath of flowers and basket of rich blossom on her arm, crossing the canal bridge with her mother.

In the third gallery, the president, Sir E. J. Poynter, has an important classical subject called "The Skirt Dance" (222), which occupies the position so often given to Leighton's chief works. We are inclined to say at a first glance that this work is one of the most successful we have seen. In a sumptuous alcove adjoining the vestibule of a Roman palace, a young girl clad in diaphanous tissue of light salmon tint is dancing before a patrician lady, richly attired and jewelled, and her female friends and attendants, who are seated on a white marble bench which encircles the interior. The richest marble columns with gilded bases surround the alcove, and the floor on which the maiden is dancing is of tesselated marble. Beyond one see glimpses of a garden and a spacious columned hall. There is poetry of motion and grace of line and drapery in the dancing girl, which atones for much of a certain technical exuberance and hardness. The lady and her companions looking on, a girl with dice on a seat, and two maidens reclining in conversation make up a picture of interest. A chaplet of roses has been thrown at the dancer's feet. George H. Boughton has a large picture from the "Lady of Shalott," "The Road to Camelot." It is painted in a light colour, depicting Tennyson's poem:—

> And moving thro' a mirror clear
> That hangs before her all the year,
> Shadows of the world appear:
> There she sees the highway near,
> Winding down to Camelot.

The painter represents the passing scene, the river, the "surly village churls," the "market girls," a troop of damsels, a crimson-clad page with his dog, and in the distance beyond the river knights on horses "riding two and two." J. W. Waterhouse's "Ariadne" (211) represents the daughter of Minos, who fell in love with Theseus, reposing on a couch in a garden by the sea. She is partially draped in scarlet, open at her bosom, her hands behind her head. Leopards crouch underneath and near her. The composition and colour are admirable. On the opposite wall Alma-Tadema has his only picture, "The Conversion of Paula." Unsurpassed in its technical qualities, this picture is perhaps less attractive than many others which have preceded it. Paula reclines on a marble seat, one arm resting on the parapet, while she is listening attentively to the youth behind her who is pleading his faith. It is a brilliant and beautifully-executed subject. Paula is a daughter of one of the Gracchi. Her long oval face is not exactly beautiful, but is painted with extreme care, while her companion is tonsured, and has a purple or dark blue robe.

We have, as usual, the elements of the painter's classical compositions—marble, transparent tissues, and subtle colour. A white marble terrace or balcony faces the deep-blue sea, illumined by strong sunlight; a marble staircase leads to a temple. Paula, with auburn tresses and jewelled diadem, reclines beside an altar devoted to Bacchus, decorated with a silver vase; she is attired in rich russet and amber tissues shot with gold, and displays all the beauty of a Roman lady of this luxurious period. She is depicted attentively listening to the handsome and austere young saint, robed in dark blue and white, who holds a scroll, and is persuasively pleading with the fair maiden, who seems to realise the truth of his argument. The embroidered dress of the young saint and the sensuous beauty and sumptuous attire of the beautiful convert are, it is needless to say, limned with marvellous skill.

Of other pictures, we must mention briefly B. W. Leader's landscapes. "In a Welsh Valley" (188) is a beautiful scene, with a mountain background, which catches a soft light; and in the next gallery we have two more of those placid and brilliant renderings: "Where Peaceful Waters Glide" (309) and "The Silver Sea" (314). In the former, a clear and transparent atmosphere, the hill tipped by sunlight, and placid water; the latter is a tract of sandy beach, with grassy hillocks, and a silvery sea gently breaking on the shore. Hubert Herkomer's great centre picture, "The Guards' Cheer"—an episode of the Diamond Jubilee Procession—(198), is an ambitious picture. The scarlet uniforms of the guards, and their lusty cheers are realistically depicted. John Brett has one of his finest efforts, "Trevose Head, Cornwall" (194), a coast scene. There is freshness and beautiful colour in the sea and breaking waves. J. MacWhirter also, in "Morning, Isle of Arran," paints an unclouded coast of exquisite colour: a vast bay reflecting the ocean sunlight between rising hills of verdure.

W. Q. Orchardson sends four pictures. No. 243, "Trouble," is a touching incident, rendered with that harmony of amber tones and sumptuous surroundings that distinguish his renderings in high life. We are left to conjecture the meaning of "Trouble." Prostrate with grief is a young man in black, his head buried in his arms resting on a rich ormolu table; the young wife behind him, attired in elegant evening robe with long skirt of delicate shade of salmon and low bodice, has one hand on the back of his chair, and is turning her face towards him in pity. A little bunch of flowers, a fan, and gloves lie on the table beside the young husband, and on a chair near is a white fur cloak. In the distant part of the room is a pink-shaded lamp. The spectator is left to imagine what the trouble is, but it may be in the written letter or document which lies beside him. The painter, in his customary simple, but elegant and refined manner, tells the tale only too clearly and dramatically. The interior is one of those elegant Louis XVI. drawing-rooms we have seen so often before, richly carpeted and furnished. His other works are portraits—that of Miss Fairfax Rhodes, in very delicate dress and colour, is extremely graceful as an example of portraiture. A skilfully painted and pathetic picture is "Sunshine and Shadow," by Gwilt Jolley (266), a funeral procession in some Italian city, headed by the cross-bearer and followed by the priest and mourners, preceding a handsome casket overladen with flowers. Behind the rising city is bathed in sunshine, while the foreground and procession are veiled in a haze. The rich vestments of the priest, and acolytes are well painted. One of the most sumptuous figure subjects is Frank Dicksee's "An Offering." Rose-colour, white silk brocades, and golden tissues are, it is needless to say, predominant in this composition. The subject represents a dark haired gallant offering a silver cupid to a beautiful girl in white brocaded satin, who is seated on a handsome chair beside him. The lady is most richly attired, and wears a pearl necklace and rich jewelled brooch. Round her the rose lining of her cloak sets off the faultless and glistening whiteness of the low satin dress, and behind her hang gorgeous hangings. Mr. Dicksee has exceeded himself in this picture of fair beauty and richness of colour. Very graceful is Arthur Hacker's portrait of "Mrs. Samuel Butler" (279), and we must also notice the two seascapes of J. C. Hook, whose fresh coast scenes generally adorn this side of the large gallery. "Trouble with the Old Muzzle-Loader," and No. 278, illustrative of some lines by Matthew Arnold, are both fresh and full of sunshine and colour. George W. Joy's large canvas over the President's picture "Christ and

the Little Child," illustrating St. Luke ix. 47 and 48, is not a success. We must notice in passing Peter Graham's fine "Moorland Quietude," and Edwin A. Abbey's picture of "The Bridge" (234), a quaintly-conceived work. The painter's knowledge of costume and historical incident is aptly brought out. The scene represents a Mediæval bridge opposite a sombre fortress-like building or monastery seen against a sunset sky. Monks singly and in groups are crossing the bridge to the monastery, while a parti-coloured jester is playing a mandolin, seated on the corner of the bridge; by his side, in the parapet, are two apples and his bundle. There is a pleasing quaintness and contrast in the picture, which places it above modern everyday incident.

THE NEW GALLERY.

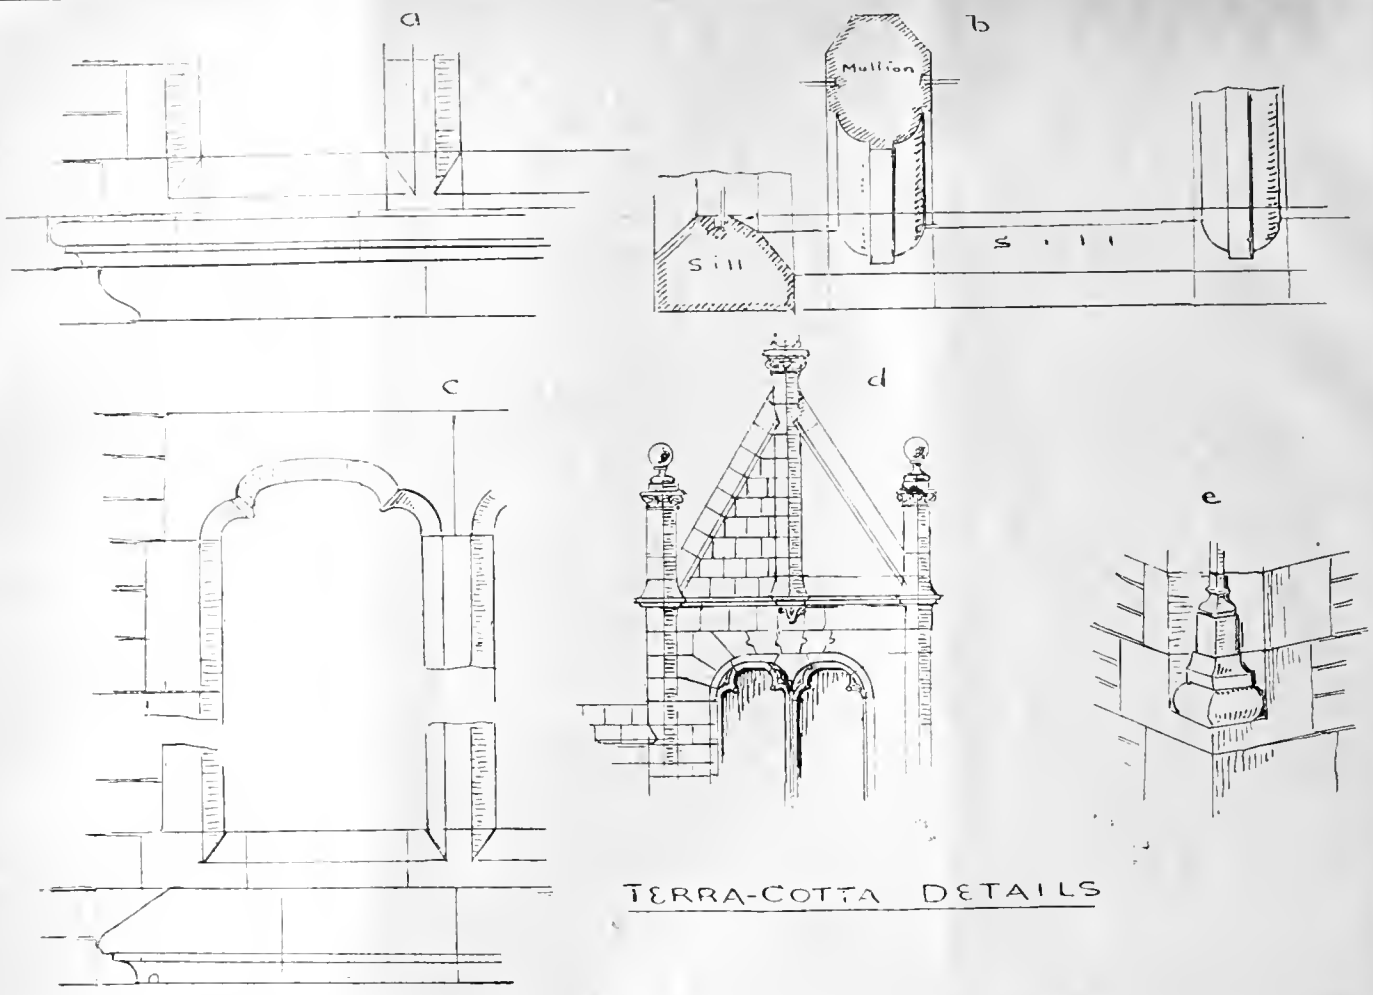
THE pictures at the New Gallery are very diverse in character and treatment, and there is a strong sprinkling of the "advanced" school of all ranks and degrees. Here we can only name a few of the more important features of the exhibition, and it will be difficult to say which are the chief pictures among so many works of admitted masters. The most ambitious in the South Room is the tall, upright canvas by G. E. A. Abbey, A.R.A. (39), "A Poet," a rather wide title. The poet in this subject is dressed in a loose white robe, and is reciting to a group of ladies his composition, one hand holding up a bright red flower. The scene is some Florentine grove or vista of lofty cypresses, through which a flight of steps ascends. A red setting sun is seen through the dark foliage. On the right stands a circular temple, faulty in its architectural details. Well dressed ladies are seated or standing listening to the poet, and in rapt attention; but the theme is rather tame—certainly not equal to the scale attempted; nor to other and finer themes painted by Mr. Abbey, such as that in the Academy this year. Moffat Lindner's "Breezy Holland" (1) is a delightful piece of sea-painting, with its dappled waters and majestic clouds, bright and breezy. While at the end of the room is Walter Crane's large allegorical composition "The World's Conquerors," a gorgeous procession of valorous knights and ladies, Fame, Power, Beauty, Time, and Death taking part in the array. The design is ambitious, and there is ability shown; but the subject is somewhat hackneyed if instructive. There are many pre-Raphaelite pictures, two by Holman Hunt himself, and two by Sir E. Burne Jones, in other rooms; but here we note Harrington Mann's flatly-painted picture (4) "A Song of Spring," an orchard full of spring blossom, and a group of maidens seated or standing playing musical instruments. There is a true sentiment in the faces of the sisters, one clad in black with a crucifix suspended from her waist. Julian Story's "Song" (14), Madame Eames, as the Countess in the "Nozze di Figaro," is an exceedingly clever group, the lady singing to an accompanist at the piano, dressed as a courtier—admirable in composition and delicacy of colour. Alfred Parsons' "Sweet Williams" (31) and "The Back of the Village," an orchard of spring blossom and sunshine (35), Miss Flora Reid's picture of "Charity" (44), and Miss Annora Bromley-Martin's "Evening" (70), a procession of girls and women-gleaners trudging their way home by the side of a river, quite pre-Raphaelite—are pictures of undoubted merit. Alfred Hartley's "On the South Downs" (5), the crown of a hill "kissed" by a bright cumulous cloud, is a charming landscape. In the West Room Sir Edward Burne-Jones's large upright picture "St. George" comes opportunely on the feast of the patron saint; but it is scarcely more than a clever conventional treatment of St. George in armour with his mystic shield, and a landscape behind. Sir Edward's other subject "The Prioress's Tale" (82), is more characteristic of the painter's style and methods. There is a mediæval quaintness in the details of the priory precincts, the little child and the prioress are in keeping with Chaucer's quaint verse in the "Canterbury Pilgrimage," and quite pre-Raphaelite in feeling. "Early Spring," by G. F. Watts, R.A. (113), a little fair boy holding flowers which he has been picking, is hung at the end of gallery, and is a charming and expressive work, putting us in mind of Millais; while at the other end of room is a more mysterious but wonderful picture, "Can these bones live?" The visitor may ask the meaning of the gloomy landscape, the uprooted tree and broken branches that shelter the skeleton, or the drapery-like covering which partially covers the bones, near which are seen the tools and baubles of life—the cups, dice, and other relics of poor humanity. The composition in its mysterious solemnity is one of much power. Mrs. Alma Tadema's "An Impromptu" is a *bon bouche* piece of *genre*. J. M. Strudwick's Mediæval harmony, as we may call it, "Evensong," is full of detail and rich colour; Fernand Khnopff's "L'Encens" (76) is a delightfully delicate and symbolic study of a lady wearing an embroidered cope or cloak in silvery tones of grey, expressive of the flattered, and we may also notice his "Une Aile Bleu" as another enigmatic subject and clever piece of colour harmony. G. H. Boughton, R.A., has a cleverly painted and pathetic figure-subject, "When the Dead Leaves Fall" (116), a dark and beautiful woman walking through a shower of falling leaves in a wood; and near it Geo. Wetherbee's "A Spring Phantasy" may be noticed for its decorative beauty and delicate colour. A. D. Peppercorn's large, sombre landscape, "The Common" (136), and William Logsdail's brilliant Venetian subject, "The Market Boats," a delightful piece of drawing and colour (130), and the fine colour in Leslie Thomson's "Arcadia" may be mentioned. In the large gallery several remarkable portraits are to be seen. Byam Shaw's portrait, "Evelyn" (192), is a decorative experiment that may not meet general approval. The young lady, full length, stands in perfectly symmetrical pose against a golden background, in which the arms of the family are cleverly interwoven. It is painted with great care and grace; the dress is black, with a green fur-trimmed cape. Near M. Carolus Duran's portrait of "Joy," daughter of Lord and Lady Algernon Lennox, is a charming study of a flaxen-haired and delicately-featured little girl, executed with much finish. Then we have John S. Sargent's portrait of "Mrs. Thursby" (200). The lady seems to be leaning forward or rising from the chair, and the whole is forcibly painted, but is wanting in the reposeful qualities of portraiture. As for Arthur Melville's colossal canvas of "Mrs. Graham Robertson" (207), the less said the better. The scale and brushwork are alike extraordinary; but, then, it is the style of a new cult. J. J. Shannon's "Miss Berthe des Clayes" is a refined and delicate rendering of portraiture of a nice-looking girl leaning against a Japanese cabinet. Mrs. Swynnerton's "St. Martin's Summer" is symbolic—a ruddy face, blonde, enveloped in what looks like mists and vapour of autumnal hues. Alfred East's "A Mystic Pool," and (218) Thornewaite's large landscape, "The Deal and Dover Road" (237), with the gleaming line of chalk cliffs and sea and the wet lane along a fringe of trees skirting the coast, are very different—one dark and mystical, the other full of light, but both noticeable works. We have also the two delicate studies in white in Miss Mary L. Gow's favourite manner, "A Dance" (232), and "A Fortune." T. Austen Brown's "Grey Mare" is masterly and sympathetic, and we have another fine landscape in James MacWhirter's "Valley of Flowers, Murren" (247). The colossal canvas, "Too Late," by George Harcourt, from Christina G. Rossetti's verse (253), is more ambitious than successful. Holman Hunt's picture, "The Beloved," is a wonderful creation of the master of the great school of pre-Raphaelitism, though the over-florid colour almost spoils a face full of human emotion and tenderness. Mr. Ernest Parton, Alfred East, J. T. Nettleship, and other well-known painters send subjects. The Hon. John Collier's "Godiva" is a brilliantly-painted but rather hackneyed subject;—the rich and embroidered trappings of the charger are even more attractive than the fair rider herself, a young and modest girl.

MODEL SPECIFICATIONS.—X.

TERRACOTTA WORK.

THE employment of terracotta for architectural purposes is a large theme, and we desire here rather to point to what should be avoided rather than to the possible uses of this valuable material. And one of the first cautions is to avoid large projections—in other words, to keep the treatment rather flat. A heavy projection entails large blocks, with increasing difficulty of keeping them true; it also suggests the imitation of stone-work, both of which are objectionable. The over-lavish use of terracotta is one of the greatest mistakes our architects are making. This lavishness in its employment is disgusting the artist and the public alike, and will do more to cause a reaction in favour of stone or brickwork than anything else. No doubt this excess in its use is due largely to the comparative cheapness of the material. The architect who looks more to commission than to the art qualities of his buildings plays into the hands of manufacturers by using or specifying elaborate examples of ornament. He sees an illustrated catalogue full of patterns of enriched pilasters, friezes, pediments, string-courses, and the like, and at once, without considering the purpose or character of his building, he specifies them. It saves him trouble in designing in detail, and it does a turn to the maker. Let the architect pause before he selects an elaborate frieze, or string-course, or door-head, for instead of accentuating his design, it virtually destroys its repose and breadth. Let him keep this restraining caution in mind by asking: "Were I using stone instead, should I have this elaborate panel enrichment, or arabesque in the pilasters, or this very elaborate frieze ornament? Why should I have this string-course, or entablature full of acanthus-leaf, or egg-and-tongue or other enrichments, when I would not have them in stone? It is true terracotta is more durable, harder, and cheaper than soft stone; but am I not throwing away so much ornament in this or that position?" The great mischief of extravagant ornament is that it becomes commonplace and cheap, and, as in over-dress, destroys the very intention it was desired to promote—namely, richness of effect by contrast with plain surfaces. All repose and breadth is lost if we cut up a front or a gable with enriched pilasters and panels and friezes, and the lines of accentuation are sacrificed. There is a mania among builders and architectural "pot-boilers" to fill in panels and wall-spaces everywhere—a practice which defeats its purpose by producing confusion rather than effectiveness. Public-house and restaurant builders are adepts at this kind of artistic extravagance. Ornament should not be cast like stone is carved; undercutting should be avoided, and low relief is more adapted to the material.

In the design of terracotta work, the architect should remember that the material is limited to casting and moulding chiefly.



The clay can be moulded, however, direct by the artist. As to the difficulties of shrinkage in the kiln, the architect should find the necessary allowance to be made for the clay, and make his drawings to an enlarged scale. The material is liable to warp and twist, both in the lines and surfaces, and therefore the fine delicate members of Greek mouldings cannot be attempted. Bolder mouldings are necessary. Nor must the designer follow the treatment of stonework: the methods of treating stone are not suitable to terracotta. Thus deep undercut mouldings or ornament would be absurd to attempt in a moulded or cast material. Again, large blocks of stone cannot be imitated in terracotta, the jointing of which ought to be closer and more regular (see sketches of gables we give here). In a column shaft, for instance, the smaller and more regular the pieces are the better. Messrs. Doultons have introduced a new process of making terracotta in cellular blocks, which gives advantages. According to the ordinary manufacturer, all the skilled labour is expended in models and moulds, while the executed blocks are often inferior reproductions. Messrs. Doulton's method avoids this: each block of the clay is subjected to considerable pressure, and is like stone in density; it can be worked upon directly like stone while in a plastic state, with templates and squares, so that great accuracy is attainable, and shrinkage is an eliminated factor. Columns, architraves, string-courses, cornices, &c., can be turned out with the sharpest arrises. As no casting processes are employed, the drawings need not be prepared to a larger scale. According to this method also the cellular blocks are perforated horizontally, so that no filling with concrete is necessary, and the blocks are able to sustain considerable weights. We may here refer to the wedge-shaped joggle in flat arches and lintels as generally used. It is an old kind of joint, and is seen in masonry structures as well as terracotta, as in the Diocletian Palace, Spalatro, and in many foreign buildings. The French *crossettes*, as this contrivance is called, was no doubt introduced for the purpose of preventing the voussoirs of flat arches from slipping down. The joggle prevents this. In terracotta work, this plan, though perhaps not altogether to be approved in every case, is largely used, and we see very long lintels and flat arches and transoms jointed in this way. In a thin transom the joggle is perhaps almost necessary, unless a flat bar of wrought iron is introduced under the pieces, which is objectionable. Architraves and entablatures over intercolumniations are generally jointed in this manner, and when the pieces are truly moulded and the joggled joints accurately fit after burning, neat work can be produced.

In addition to clauses 1, 2, 3 in our last article, the following are special clauses that may be used before specifying any particular work in terracotta.

11. *General.*—The terracotta shall be buff (or red), well burnt and of even colour, subject to the architect's approval. No chambered block is to be less than 2in. thick. The surfaces are not to be coloured or washed, nor filed or rubbed. All hollows are to be filled in solid with fine lime concrete, the block being first soaked in water. No piece is to exceed 2ft. cube. The blocks to be well bonded with the brickwork, set in fine mortar, neatly pointed as the work proceeds, and cleaned down at completion. All the mouldings and arrises to be true in line, and sharp.

    The contractor (or clerk of works) is to assist the manufacturer in setting out any particular work, and to supply the modeller with a workshop. All damaged pieces to be replaced by contractor at his own expense. The manufacturer (or contractor) is to be responsible for any shrinkage, and for the size and accuracy of each block, and is to make the necessary allowance for same.

12. *Filling.*—The hollows of the blocks to be soaked in water, and afterwards filled with fine concrete in the proportion of 1 part by measure of Portland cement, 2 of sand, and 4 of clean, fine ballast to pass through an inch ring.

13. *Joints and Joggles, &c.*—The terracotta block used in arches, lintels, pediments, columns, &c. to be jointed in accordance with detail drawings, and to be chambered as required. The rebates, mortises, joggles, and grooves to be prepared before the burning, so as to require no subsequent filing or rubbing. All the pieces to be thoroughly bonded and coursed with the brickwork, and the contractor (or fixer) is to include any cutting, fitting, pinning, or bonding that may be required.

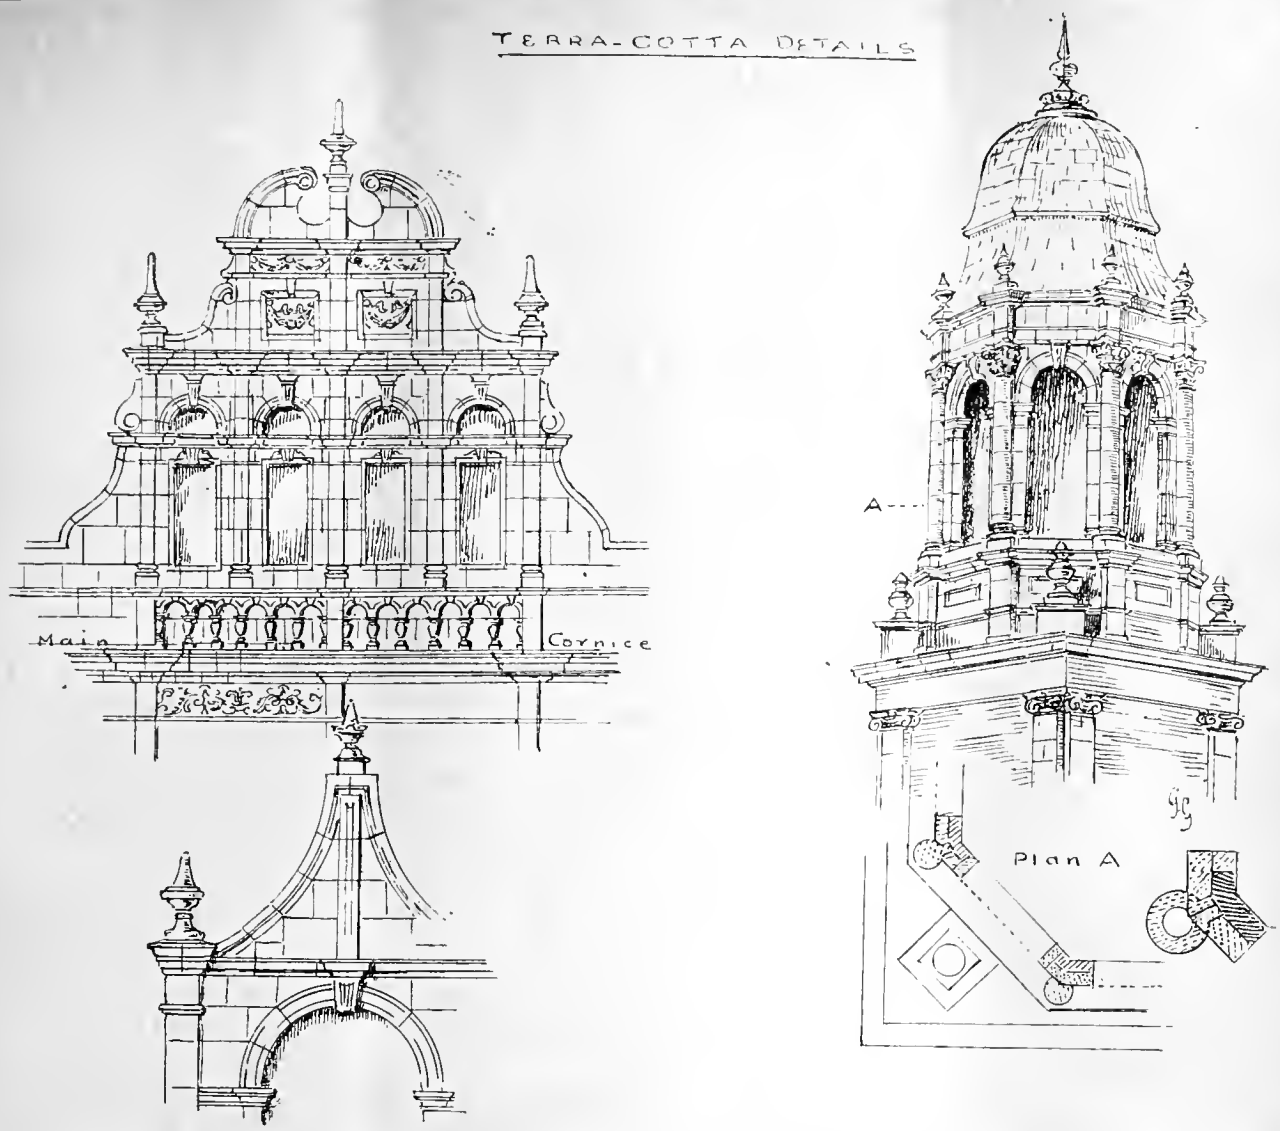
14. *Ornamental Terracotta.*—The ornamental or enriched pieces to be artistically modelled to the design, and to meet with the architect's approval before being fixed; the pieces to be turned out clean and sharp and equal to the models, well burned, and of even colour.

15. *Window Sills.*—The window sills (see sketches *a*, *b*, and *c*) to be of well-burnt terracotta, cane-coloured (or red), 6in. deep, moulded, grooved, and throated according to section, and to project 4in. (or 6in.) beyond the face of wall, with mitred ends set in cement, and pointed with coloured cement. The arrises to be sharp, and the mouldings true in line. Or—

    The sills to ground-floor windows to be moulded, weathered, and throated according to drawing, 6in. projection from face of wall, with mitred returns at end, bonded into brickwork set in cement, with joints not more than ¼in. thick, in coloured cement. The sills to have terracotta trusses underneath. All the blocks to be thoroughly burned, of uniform colour, and the arrises to be sharp and true when fixed.

16. *Window Heads.*—The window heads (shown in sketch) to be executed in terracotta, with joggled radiating pieces of the sizes shown in detail, and the jointing shown to be strictly adhered to (or, if without joggles, the radiating pieces to be dowelled together with cement); the frieze cornice over to be put together as shown, well pinned with cement into brickwork. The lines of mouldings to be true, and the arrises sharp. The whole to be set in fine mortar, the joints not exceeding ¼in. in thickness, and coloured to harmonise with the rest of the work (or neatly pointed as the work proceeds). The modelled ornament of frieze, the swags or figure groups on pediment, trusses, &c., to be approved by the architect before fixing.

    Any piece of terracotta which may be damaged for want of protection during progress of works, is to be removed by the contractor, and replaced by a perfect piece at the contractor's expense.



(Where the windows have mullions and transoms it is necessary to describe the manner or the size of pieces, see sketches *a* and *b*.)

17. *Mullions and Transoms.*—The mullions to be 4½in. (or 6in.) by 8in. (or 10in.) in section, and no piece is to exceed 9in. (or 12in.) in height, and the pieces to be set in fine mortar (or cement, or dowelled), and the vertical arrises and mouldings kept true and sharp.

The transoms to be jointed in accordance with detail drawings, or be put together in pieces with properly set-out radiating and joggled joints, set in cement mortar upon a frame or centre which is not to be struck till the work is finished.

The window (see sketch *c*) to have cusped window-heads made of terracotta and jointed over mullions as shown. (The head shown should not be longer than 18in. to each light; if longer, the head should be jointed in three pieces with joggles, as in the two-light window-head shown in our sketch for a dormer gable, *d*.)

THE SOCIETY OF ARCHITECTS' DINNER.

THE annual dinner of the Society of Architects was held on Thursday night in last week at St. James's Restaurant, Piccadilly, and was well attended. The President, Mr. Walter Emden, J.P., L.C.C., occupied the chair, and among the company present were the Earl of Jersey, G.C.M.G., Lord Welby, G.C.B., Hon. W. F. D. Smith, M.P., Sir David Evans, K.C.M.G., Mr. Ernest Bond, M.P., Mr. H. Atherley-Jones, Q.C., M.P., His Honour Judge Emden, the Rev. Dean L. G. Vere, Mr. Edward Bond (chairman Technical Education Board), Mr. Robert Walker, J.P. (ex-president), Mr. E. J. Hamilton (past-President), Mr. F. S. Kenyon, Mr. Charles Martin, Mr. S. W. Thompson, Mr. R. Walker, jun., R.E.; Major F. Seymour Leslie, R.E., A.S.E.A. (vice-president), Mr. Silvanus Trevail (vice-president), Mr. Ellis Marsland (hon. secretary), Mr. H. G. Quartermain (hon. treasurer), Rev. A. Mercer, Rev. C. A. Berry, Mr. C. A. Bassett-Smith, Mr. G. H. Phillott, Mr. J. R. Manning, Mr. G. E. Bond, &c. The toast of "The Queen" having been given by the President, Alderman Sir David Evans proposed that of "The Houses of Parliament" coupled with the names of the Earl of Jersey and Mr. Ernest Flower, M.P., who responded, Lord Jersey alluding to the Government Buildings Act just passed as providing the way for an important Metropolitan improvement which would, it was hoped, afford a good architectural approach from Charing-cross to Westminster. The President gave the toast of "The Clergy," remarking that they had ever been among the best patrons of architects. The toast was acknowledged by the Rev. A. Mercer, who remarked that he officiated in a church designed by a member of that society, in which the acoustic properties and the means of ventilation were perfect; the Rev. Dean Vere also responded in a humorous anecdotal speech. The Hon. W. F. D. Smith, M.P., in proposing "The London County Council," referred to the fact that the President had from the first been a member of that body, and remarked that the Council had done much to improve and beautify London by clearing away insanitary areas and making new thoroughfares, and thus afforded new opportunities for the architectural profession. It had done an immense amount of useful and beneficial work. Lord Welby, in replying, said the County Council were constantly charged with being adventurous and extravagant; but it was, he claimed, essentially a modest and retiring body. They were compelled to carry on their business in an inadequate building in an obscure corner of St. James's Park. Once on a time they were inspired with ambition when they contemplated the palace in which the Houses of Parliament met, and even that wherein their colleagues on the London School Board worked; but when they put in a claim to be comfortably housed, their claim was contemptuously rejected by the House of Commons. He hoped that House would, in the not distant future, look upon their claims with a more lenient eye, and permit them to provide themselves a larger residence which should contribute something to the honour and dignity of London. Mr. L. Atherley-Jones, Q.C., M.P., proposed the toast of the evening, that of "The Society of Architects and Architecture." The society had not, he observed, as yet attained very mature years; it had only reached the interesting age of pupilage, being, he believed, in its fifteenth year. But it had an object in view, which was to raise, not the individual status of its members, because that was scarcely a necessary object to aim at; but it sought to raise the standard of architecture, and to secure greater benefits for the public at large. He regretted very much the difficulties that had hitherto stood in the way of the passage of an Architects' Registration Bill, of which he had had charge for some years past. The present imbecility of private members was to be deplored, and it was in the greater pressure of business impossible to secure the passing of any measure which met with the smallest opposition. He would advise the profession, in face of the many difficulties before them, to resort to the system of lobbying to secure the passing of the Bill. There was a feeling against monopolies, both public and quasi-public; but they saw that similar powers to those sought by the measure had been granted the solicitors, medical men, dentists, and even patent agents. The Legislature, in his opinion, had been strangely neglectful of the interests of the architectural profession. It ought to be made clear that by adopting registration great benefits would accrue, not only to the profession, but to the public. The President, in responding, said he fancied it was difficult to place the case of registration before the profession in a new light; but he emphatically denied that the members of the society desired to establish a monopoly by the passing of the Registration Bill. All they asked was that in the future those who proposed to enter the

profession should not do so without affording some guarantee that they could pass a properly-qualified examination. He was astonished at the apathy and opposition with which the introduction of so obvious a desideratum as the Architects' Registration Bill had been received; but perhaps one reason was that, until the society was established more than fourteen years ago, no body of architects raised the question. But since its formation the Registration Committee had earnestly endeavoured to call public attention to the need for this desirable reform. The public did not realise that at present anyone who could afford to buy a brass plate could call himself an architect, and could undertake the erection of a building without any training or knowledge whatever. It had been said that the artistic side of the profession would be injured by having to pass a qualifying examination: but an architect's artistic powers were no more liable to be injured by his being compelled to give evidence of a knowledge of construction and sanitation than the inventive qualities of a painter were lessened by his being taught anatomy. In no Continental country were architects placed in the same position as in England. He trusted they would soon be able to carry the Bill through. Mr. Ellis Marsland proposed "The Registration Bill Committee." In a few terse sentences he sketched the history of the registration movement, remarking that the committee was formed in 1886, and that its policy had been a three-fold one of watching, working, and waiting. The Society of Architects had taken a very active interest in the movement, which was gaining ground, especially in the provinces, largely as the outcome of meetings held at Cardiff, Bristol, Leeds, and Newcastle. The committee had met with some opposition; but no arguments had been advanced against the proposal, and the greatest difficulty was the apathy of members of their own profession. Mr. Robert Walker, of Cork, past-president, responded for the committee in an able and eloquent speech. The remaining toasts were "The Visitors," proposed by Mr. Trevail, of Truro, and responded to by Judge Emden; and "The Press," proposed by Major Leslie, and acknowledged by the representative of the Building News.

THE ARCHITECTURAL ASSOCIATION.

THE ordinary fortnightly meeting of the Association was held on Friday evening at 9, Conduit-street, W., the President, Mr. Hampden W. Pratt, F.R.I.B.A., in the chair. Two nominations were read, two former members, Mr. F. W. Macey and Mr. H. H. Smale, were reinstated, and, on the motion of Mr. G. B. Carvill, hon. sec., a vote of thanks was passed to Mr. F. B. Wade for permitting members to visit Lord Windsor's house on March 26th, and to Messrs. Spalding and Cross and Mr. H. T. Hare for permitting members to visit the Shoreditch Public Baths and Free Library on April 2nd, and to Mr. J. E. Wakeling, J.P., for conducting the party over the baths. Mr. E. Howley Sim, hon. sec., reminded members of the concert to be held on the following Friday (to-night) at the Café Monico, Piccadilly-circus. The President announced that the following classes were about to commence:—Mr. Weedon's Water-Colour Class on Saturday, May 7, 2.30 p.m., at 56, Great Marlborough-street; Mr. A. O. Collard's class on "Professional Practice" on Monday, May 2nd, at 6.30 p.m., also at 56, Great Marlborough-street; and the Sketching and Measuring Class would hold its first meeting at South Kensington Museum on Tuesday, May 3rd, at 6 p.m. The next spring visit, Mr. Carvill stated, would take place at 3 p.m. on Saturday, May 7, at the new Crown Theatre, High-street, Peckham, by permission of the architect, Mr. Ernest Runtz. Some donations to the library were acknowledged, with thanks.

THE HOUSE LIST

of nominations for officers and council for the ensuing session was read by the President, that of the suggested President Mr. G. F. Fellowes-Prynne, and vice-presidents, Messrs. P. J. Marvin and A. S. Flower, F.S.A., being received with applause. It was explained that any two members might, if they desired, nominate others willing to serve at the next meeting to be held on May 6; but the assent of the gentlemen nominated must be obtained.

THE MORALITY AND ECONOMY OF COMPETITIONS.

The following paper on this subject was read by Mr. H. B. Cresswell:—Some two years ago I had the honour to contribute to Architectural Association *Notes* a series of articles in which the subject of architectural competitions was lightly touched upon. Certain figures relating to the number, value, and dimensions of public competitions were assumed as fairly approximating to the real ones, and it became manifest that the competition system, when viewed from the basis afforded by these figures, was irrational in the extreme. In spite of the popularity of competitions, it seemed that the whole fabric of them constituted for the profession an inconceivable folly, and accordingly the results and conclusions ensuing from these assumed figures appeared incredible; but as these figures were certainly within the limit of fair supposition and probability, it struck me that if the actual statistics could be obtained and exhibited in their true significance, our competition system could be demonstrated to be at once futile and disastrous, both to the interest of the profession and to the art of architecture, and the system accordingly fall to utter disrepute. One was quite unaware that as early as 1838 a special committee of the Institute had investigated the matter in detail; and that 20 years ago the same idea had urged the late Mr. Thomas Porter, a Fellow of the Royal Institute of British Architects, to proceed upon the same lines that had been laid down for this paper. I found I had elaborately taken my apple-cart to an orchard where the trees were already stripped. Mr. Porter made an exhaustive investigation of the facts and figures relating to competitions, and clearly demonstrated and established the

FUTILE AND DISASTROUS

character of the system; but, so far from his revelations bringing competitions into disrepute, they would seem to have stimulated the promoters to new and more extravagant irregularities, and the competitors to a keener rivalry. One duly discovered the existence of Mr. Porter's elaborate tables only when one had gone far towards completing just such a series of tables oneself, which was to a certain extent unfortunate, because Mr. Porter's figures are most carefully verified and completely established, and prove those points which they deal with, and a great deal of one's own investigation must therefore seem largely superfluous. After what has been said, it would be well to recapitulate the

HISTORY OF THE VARIOUS PROTESTS AND OBJECTIONS

that have been raised against the competition system in this country. Organised and systemised protests against the system date from quite early in this century; and, for the better part of a hundred years at least, the voices of ingenuous architects, defrauded in open competition, have been heard in choruses of lament, mutually, at the tyranny of rural shopkeepers, and combining to make public protest and demonstration just as they are to-day. I have noted the following instances and occasions; but no doubt there were others which have not fallen under my notice. In 1838 a committee was appointed by the Institute to consider this subject of competitions, who, having thoroughly investigated it, seemed appalled by its difficulties, and concluded by publishing a report containing much "valuable information, but leaving the remedy very much as it was before in the hands of the profession." In 1850 the Architectural Association considered the question, and drew up a report containing a code of regulations, which it was suggested would meet the difficulties of the case. In 1857 Mr. George Morgan read a paper before the Institute upon this subject, which led to a debate, in which everyone agreed again that something ought to be done. In or about 1860 the "Architectural Alliance" took steps to draw up a form or circular suggesting terms of "general conditions," which were sent to such committees and councils as showed symptoms of breaking out into competitions. In 1871, on the occasion of the General Congress of Architects, Professor Kerr read a valuable paper on the subject of the commercial aspects of competitions. Everyone agreed that something ought to be done. A special committee was again nominated and deputed by the Congress to investigate the matter and report accordingly. In 1872 this report, together with a code of proposed regulations for the conduct of competitions, was read before the Congress of that year, and the Congress were, with one exception, unanimous in agreeing that something ought to be done. The exception was Sir Edmund Beckett, who made a very able and interesting speech in the character, as architects may consider, of devil's (or grocer's) advocate. They are the recommendations of this same report, revised again in 1883, which to-day stand in the back part of the Institute *Kalendar* as "Suggestions for the Conduct of Architectural Competitions." In 1879 Mr. Thomas Porter read his exhaustive paper on the subject, in which the best that has been said in demonstrating the suicidal folly of the profession in acquiescing in the competition system is there printed and set down. After hearing that paper, everybody was as completely satisfied as they had ever been that something ought to be done. It was a past president of the Architectural Association, Mr. Cole A. Adams, who the next year did—or very nearly did—the necessary "something" by drawing up and circulating a

MEMORIAL,

which was signed by 1,300 architects, who thereby bound themselves to take part in no competition save where a "professional adjudicator of established reputation was employed." This was presented to the Institute by the late George Edmund Street in 1881, when the subject was again discussed. It is indeed a cause for regret that the activity aroused by Mr. Porter's laborious investigations, and organised by Mr. Adams's energies, should have been allowed to burn itself out without profit to anyone, because it was the occasion of a revelation of such importance and significance as is not likely to occur again, and the fact of this enterprise having failed to any substantial purpose, sets the profession in a much more hopeless position than if the endeavour had never been made. While, however, the Special Committee of 1872 found that professional assessors were rarely employed, I find that in the present day more than half the competitions avail themselves of the services of such an assessor. There is no reason to suppose that this is not a direct result of Mr. Adams's memorial. Nevertheless, when such a momentous occasion has wrought such a small benefit, how can we hope other men to interest themselves actively in a reconstruction of the system? Still, as far as one is able to judge, the Institute, and indeed the profession in general, is as firmly convinced as it was in 1838 that something ought to be done, which is a matter for congratulation. The subject came up again when in 1883 a special committee of the Institute was appointed to revise the regulations for conditions of competitions drawn up in 1872; but I am not aware that it has found any prominent or special attention in the fifteen years intervening, so that there seems some reason for the conclusion that the failure of Mr. Porter and Mr. Adams in 1881 has unfortunately tended to relegate the subject to the great limbo of the hopeless causes. But there is hope. We have seen that in 1838 the Institute debated this subject, in 1858, in 1871, and 1872; and in 1881 and 1883 it held debates and read papers on the same subject, and if, therefore, things continue in the world of competitions as they have been doing for the past few years, it seems a reasonable ambition to hope and expect that the Institute will shortly read another paper to itself on the same subject, over again, and draw up some fresh reports and some more suggestions. Of the figures which are here presented for the first time, they have been modified from what was originally hoped and intended of them. It was found impossible to discover the actual number and value of all competitions in Great Britain over such a period as should afford an unquestionable average figure of competitions in any one year, because a large proportion of competitions are only advertised locally. In England alone, more than half of all competitions are not advertised or noticed in the professional journals, and both in Ireland and in Scotland the tendency is to preserve and confine competitions to their respective countries, a circumstance for which, under existing conditions, we can scarcely be sufficiently thankful. One is inclined to predict that, if these two countries opened their doors, and our voracity for competitions did not flinch from the new undertaking, the profession would fall limb from limb and rot away. The figures and facts hereinafter dealt with, therefore, must be regarded as having reference to England

THE AVERAGE ENGLISH PUBLIC COMPETITION.

Computed from the basis of seventy-one English Public Competitions advertised in the years 1894-5*; and from an analysis of thirty-four "conditions of competition" (see other table).

Value.	Premiums.	Competitors.	Promise of Assessor.	Premiums to merge in commission.	Promoters "not bound" to accept "1st award."	Promoters "not bound" to accept "1st or any award."	All Premiated Designs Property of Promoters.	The 5 per cent. commission to include extraordinary expenses.	Assessor's award admitted to be absolute.
£9,000	1st £53, other prizes to value of £52.	40	Over 50 per cent.	54 per cent.	54 per cent.	35 per cent.	73 per cent.	16 per cent.	Practically never.

* It is not meant that each item has been worked out from seventy-one cases. Full particulars of every case were not to be obtained, but the number of cases yielding each figure was sufficient to guarantee accuracy for round numbers.

six, but that his design should, under the conditions of competition (for the luxury of which they had staked £5 each), have been disqualified. This memorial was sent individually to each member of the council, shortly before the meeting which was to make the final irrevocable decision, with the intention, we may presume, of sapping their native resolution with such a show of firmness. Our powers of objection now became almost inspired, and certainly beyond human precedent. Two of the competitors, solemnly appointed and deputed by vote of them all, went and took residence in a hotel close by the building in which the council were to meet. Think of it! Two live competitors at hand, in a hotel, in person, to bring shame to the naughty councillors! Notification that these two protesting professionals were actually *in situ* at the hotel was duly sent to the council. One regrets to say that there is no evidence of the council having winced in bulk at this ominous news. We can fancy the pallor-stricken subordinate official bursting upon the elect councillors of Durham with the extraordinary intelligence. One has tried to realise the terrorising effect, or the persuasive influence of a brace of protesting architects in a hotel, inviting there inspection and examination from the townspeople. One has altogether failed. One can hardly picture anything funnier. Our profession is content to go out to battle with a glass tube and a mouthful of rice, instead of having recourse to the solicitor's letter, which is usually employed. The result of this venture was that the council said that they claimed legal right on the conditions of competition, and, further, that the disqualifying features in their awarded design had not been brought under their notice, while a noble Lord who had got washed up on to the council in the late high tide of municipal aristocracy, denounced the protesting brothers' cause as "a professional squabble." What else than something of this kind we could have expected to get from the council it is not very easy to imagine. The protesting brothers seem to have appealed to the council's sense of justness, to its goodness of heart, and so forth; which, in face of the printed regulations accepted open-eyed by each competitor, was quite beside the mark, and an affront to both the understanding and the feelings of the council. Apparently the deputation of protest expected to be answered somewhat as follows: "Gentlemen, we have been touched by your appeal to our good nature and sense of poetic justice, and though we were careful in the 'conditions' to secure a free right to appoint whoever we might choose, yet your eloquence has shown us so clearly how base and shameful our motives were, that we herewith withdraw our decision, and agree to do what you wish." Unfortunately, side by side with our champion objectors' words of appeal, was the complacent admission of the assessor, who told the council that "of course they were not bound by his award." And now, gentlemen, bearing this scene in mind, is architecture a professsion or an art?

A GREAT NUMBER OF SUGGESTIONS

have been made for the amelioration of reorganisation and reconstruction of competition, but, so far as I know, no one has suggested that we should, in the matter of competitions, individually regard architecture either as being a profession or an art, or both, and that we should return to that attitude of independence with which it is hoped most of us left school or college, and which was ours before we were enticed to the attitude of the emulative haberdasher soliciting someone's valued order. We are wont to deal with matters relating to a private commission from a quite different standpoint to that from which we regard competitions; but I think few of us will deny that the wide generality of local competitions has spoiled our clients; and I think you will agree that the ordinary man who has not the advantage of a private fortune or a circle of the right sort of friends is almost compelled to submit to the humiliating treatment from his prospective clients. For my own part I feel strongly against turning the profession into a sort of trades' union, yet most of the remedies which are suggested imply that or tend to that end. The matter lies in our own hands. Our disordered competition system is a monument to our incontinent unthinking greed and folly. We have over-reached ourselves, and we must retract and amend, and bring matters back to a condition of ordered decency.

ANALYSIS OF THIRTY-FOUR CONDITIONS OF PUBLIC COMPETITION, AS ISSUED TO COMPETITORS, TAKEN AS THEY CAME TO HAND FROM THE PORTFOLIO AT THE LIBRARY OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

Limited or Public.	Value.	Premiums.	Assessors?	Premium to Merge in Commission.	First Award to Execute.	Drawings Property of Committee.	Assessors Absolute.

THE POWER LIES CHIEFLY WITH ASSESSORS,

because they are few, and because they are men of substance and position. It should surely be with them a *sine quâ non* for their sanction of conditions of competition that the terminology is legal and free of ambiguity, and that the various clauses are fair and reasonable. There is a very strong general disinclination to enter a competition where an assessor is not employed. Let it be noticed and understood in the profession that the assessor is a guarantee, that the conditions is a legal document, and that the clauses are fair and reasonable in the circumstance (which at present is far from being the case, as we have seen), and it will soon be difficult to get anyone to enter a competition where this guarantee is wanting. This may not do much to ameliorate the radical false basis of the system, but it will mitigate its corruptions and irregularities, and it will enable these affairs to be enacted with such decorum as befits an occupation which is only uncertain whether it is a profession or an art.

Mr. Aston Webb, in proposing a vote of thanks, remarked that Mr. H. O. Cresswell and Mr. H. B. Cresswell had been pupils in his office; he had had the pleasure of hearing the former gentleman's inaugural address as President of that association, and now had heard the brilliant paper of the latter given that evening. He could not agree with all his conclusions, and he was afraid, indeed, Mr. Cresswell left the subject very much where it was before—namely, that "something" ought to be done to improve the conditions of competitors. He had, indeed, listened very attentively to his eloquent peroration, but did not arrive at any definite conclusions. He knew the late Mr. Porter very well indeed, and remembered that Mr. Porter very often entered into competitions himself, although he held, as they had heard, strong views as to the morality of the competitors. They knew the old saying that there were such things as lies, big lies, and statistics, and he thought it would be impossible to check the statistics that had been adduced, or to test the sums really spent on competitions, but he should say that the average outlay was greatly overstated. The cost to the profession, as a whole, of competition work was undoubtedly grievous and heavy, but what were they going to do to lessen it? The memorial presented in 1881 by Mr. Cole Adams had a definite object in view, viz., to insure that in every competition an assessor should be appointed, the aim being to substitute the judgment of a highly cultivated man for what the lecturer had styled the crass ignorance of a body of grocer-men. The result of that memorial was that the advantage of having an assessor was generally recognised by those instituting a competition. Personally, he thought that architects should pledge themselves not to enter into a competition where no assessor was appointed, and should decline to compete if they were not satisfied with the assessor named in the conditions, and make their objections before, and not after, the award was made. The more particular architects were the fewer competitions there would be, and the more satisfactory would be the conditions. Young architects could not be too careful in ascertaining that an assessor had been appointed, and that the conditions had been fairly drawn up before entering on a competition; but it should be borne in mind that committees generally erred not through lack of a desire for fairness, but from absolute lack of knowledge. He was not there to defend

the system of competitions: he recognised the moral harm it had done to many men, but looking at it broadly he could not admit that it was altogether bad. It gave an incentive to exert their powers to young men, and it must be remembered that a great many men did their best work before they were 50 years of age. He would ask members to consider dispassionately what the effect of competitions had had on the development of our architecture, on architects themselves, and on the public. A system which had evolved such buildings as the Houses of Parliament and St. George's Hall, Liverpool, could not be said to have done badly; and while it would be invidious to mention more modern buildings, many of these had done much to advance the public taste. The planning and arrangement of public buildings had also been greatly improved under the stimulus of competition. As to the influence on competitors themselves, it certainly should be admitted that to encourage the gambling spirit in young men was to do them harm. As to the pecuniary loss involved, Mr. Cresswell's figures should be discounted by the recollection that a young man starting in practice had necessarily much time on his hands, and that this ought not to be reckoned in golden guineas. In recent competitions the tendency had been to reduce the labour and cost of preparing competitive designs, and if a competent assessor was appointed, the outlay in both directions could often be still further kept down. He must say that he never heard of a case in which the competitor's assistants and clerks were offered twice or three times the ordinary salary if their employer won, and he did not think such a practice existed. Coming now to his third point, the effect of competitions on the public, it would, indeed, be deplorable if private work for domestic buildings were put out to competition; but they nearly always arose where committees were concerned, each member of which would have wished to recommend a nephew, son, or friend for the job, and thus it was fairest to pit these against one another. Again, in a small town, it was not probable that a committee would obtain a better design if any other method of selecting an architect were adopted. As all architects asked the same price for their labour—5 per cent. on the outlay—it was doubtful how an untried man would get his first commission except in open competitions, since promoters could go to the most highly qualified and experienced man and pay no more for his advice. It certainly afforded a great pleasure to a young architect to give his imagination and powers of planning free scope in striving to solve some architectural problem in rivalry with others. There were signs that the competitions system was dying out, and this afforded an opportunity to secure fair terms for competitors in those still instituted.

Mr. E. W. Mountford said the ground covered by the paper was so extensive that it was impossible to deal with all the points raised by Mr. Cresswell. He had, undoubtedly, overstated the cost of competition work to the younger men, and also the harm which architects, when young, sustained by going in for competitions. The time of a young architect was not so fully employed as he could wish. He would say, if a man could get enough work to employ himself without competitions he should let them alone; but the work offered to most young men when beginning practice was of a very small kind, and it was an intellectual treat to work out the scheme for a large building, even if it was probable it would not lead to a commission, and the competitor was compelled to think out and ascertain many points which otherwise he would not learn until an actual commission was in hand. If architects would compete under obviously unfair or absurd conditions, they must take the consequences. He himself was recently invited to compete for a building to cost £1,100, and, though he declined, others entered. A great deal lay with the assessor: he should be a man who had had considerable experience in the particular class of work in which the competition was being held. As a rule, assessors were thoroughly up to their work, and acted to the best of their ability. It would be well if the assessor's name was published when the competition was instituted. There were two costly classes of buildings which were not produced by competition—theatres and publichouses, and yet their architectural character was as unsatisfactory as any that could be named. He believed that the man selected by the average committee-man would be a worse architect than the one who gained in competition, so that the system could not be entirely evil. Under it they obtained better buildings, and young architects had more opportunities for doing good work than would be the case if the competition system were abandoned. He would second the vote of thanks to Mr. Cresswell.

Mr. F. T. W. Goldsmith said the whole effect of competitions for good or evil depended on the attitude of the assessor. The "grocer-man" on a committee was to be pitied rather than blamed, for all his mistakes were due to the fact that he undertook to accomplish something which he did not understand. The matter was quite beyond his comprehension and that of his fellow-committeemen, and the clerk who drew up the conditions was supremely ignorant of the whole matter. If the Institute Council or the Association Committee could be brought into touch with promoters before they made the conditions public, some help might be afforded them, and good results would follow both to the profession and the public. For provincial works a committee of allied architectural societies might be empowered to take notice of any impending competition before the grocer-men had finally settled their scheme. They would all be obliged to Mr. Cresswell if he could discover and explain some method by which a representative body could get hold of promoters at an early stage. Competition would then be robbed of much of its evil. A system was now in vogue under which a series of suggestions were sent out by a R.I.B.A. committee to the promoters of all competitions advertised in the professional press, but it was obvious that when the conditions were published they could not be altered except by the assessor. In the case of one very important recent competition, it was announced that an assessor "may" be appointed. The ambiguity of this phrase was pointed out to the promoters, who substituted "will" for the objectionable word "may." Further, the promoters should be requested to publish the name of the assessor. He was sorry to see that architects of repute who had actually signed the Competitions Memorial had consented to act as assessors in cases where the conditions were not fair. Pressure had been brought to bear on the assessors in such cases, and they should be asked to give a guarantee not to act unless the conditions of the R.I.B.A. were adhered to.

Mr. Beresford Pite said he feared that Mr. Creswell stood no more chance of success in warning the younger members of the profession off entering on competitions than if he had warned them against entering on matrimony. The fact was, the very uncertainty of success, the gambling spirit, made young architects eager in the pursuit of this phantom. The competition system was not only delightful, but eminently useful to the younger men, and therefore they might expect it still to be popular. It cultivated the faculty of design—the very thing the architectural student needed. Unless he practised himself in designing, a young architect would never be an expert, and the very best practice for a young man was to study the conditions of competition for some one class of building, and to work at the problem again and again, until, by continued and repeated thought and effort, he was able to evolve a satisfactory design. Since the presentation of the memorial initiated by Messrs. Cole Adams and Aston Webb as hon. secretaries to the Competitions Committee, in more than half the competitions announced an assessor had been appointed. Before the date of this well-known memorial most of the competitions were for churches or schools, and it must unfortunately be admitted by all qualified to judge that the parson made a far worse assessor or member of a committee than did lever the ill-cultured grocer-man. The exhibition of the competitive designs should be insisted upon, and the fallacious character of a first premium which merged into the commission should be pointed out to the promoters. It would be very objectionable if a race of "guinea-pig assessors" should arise. It would be impracticable to abolish competitions, for everything was thereby cheapened, and although architects had retained their five per cent. commission, they had in many cases to fight for it in crowds. One great advantage in competitions which had not been alluded to, was that it demonstrated the men who were duffers and those who had ability, and it certainly quickened life in an architect's office to go in for competitions.

Mr. C. H. Brodie supported the views expressed by Mr. Cresswell. An architect would derive all the advantages to be gained from a competition if he prepared the drawings and did not send them in. By sending them in he degraded his profession—an assertion received with laughter and derisive applause. The conclusion of the paper was to ask the young architect not to go in for competitions; but this was perfectly futile and unattainable, for the gambling spirit which led him to enter on such undertakings would never be eradicated. He concluded by quoting three glaring cases of injustice and immorality in as many hospital competitions.

Mr. G. H. Fellowes-Prynne said they had had that evening two extreme views of the subject brought before them; the two most successful competing architects of the day, Messrs. Aston Webb and Mountford, had entered the lists against Messrs. Cresswell and Brodie. He thought the suggestion by Mr. Cresswell, that the assessor should ascertain that the rules were fair was a very good one. He hoped that some good would result from this paper, and that the Institute Committee would see its way to doing more to secure fair-play. Competition existed in all arts and trades, and while it might have its evils, architects must be willing to put up with them, only insisting that experienced men were appointed as assessors.

The President, in putting the vote of thanks, which was carried by acclamation, remarked that the discussion had grouped itself around the question of the assessor, and he was glad to hear Mr. Mountford say that in recent years there had been no reason for complaint against the adjudicators, although this had not been his own impression. [Mr. Mountford: There has been no ground for complaint as to their honesty.] The demand that the name of the assessor should be published from the first was, he thought, straining a point. It was a decided disadvantage in some ways, for some competitors had set themselves to imitate the style and treatment adopted by the assessor. The idea that the competitors should elect the assessor was a radical reform, and would probably be satisfactory to the competing architects if not to the committee. It had even been suggested that competitors should act as their own assessors; but there were obvious difficulties in the way, especially in a provincial competition. As to the cost of competitions, he thought this had been much exaggerated, and for the outlay competitors themselves were largely to blame for their endeavours to put as much work as possible into drawings. The amount of work required should be cut down in the conditions. Something had been done in the last thirty years to improve the conditions of competitors, but they were not yet perfect.

Mr. Creswell, in his reply, said there had undoubtedly been a great improvement of late years in competitions; in 1872 the appointment of an assessor was a very rare occurrence. He did not think it added to the dignity of the profession to bring it into line with the actions of glorified tradesmen. An excellent suggestion had been made that competitors should adjudicate on their own plans and should each have two votes—one of these every man would, as a matter of course, bestow on his own design, and the second he would give to that of his best friend.

THE R.I.B.A. COUNCIL REPORT.

THE Report of the Council of the Royal Institute of British Architects for the Official Year 1897-98, to be submitted to the annual meeting next Monday evening, states that in the course of the year 8 Fellows have been elected, 31 Associates, 3 Hon. Associates, and 9 Hon. Corr. Members. The number in each class stands as follows:—Fellows, 598; Associates, 1,001; Hon. Associates, 53. The following gentlemen have been elected as Honorary Corresponding Members:—MM. Jean Jacques Winders (Antwerp), Alexandre Charles Arthur, Comte de Marsy (Compiègne, France), Jean Théophile Homolle (Paris), El Conde de San Januario (Madrid), Johan Louis Ussing (Copenhagen), Settimio Fedele Gerardo Giampietri (Rome), Arnaldo Rodondo Adaes Bermudes (Lisbon), Leopold Eidlitz (New York), Valère Dumortier (Brussels). The losses by death to the Institute during the past year have been numerous and serious. They are as follows:—Fellows: Arthur Baker, Daniel Birkett, W. Steven Cross, James Edmeston, Octavius Hansard, John L. Pearson, R.A., C. J. Phipps, C. J. Shoppee. Associates: Joseph Battye, C. A. Chastel de Boinville, A. J.

Forge, C. J. Gladman, George Kenyon, George H. Stone Wood. Hon. Associates: Sir Henry Orrell Bessemer, F.R.S., the Hon. Charles Alexander Gore, Alfred Morrison. Retired Fellow: George Elkington. In John Loughborough Pearson, R.A. (Royal Gold Medallist, 1880), the council mourn the less of one of the most distinguished members of the Institute. Octavius Hansard was for many years a member of the Council, well known to most of the older members of the Institute; and James Edmeston for a number of years was chairman of the Architectural Union Company.

Preliminary and intermediate examinations were held in June and November, 1897, in London, Manchester, Bristol, and final examinations in London. During the year 170 gentlemen have been registered as probationers, the number of whom now stand at 983; and 69 have been registered as students, the number of whom now stands at 248. The Arthur Cates Prizes for the best set of testimonies of study submitted by students for admission to the final examination have been awarded to Mr. Percy Morris [A.] for the June examination, and to Mr. Laurence Hobson [A.] for the November examination. The Ashpitel Prize has not been awarded this year. The Board of Examiners, after numerous meetings and anxious consideration, have prepared a new syllabus of the examinations. The new regulations will come into force during the June examinations. With regard to the Owen Jones Studentship, the Council report that, the value of the Studentship having gradually increased to double its former value, and the will of the late Owen Jones giving them the authority to act, they have increased the value of the Studentship from £50 to £100, and the duration of the student's tour from eight weeks to six months. They have also decided that, on his return from the tour, the student shall submit an original composition in colour decoration on a prescribed subject. The Council announce that they have taken over from the Architectural Union Company the lease of the second floor of the premises in 9, Conduit-street, at the rent of £175 per annum, the lease to be coterminous with that of the premises already occupied by the Institute. Two rooms are sublet. Of the remaining three rooms, one will be used, for the present, as an office; another has been fitted with bookcases, to afford storage space for the library, which has outgrown its present accommodation; while the third room, to the front, overlooking Conduit-street, is being fitted up as a tea and smoking-room. The Council have invested since December 31 last £148 in shares in the Architectural Union Company, and £974 11s. 7d. in 2¾ per cent. Consols.

ARTISTIC COPYRIGHT: PATENT FOR PLANS.

MESSRS. FLOCKTON, GIBBS, AND FLOCKTON, of Sheffield, write in the *Institute Journal*:—In the discussion of the paper by M. Harmond on "Artistic Copyright" [reported in the Building News of the 8th inst., pp. 484-5], questions were asked the lecturer as to "whether he was aware that one firm of architects in the country did go so far as to patent one of their designs, and whether he had made any inquiries as to their care in taking out that patent, as to whether it was satisfactory to them, or whether it had any effect in any way upon other architects."

We believe we are the only firm in the country who have patented a design, and that probably, therefore, the questions refer to us: and the Institute having so lately discussed the subject, it may interest readers to hear our replies—viz.: We protected our design as a "plan," not as an "artistic design," and that it has not yet been directly infringed is due either to the care with which the patent was prepared, or to the worthlessness of the subject of it; that the latter is not the case we infer from the fact that nearly the whole of the municipal buildings since designed have partially adopted the separation of departments, that the separation of departments has been wholly adopted in a polytechnic institution, and the building in wings with a central hall and staircase has been adopted in a public hospital. In further reply, the patent has not been satisfactory to us, inasmuch as it has not benefited us, and has, we believe, deterred other architects from adopting the plan in its entirety.

Remembering that at the time of taking out the patent we were recommended by the Council of the Institute not to do so, but to follow the honourable tradition of the medical profession, we are pleased to find that the kindred subject of "Artistic Copyright" has been thought of sufficient importance to be the subject of a paper read before the Institute.

LATER RENAISSANCE ARCHITECTURE IN ENGLAND.*

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THE Gothic Revival, at any rate in a general sense, has become a thing of the past; the "Queen Anne" style, so-called, is dead; the ornate confectionery of the resuscitated Renaissance is wearing itself out with attenuated detail, while fashion is turning towards a Later type of work. This movement probably will be aided by the determination of the First Commissioner of Works, who has decided that the new Government buildings in Parliament-street shall be designed in a Classic style. The choice of an architect mainly, in fact, turns upon the conditions thus insisted on. He must be familiar with the principles, not so much it would seem of pure Classic architecture, but of the application of Classic forms as seen in buildings erected subsequently to the Elizabethan period. Moreover he must, to obtain the War Office commission, be able to shew by his executed works that he has put this knowledge into practice. We make no objection to the selection of a style, but everything must depend upon the choice of the architect. No matter what the style—indeed it would be wiser to say as little as possible about that—the success of the design depends wholly upon the individual selected to design it. No number of photographs and measured drawings of historic examples, no mere acquaintance with the various archæological phases of building in any given period, or, for that matter, of all periods, will compensate for the absence of a capacity to design, and a capability to carry through the general design in detail. Books and pictures of buildings are at best very limited in practical value, after all. Sketching, indeed, and measuring up fine examples, will not make an ordinary man into an architect in the true sense of the word. Nevertheless, in spite of all this, books are of the greatest use, and sketching or measuring must form the basis of an architect's knowledge. Photographs as records obviously remain unsurpassed in usefulness, and when the prints are permanent their utility is clearly enhanced, while, if the photographs illustrate the style in vogue, they become necessarily of consequence as patterns for the practitioner. Mr. Batsford aims, no doubt, primarily at a higher and more lasting character for his books; but the production of these folios in illustration of the Later Renaissance, under the joint editorship of Messrs. J. Belcher and Mervyn Macartney, may be considered timely and appropriate even in the transitory sense which we have ventured thus to indicate. For the profession no better recommendation could be mentioned, architects in business must be up to date, and most professionals desire to be *à la mode*. The issue, therefore, of the third part of the "Later Renaissance Architecture in England," to which we have to-day to direct attention, seems unusually opportune, and we may supplement these remarks by illustrating one of the plates from the folio in question, giving as a specimen the view of the Entrance to Clare College, Cambridge, an exceedingly happy example of 17th-century architecture, marked by a purity of grace in perfect keeping with the destination of the building, essentially modern in idea, and yet quite in good taste. The college was commenced in 1638; but the Civil War hindered the progress of the work, which was renewed after the Restoration, though not completed till 1715. The chapel, which is not a success, was finished in 1769, from the design of Sir James Burrough, then Master of Caius. St. Catherine's Hall, Cambridge, also illustrated in the part before us, was commenced in 1760; but its design retains the mullioned windows of Elizabethan, not to say Gothic character, in a like manner, to some of the windows in Clare College, thus producing a happy combination of features not really at variance, in themselves, and evolving, as a whole, a complete and characteristic English style.

Messrs. Belcher and Macartney have not hesitated to include in their book several minor 17th and 18th-century houses of ordinary type to be seen in the main streets of some of our older towns, as for instance, the shops and houses at Stamford, Hertford, and Warwick. A few of the more ambitious subjects gain much from their surroundings, and one of these is the mural fountain in the garden at Bowood, Wilts, where the detail is poor. Swatley Hall, Uxbridge, rather overcrowded with gables, is a handsome house, having, however, very ill-proportioned windows. The exquisite detail of Ashburnham House staircase from Westminster, is beautifully rendered, and Mr. Harry Sirr's carefully measured drawings of it much increase the value of the series. Coleshill, Berkshire; Thorpe Hall, Peterborough; Ball's Park, Hertford, and the brick-fronted house at Farnham, Surrey, serve to make the collection representative, though we should hardly admire their repetition in actual execution nowadays. The Earl of Burlington's villa at Chiswick, at present used as a private lunatic asylum, and the stone-built houses in Cavendish-square, are of a higher type of work entirely, while, of course, Greenwich Hospital Chapel, the Senate House, Cambridge, and Hampton Court Palace illustrate the choicest buildings of their periods, each, however, in its individual way. The staircase ceiling from Belton House, Grantham; the Pin Mill, Stroud; the staircase photographed at Eltham, and the measured gateways and portico from Groombridge Place, Kent, show how thoroughly the editors have worked to make their undertaking a success. The old Classic house, from the Close, Salisbury, is among the most suggestive in the folio, and its interior details are useful, too. The same may be equally well said of Mr. J. Jeass's drawings of the Senate House, Cambridge, or of Mr. H. P. G. Maule's measured elevations of Hampton Court Palace river front. Mr. Batsford spares neither pains nor enterprise in producing a work worthy of the occasion.

CHIPS.

The Midland Railway Company have decided to abandon the clauses of their Bill enabling them to construct a line from Thornhill to Huddersfield and thence to Halifax.

The urban district council of Hove have received sanction from the Local Government Board for the borrowing of £6,500 for works of street improvement. The work is to be done in three sections; £2,000 is to be spent at once.

A large house ("Hazelbank") in the Scores, St. Andrew's, N.B., built for Mr. G. Coutts Douglas, J.P., from plans by Mr. John Milne, is nearing completion. The contractors are:—Mason work, A. and J. Carstairs: joiner, Andrew Cunningham; plasterer, Andrew Scott; painters, M'Gregor and Son; electric fittings, A. Westwood and Son, Dundee.

At Clutton, near Bristol, a curious stained-glass window has been recently inserted in the parish church in memory of the Rev. Albert Boudier, who for eighteen years was rector of the parish. The window represents St. Dominic, the founder of the famous preaching order, in his black and white robes, and St. Basil in the dress of a Greek bishop. The reason for the selection of subjects is that Mr. Boudier was born on St. Dominic's Day, 1823, and died on St. Basil's Day, 1897.

Mr. J. R. Findlay, of Abelour, has further enriched the National Gallery of Scotland by adding to its collection the picture "La Gloria," by the late John Philip, R.A. To Mr. Findlay was due the foundation of the Scottish National Portrait Gallery, he having offered the sum of £10,000, in addition to the cost of the building, towards its establishment, providing a like sum was forthcoming from the Treasury. His offer was accepted and the gallery commenced. He has now given a further £10,000 towards the external and internal decorations. It is announced that Mr. W. Hole, R.S.A., is to have charge of the decoration of the central hall and ambulatory.

Cromford Church, on the banks of the river Derwent, has, during the past year, been undergoing internal alterations. The chancel before the alterations was cut off from the nave by the projecting ribs of the arch, making the church consist almost of two buildings. A new arch has been built, springing from the north and south walls, and the chancel filled with oak stalls. The west end has received new windows. This work has been carried out by Messrs. Naylor and Son, of Derby. The plaster walls of chancel and nave have been decorated by Mr. Alfred O. Hemming, that in the chancel illustrating the early life of Christ.

OBITUARY.

We record with regret the death of Mr. Walter Sedgham Witherington, F.R.I.B.A., of Great Tower-street, E.C., after an illness of seven weeks, on April 18, at his residence, Aberdeen-road, Highbury Grange, N., at the age of 56. He was interred at Highgate Cemetery on Thursday in last week. The deceased was the son of Mr. Thomas Witherington, chemist, of Worcester, and he served his articles with the late Mr. Henry Day, of that city. He came to the Metropolis 30 years since, and soon commenced to work on his own account. His practice was a considerable one in the City of London, where he built a large number of offices and warehouses, hotels and licensed houses. Several undertakings associated with the improvement of business premises in London were due to his enterprise and skill as a practical architect. Mr. Witherington had a large connection in arbitrations, and in determining disputes his knowledge and integrity were highly valued and relied on. He was elected a Fellow of the Royal Institute of British Architects in 1881.

Mr. William Kettlewell, of Leeds, died on Wednesday week at his residence in Chapeltown-road in that city, aged 67. He was the son of the late William Kettlewell, founder of a firm of furnishers and decorators in Park-row, Leeds, and succeeded his father in its management. A year since he retired, and was in turn succeeded by his son. Only on the Friday preceding his death the workpeople presented Mr. Kettlewell with his portrait painted in oils by Mr. Percy M. Teesdale, to mark the completion of his 50 years of business life. For a lengthened period Mr. Kettlewell took an active interest in the affairs of the city. From 1883 to 1890 he was a member of the City Council, and during that period was chairman of the lamp committee and deputy-chairman of the streets and sewerage committee. He was the president of the West Riding Association for the Protection of Trade, and also held the office of treasurer of the Associated Trade Protection Societies of Great Britain.

CHIPS.

The Forest Brickworks at Tunbridge Wells were formally opened by the Marquis of Abergavenny on Thursday in last week. The undertaking has been started by Mr. W. Barnsley Hughes, a local architect, and covers an area of 20 acres. The works have been planned by Mr. E. P. Lee, of the Cardiff Brickworks, and the machinery has been supplied by Messrs. John Whitehead and Co., of Preston.

A stained-glass window is about to be placed in the Hollness Memorial Church at Wishaw. The work has been intrusted to the firm of Stephen Adam and Son, Bath-street, Glasgow, who have already filled all the other windows in the church for the Houldsworth family. In the upper panels of the window Nehemiah is depicted as directing the rulers of Israel to repair the broken walls of Jerusalem, while in the lower division of the window is shown the servants of the Centurion entreating Christ to visit his sick servant.

A Primitive Methodist church and schools are being built at Leicester from plans prepared by Mr. Harper of Nottingham. The church will seat 600 persons on the ground area, and 400 in the galleries. The facings are of pressed brick with Hollington stone dressings, and the entire cost will be £3,500. Messrs. Langton and Son, of Enderby, are the contractors.

A Primitive Methodist chapel and schools are to be erected in Camp-street, Great Clowes-street, Lower Broughton, Manchester. The schools, the stone-laying ceremony in connection with which took place on Saturday afternoon, and the caretaker's house, are already in course of erection, at an estimated cost of £2,600.

The ninth annual exhibition of school drawings, held by the Royal Drawing Society of Great Britain and Ireland, was opened on Monday afternoon by the Hon. Lady White Ridley at 50, Queen Anne's-gate, S.W. Sir Wyke Bayliss, who presided, alluded to the growth of the society, and to the evidence of improvement on the part of the exhibitors which was shown by a comparison of the reproductions of previous years with the works of the same pupils this year. Mr. T. R. Ablett, the hon. director, said the age of exhibitors ranged from four to 20 years, and they were pupils in the great public schools, high schools, and grammar schools. Altogether about 170 schools were represented, some being in Scotland and Jersey, and one in Newfoundland. Lady Ridley, in declaring the exhibition open, expressed thorough approval of Mr. Ablett's system of teaching. The exhibition will remain open until Saturday in next week, May 7.

Building Intelligence.

Birmingham.—A new building is about to be erected to house the Birmingham Old Library at the corner of Margaret and Cornwall-streets. Messrs. John Barnsley and Sons are the contractors. The designs, by Messrs. Cossins, Peacock, and Bewlay, provide for a building of two stories, with an extra floor in the roof in the rear portion. The principal frontage, which will be in Margaret-street, will have a length of 81ft., while along Cornwall-street the library will extend 87ft. The architects have adopted the style of the English Renaissance. The Margaret-street front will be broken up into three sections, that at each end being gabled, while the middle section will be slightly recessed, this arrangement leaving a narrow area space for lighting the basement and breaking the line of the façade. The middle section will be divided into three bays by buttresses, surmounted by piers. In each bay on the ground floor will be a four-light mullioned window, with semi-circular head. In the upper story each bay will contain two rectangular two-light mullioned windows. The smaller of the gabled sections will contain two three-light mullioned windows, and the larger, that next the corner, a large five-light window on the first floor, with the principal entrance beneath. The Cornwall-street frontage will be treated in a similar way. Each of the projecting portions of the frontage will be faced up to the first floor with white Hollington stone. The remainder of each façade will be made up of bright-red Ruabon facing bricks, with bands of white Hollington stone, the latter also being used for the other ornamental features. The entrance portico and lobby will be faced with stone. Swing doors will give access to a hall, 23ft. by 27ft., in communication with the clerk's office and the librarian's room and a committee-room. Adjoining the hall will be the lending-library, a hall 54ft. by 35ft. This will contain adjustable shelving for 25,000 volumes. The shelving will be on iron frames, arranged in bays, and the floors here, as throughout the building, will be fireproof. The library will be laid with wood blocks, and the entrance hall with mosaic pavement. A stone staircase will lead to the upper floors. The principal room on the first floor will be the general reading-room, which will have a ceiling of segmental section divided into bays by the wooden roof principals. Adjoining the reading-room will be a small room for rare books, a smoking-room 32ft. by 23ft., and a lady proprietors' room. The second floor will be devoted entirely to the storage of books. The basement will contain the books not in current demand, a book-repairing room, an assistants' mess-room, the caretaker's rooms, the heating-chamber, and the coal-store. With the shelving placed on the walls of most of the rooms, the library, which at present owns 80,000 volumes, will have room for about 200,000.

Chester.—The memorial-stone of a Primitive Methodist chapel was laid in Hunter-street on April 20. The style adopted is a free treatment of the 15th-century English Gothic. Red Ruabon bricks are to be used in the facings, the finishing of the doors, windows, gables, and tower consisting of a golden buff terracotta. The constructive timber employed will be Baltic redwood, stained and varnished pitch-pine being selected for the internal joinery. Covering the building will be a roof of Welsh purple slates. Tinted rolled cathedral glass in lead-lights has been chosen for the windows. The tower will be utilised as a foul air extracter. The site of the building is 51ft. by 56ft., almost a square; the ground plan of the church portion is in the form of a Greek cross, the corners being devoted to entrances, vestries, &c. Ministers and stewards will be provided for on the ground floor, while two vesteries will be arranged on the gallery floor. The heating apparatus will be located in the basement. The total sitting accommodation is for 570, and the vestries afford accommodation for 56 more. The chapel was designed by Mr. Thos. Howdill and Mr. Chas. B. Howdill, A.R.I.B.A., of Leeds, while the whole of the building contract has been let to Mr. Wm. Vernon, of Chester.

Coniston.—The new institute was opened on Tuesday evening in last week by Mrs. Arthur Severn. The original roof now covers a reading-room, recreation-room smoke room, committee-room and small museum. The additions, which have cost over £2,000, comprise a caretaker's cottage, with refreshment-bar and a bathroom, and a large assembly-hall. The latter room will accommodate upwards of 500 persons. There are three ante-rooms in connection with it. The whole building, with the exception of the cottage, is heated by hot water. The plans were prepared by Mr. R. Walker, of Windermere. The contractors were:—Mr. George Usher for walling, Messrs. J. and J. Bell for joiners work, Messrs. Redhead for painting, plumbing, and glazing; Mr. H. B. Armstrong, Windermere, for plastering; and Messrs. Seward and Co., Lancaster, for heating.

Crewe.—The Earl of Crewe laid, last week, the foundation-stone of a new chancel, which is being added to Christ Church, Crewe. Mr. John Brooke, of Manchester, is the architect, and Mr. Matthews, of Nantwich, the builder. The complete scheme provides, in addition to a chancel, for a morning-chapel on the north side, and clergy and choir vestries and an organ-chamber on the south side, but the present contract includes only for the building of the chancel. Following the method so often found in connection with Mediæval churches, the new chancel is designed in a different style to that of the existing church, the style adopted being Perpendicular and treated with modern detail. The internal dimensions of the chancel will be 36ft. long by 20ft. wide. The east window will have five lights, the sill being raised high above the chancel floor. In each of the side walls there will also be windows of two lights forming a clerestory. On the north side there will be a double arcade, which will eventually open into the morning-chapel, also a credence in conjunction with a squint window from the future side-chapel. The present chancel arch will be replaced by an arch of more lofty proportions, and the roof of the new chancel will have hammer-beam principals, and a boarded and panelled ceiling. The walls will be of brick, with grenstall stone dressings to the windows, doorways, arches, and string-courses. The upper part of the inside walls will be finished in cement plaster with a granulated face, the lower parts of the walls being faced with specially-made Ruabon bricks. The roof will be covered with grey Westmoreland slates upon boarding and roofing felt. The floor of the chancel and sanctuary will be paved with tiles, excepting the space occupied by the choir-stalls, which will be paved with wood blocks.

The London Tramways Company appealed to the House of Lords on Monday to reconsider a previous decision as to the principle on which the County Council was to give compensation to tramway companies for the compulsory acquisition of their undertakings. The Lord Chancellor, however, said he adhered to the opinion expressed by eminent authorities in that House that a decision once given by the House on a point of law was conclusive ever afterwards, and it was impossible to raise the same question again. The other law Lords concurred, and the appeal was accordingly dismissed.

The new church of St. Edward, Birmingham, will be dedicated by the Bishop of Coventry to-morrow (Saturday). A year ago the buildings in New John-street West, on the west side of Summer-lane, consisting of a large chapel and schools, which had been occupied by the Presbyterian body, were bought and presented to the Church of England. Besides structural changes, an altar, pulpit, choir-stalls, organ, and vestries were required. The architectural work has been carried out under the direction of Mr. H. T. Buckland, who has transformed what was formerly a plain chapel into a well-fitted church.

A two-light window has been fixed at the east end of the south aisle of Christ Church, Ebbw Vale, Mon., the subjects treated being the "Resurrection" and "Our Lord as the Good Shepherd." The work was intrusted to Jones and Willis, of Birmingham and London

The ancient churchyard cross at Elmswell, Suffolk, has just been restored at the cost of Mrs. Luke, in memory of her late husband, Dr. Luke, sometime rector of the parish. The cross is over 17ft. high. The shrine contains a Calvary, and is surmounted by a floriated cross. The old base is a remarkable and beautifully ornamented piece of work, and the lower portion of the shaft was rescued by the present rector from the grounds of a house in the immediate neighbourhood.

The Lord Mayor and the Sheriffs will on Wednesday, June 1, pay a State visit to Margate, to formally open a piece of land, about 33 acres in extent, which Mr. John Woodward has recently presented to the town for the purpose of a public park and recreation ground, with the necessary approaches and roads.

Our Illustrations.

THE CROWN THEATRE, PECKHAM.

The building, of which Mr. Ernest Runtz is the architect, is now in course of erection in the Peckham-road, Camberwell, on a fine site. We have received no particulars of the undertaking beyond that which can be obtained from the accompanying illustration.

LATER RENAISSANCE ARCHITECTURE IN ENGLAND: ENTRANCE TO CLARE COLLEGE, CAMBRIDGE.

(See review on page 597.)

"THE HALL," GOODRICH COURT.

The hall forms part of large additions made to Goodrich Court a few years ago, for Mr. H. C. Moffatt. It is built of Hollington and Wilderness stones, with large buttresses. The roof is of oak, carefully selected by the owner from the neighbourhood and elsewhere; the scantlings are big, the principals being 26ft. long and 13in. by 10in., the collar and hammer beams 15in. by 10in., and the curved timbers under the hammer-beams are each in one piece. The whole is covered with lead, and there is a lantern on the ridge. The internal dimensions are 70ft. 6in. by 32ft. 6in., and the height 53ft. The organ is a fine instrument, by Willis. The builders are Messrs. Collins and Godfrey, of Tewkesbury; and the architects Messrs. H. A. Prothero and G. H. Phillott. The drawing is by Mr. H. W. Brewer.

COLNE TECHNICAL SCHOOL LIBRARY AND PUBLIC HALL.

This design was chosen last December, in an "open" competition, for the first place by Mr. S. W. Beaumont, F.R.I.B.A., Manchester, the assessor appointed by the corporation. The building will be simple in character and detail, stone faced, and is estimated to cost about £10,000. Messrs. Woodhouse and Willoughby, of Manchester, are the architects, the working drawings for which are now being prepared.

EASTLEIGH URBAN DISTRICT COUNCIL OFFICES.

This design was submitted in the recent competition by Messrs. Hall, Cooper, and Davis. Accommodation was provided for rate-collector's office, council clerk's public and private offices, surveyor's public and private offices, and plan-room and medical officer's offices on the ground floor. On the first floor are the council-chamber, committee-room, councillors' cloak-room, with lavatories, &c., adjoining, and caretaker's living apartments. The fire-station is planned in a quadrangle adjoining the main building along the Romsey-road, with stabling accommodation and cart-sheds for the council's working staff. The corn-store, hay-chambers, &c., are planned over the stable. The materials proposed to be used are red bricks, with Bath stone dressings, wood cornices to eaves, and red Ruabon tiles to roofs. All mouldings and other finishings are to be of a simple character. Internally, the floors of the entrance-hall and landing to be of wood blocks. The vestibules and lavatories of tiles, the council-chamber and other rooms best 1½in. St. Petersburg flooring in narrow widths. The council-chamber to have a dado of wood panelling, the main stairs to be York stone.

ADDITIONS TO BARTON COURT HOTEL, BARTON-ON-SEA, HANTS.

The new wing to this hotel, which is now in course of erection, will contain a large new entrance hall and lounge, dining-hall (capable of seating over 100 guests), extra suites of private rooms, kitchen, servants' hall and offices, and upwards of 30 new bedrooms. The dining-hall, of which we publish an interior perspective, will have large mullioned and transomed windows commanding uninterrupted views of the Needles and the Isle of Wight on the east. The western side has a fine outlook over Bournemouth Bay to Swanage, and the large bay window facing south looks directly on the English Channel. Each of these windows gives access to the lawns which extend to the cliffs and the easy approaches to the beach. The works will be completed during the present summer season. The architects are Messrs. Dancaster and Rogerson, of Bournemouth and London.

PALACE OF COUNT KOTTULINSKY IN GRAZ.

This handsome staircase executed in marbles has been designed by M. L. Gunold, the architect, whose work is enriched by gilding and colours freely introduced, producing a rich and dignified effect. We have no other particulars of the undertaking.

CHIPS.

Mr. John Weekes, the oldest resident of Dodbrooke, Plymouth, died on Thursday in last week, in his 92nd year. Deceased for many years carried on a successful building business, and had long retired.

The centre lights of the large eastern window of the chancel aisle in the parish church of Spaxton have just been filled with rich stained glass, the subject being Christ before the Doctors in the Temple.

The dedication of a stained-glass window in memory of the late Sir T. Percival Heywood took place in the church of St. John the Evangelist, Miles Platting, Manchester, on Saturday afternoon.

The Plans Committee of Aberdeen Town Council had before them on Friday plans of thirteen new erections. The value of the buildings is estimated at £27,000. One of the buildings is a new school in Hanover-street to cost £10,000.

A Joint Committee of Parliament which has been appointed to inquire into the various schemes for the supply of electricity which are now before the public, and to frame suggestions for the guidance of the companies, held its first sitting on Friday.

The school board for Rochester have adopted plans by Mr. G. E. Bond, M.S.A., of that city, for new schools in Gordon-road, estimated to cost £5,000.

At Penzance, on Friday, a block of new Church day-schools, erected close to the Western Promenade, was dedicated by the Bishop of Truro, and opened by Lord Cross. The schools accommodate about 630 children. There are three wings, the central hall, which will form the assembly-hall, and two classrooms, the eastern comprising four girls' classrooms, cloak-rooms, and other offices, and the western wing, where accommodation is provided for the boys. At the rear are playgrounds. A feature of the central floor is that it is laid with wood blocks. The elevations are of granite dressings, with Castle-an-Dinas stone fillings. The contract was about £3,300, and the building was designed by Mr. Oliver Caldwell, F.R.I.B.A.

The village of Bickenhill was *en fête* on Friday, on the occasion of the commemoration of the restoration of the tower arch of the parish church, the rehanging of the bells (after a lapse of over twenty years), the dedication of a stained-glass window, and the consecration of a new churchyard by the Bishop of Worcester. The tower of the church was struck by lightning in 1876, and when it was restored ten years later it was found impossible to raise sufficient funds to replace the five bells. Now, however, the difficulty has been overcome.

The new Victoria Sunday-schools, erected in connection with the Tabernacle Chapel, Old Hill, Staffs, was opened on Monday. The schools have been erected by Mr. H. Dorse and Son, of Cradley Heath, from designs by Mr. A. Ramsell, architect, of Dudley, at a cost of £2,000.

PARLIAMENTARY NOTES.

South Kensington Museum.—Sir S. Montagu asked the First Commissioner of Works on Friday whether, on the enlargement of South Kensington Museum, he intended that laboratories should be placed under the same roof as the works of art; and whether he had ascertained that no damage to pictures and silver could result from the generation of gases and other noxious fumes. Mr. Akers-Douglas: No, sir; it is not intended to place any laboratories under the same roof as the objects of art at South Kensington, so that I do not see how any damage can be occasioned to the works of art. As I have already announced, the allocation of the space in the new building is now being considered by a departmental committee.—On Monday night Sir C. Dilke further inquired of the First Commissioner of Works what portion of the new buildings at South Kensington under the Public Buildings Expenses Act was to be devoted to the housing of the art collections, and what portion to services connected with science; whether the space given to art was to be trenched on by the importation into the art part of some science collections at present housed on the western side of Exhibition-road, and to what extent; whether it was computed by the Lords of the Council that the space assigned to art would suffice for the due exhibition of the magnificent collections at present in the South Kensington Museum; and whether the Lord President of the Council had consulted on the proposed distribution of the new available space the Art Committee of Referees. Mr. Akers-Douglas: It is impossible at the present stage to reply to the right hon. gentleman's question categorically. An Inter-Departmental Committee, appointed by the Lord President of the Council and myself, are now engaged in considering the details of the appropriation of the site to the east of Exhibition-road, and that committee have called upon the architect, Mr. Aston Webb, whose design was approved in 1892, to prepare a modified plan showing how the art collection can be housed, subject to the condition that the Royal College of Science, already placed upon the east side of the road, shall be so enlarged as to accommodate other services connected with science, which have been specified by the Lords of the Council. When the new plans have been prepared, I shall be in a position to reply to the right hon. gentleman's question, and I will give him due notice.

The restoration of Bradford parish church was agreed to at the annual vestry meeting held on Monday. The Bolling Chapel, in connection with the edifice, is to be included in the restoration. There is to be a second holy table for week-day communions, a screen erected in front of the Bolling Chapel, and a screen in front of the chancel. As the Church Congress is to meet at Bradford this year, the work of the church restoration is to be expedited.

At a recent sale at Christie's the main portion of the collection of the late Mr. J. Grant Morris, of Allerton Priory, Liverpool, and 36, Grosvenor-place, London, was knocked down to various buyers for an aggregate sum of £22,000. The prices of works by modern artists showed a marked falling off.

At the parish church of Bledlow, South Bucks, an east window, altar, chancel screen, and litany desk, forming a memorial to the late Miss Mary Greenside, have been dedicated. The east window is filled with stained glass of Early Renaissance character representing the Ascension, and has been executed by Messrs. Ernest Suffling and Co., of Maida Vale, W. The screen is Early English in character, and, together with the altar and litany desk, was carried out by Messrs. Harry Hems and Sons, of Exeter.

An appeal has been issued by the corporation of the Church House, Westminster, for funds with which to carry out the erection of the second section of the building. The chief room will be the permanent meeting-place of the House of Laymen. In addition to this, the west side will also contain nineteen rooms, to be used for letting as offices to church societies. The cost of the erection of this west side is estimated at £18,000, towards which sum £7,100 has already been subscribed.

On Monday afternoon the Bishop of Southwell consecrated St. Augustine's Church, erected in New Normanton, a growing suburb of Derby. The whole of the building has not been completed, but the total cost will be £5,000.

Lord Morley's Committee of the House of Lords passed on Tuesday the City and South London Railway Bill, which confers power upon that company to acquire further lands and construct sidings upon their authorised extensions. The Bill also empowers the company to raise £133,000 additional share and loan capital. The powers originally sought to sell a portion of their undertaking to the City and Brixton Railway Company were struck out of the Bill in its passage through the House of Commons.

PROFESSIONAL AND TRADE SOCIETIES.

Bristol Society of Architects.—The annual general meeting of this society was held at the Fine Arts Academy, Queen's-road, on Tuesday, Mr. F. W. Wills in the chair. The president, Mr. W. L. Bernard, F.R.I.B.A., and vice-presidents, Messrs. Joseph Wood and W. V. Gough, were re-elected, and a vote of thanks was accorded to the retiring hon. secretary, Mr. W. S. Skinner. Mr. H. Dare Bryan was elected hon. secretary for the ensuing season.

Coventry and District Builders' Association.—A dinner in connection with this Association took place at the Queen's Hotel, Coventry, on Tuesday week. There were present Councillor Haywood (who presided), Mr. J. Worwood (vice-chairman), Messrs. J. E. Swindlehurst (city engineer), E. K. Purnell, W. Hattrell, Harrison, C. Garlick, jun., G. E. Jenkins, Bindley, Bowen (Birmingham Builders' Association), Foster, T. Checkland, T. G. Golby, G. Blakeman, J. H. Cox, G. Storer, H. G. Storer, W. O. Ivens, T. W. Liggins, H. Whiteman, W. Harper, J. Wetton, Grant, Sutton, W. Everitt, Kelly, Isaac, A. Cave, F. R. Carter, C. H. Barber, H. Taylor, C. Watts, J. W. Hogg, &c. The vice-chairman, in proposing the toast of the "City Authorities," referred to the interpretation of the by-laws of the corporation and the borough surveyors. The builders, he said, had hitherto worked harmoniously with the city council, and they hoped in the future to work with equal harmony. The Builders' Association did not want to throw the slightest obstacle in the carrying out of the corporation's object to insure the health and long life of those who occupied houses. The chairman, in replying to the toast, said the by-laws devised five or six years ago were being carried out by a newly-appointed borough surveyor, and some of the builders thought that he had put a wrong construction upon them, but he had no doubt that in the course of a few months everything would be amicably arranged. The surveyor's report on the builder's memorial was under the consideration of a sub-committee. Alderman Bowen proposed the toast of "The Coventry and District Building Trades' Federation." W. O. Ivens and Mr. Harper responded. Mr. T. G. Golby gave the toast of the "Architects, Surveyors, and Engineers." The borough engineer, Mr. Swindlehurst, who was cordially received, in reply to the toast, said a public officer who liked to close his eyes and see nothing might have a nice, quiet, comfortable berth. If he did his duty, his position must be one of unimpeachable integrity all along the line. The by-laws were perfectly plain, and had been in use in Coventry for a number of years. If they were not equitable, then the proper thing to do was to get them amended in such a way as to make them proper by-laws. But as long as they stood there could be but one interpretation put upon them. During the evening a presentation was made to Mr. Garlick, jun., in acknowledgment of his services as hon. sec.

Institution of Civil Engineers.—At the general meeting of the Institution of Civil Engineers, held on Tuesday, Sir John Wolfe Barry, president, in the chair, the result of the ballot for the election of officers was declared as follows:—President, Mr. W. H. Preece, C.B.; vice-presidents, Sir Douglas Fox, Mr. James Mansergh, Sir William Anderson, and Sir William White; other members of council, Mr. James Barton (Dundalk), Mr. Horace Bell, Sir Alexander Binnie, Mr. Thomas Forster Brown (Cardiff), Mr. Henry Deane (Sydney), Mr. W. R. Galbraith, Mr. George Graham (Glasgow), Mr. J. C. Hawkshaw, Mr. Charles Hawksley, Mr. G. H. Hill (Manchester), Dr. Hopkinson, Mr. J. C. Inglis, Mr. Alexander Izat (India), Dr. Alex. B. W. Kennedy, Mr. John Kennedy (Montreal), Sir James Kitson, M.P. (Leeds), Mr. A. G. Lyster (Liverpool), Mr. William Matthews, Sir Guilford Molesworth, Sir Andrew Noble (Newcastle-on-Tyne), Mr. Alexander Siemens, Mr. Thomas Stewart (Cape Town), Mr. F. W. Webb (Crewe), and Sir Leader Williams (Manchester).

Newcastle, Gateshead, and Tyne Master Builders' Association.—At the annual meeting of this Association, held on Tuesday, Mr. Walter Lowry was unanimously re-elected President for the ensuing year. In his opening address, Mr. Lowry remarked that during last year the Association had held a large number of meetings owing to disputes with some of the trades, but taking the year's working on the whole, it might be considered very satisfactory. One matter of very great importance to the building trade had been accomplished. He referred to the formation of the Northern Counties Federation of Building Trade Employers, the first general meeting of which would be held in a fortnight, when the Federation would be in working order. Great success had attended its formation, as the whole of the Master Builders' Associations in Northumberland, Durham, Westmoreland, and Cumberland (with the exception of one with whom negotiations were pending) had consented to join. Federations of a similar nature were being formed in most of the other counties in England, with the intention eventually of all joining together and forming a National Federation of the Building Trade Employers of England. He wished it to be clearly understood that the objects of this Federation were conciliatory to the operatives, and that it would in all cases of dispute with them, do its utmost, by arbitration or otherwise, to avoid strikes and lock-outs. After the election of officers, the notices for advances in wages received from the Operative Stonemasons' and the Carpenters' and Joiners' Societies were considered. In both cases, after considerable discussion, it was decided to make a counter-offer of ½d. per hour advance from 9d. to 9½d. in place of the 1d. requested; the offer to the stonemasons to be subject to their reverting to the nine-hours day.

Scottish Building Trades Federation.—The half-yearly meeting of this Federation was held on Friday afternoon in the Palace Hotel, Aberdeen, Mr. John B. Hay, builder, Dundee, president, in the chair. Representatives were present from all parts of the country, including Glasgow, Edinburgh, Dundee, Aberdeen, Inverness, Oban, Hawick, Perth, and Dunfermline. The secretary, Mr. James L. Selkirk, C.A., Glasgow, submitted his report regarding the progress and consolidation of the Federation throughout the country, from which it appeared that additional branches had been formed in most of the towns and districts which had not already been organised. Arrangements are in progress for overtaking other places not yet dealt with. The interest in the work of the Federation was manifestly deepening in all parts of the country, and would be further exhibited as the advantages of federation came to be more fully realised. Various matters were discussed by the meeting, and among the principal were the Workmen's Compensation Act, and the question of insurance arising out of it. A committee was appointed to ascertain the most advantageous terms on which insurance could be effected, and to recommend accordingly.

Sheffield Society of Architects and Surveyors.—The eleventh annual report of the council of this society, presented at the meeting held on Tuesday night, states that the society is in all respects in a better position than at any previous period of its history. Financially, the balance in hand is the highest that has ever been reported, and this notwithstanding that there has been a special course of class lectures during the present year. The council recommend that the balance at present in hand, £121 18s. 7d., be invested as a reserve fund. Numerically, the society has continued to grow, and although there have been two deaths, two withdrawals, and three lapses of membership during the year, there has been a net increase of eight in the number of members. There are now 114 members, consisting of 31 fellows, 43 associates, 18 students, 5 honorary, and 17 lay members. The council refer with regret to the deaths of Mr. T. H. Wilson, who had been a fellow from the formation of the society, and of Mr. B. D. Wrangham, who was one of its earliest lay members, and who presented some interesting Roman tiles to the museum. Hitherto, in addition to the officers and elected members of the council, the past presidents have been members *ex-officio*, four fellows and one associate being elected. In future, according to Rule 7 as altered, only the ex-president—that is, "the latest past president," will be retained on the council without election, in addition to the officers and the elected members—viz., four fellows and two associates. In consequence of the valuable additions recently made to the library, it has been thought advisable to insure the society's property from fire; and in order to admit of the free use of the books, three members have, at the request of the council, kindly consented to take charge of the library—viz., Messrs. L. D. Hemsoll, S. D. Chipling, and W. J. Beall. The lectures of the session now closing have been of high character, as proved by the greatly-improved attendance, averaging double that of former years. A visit was paid, by invitation of Messrs. J. Grayson Lowood and Co., Limited, to their extensive brickworks at Deepcar, and the annual excursion was made in June to Chatsworth. Shortly after the last annual meeting the honorary secretary convened a meeting of associates and students to consider the best way of organising classes for the study of scientific subjects. A series of class lectures by Mr. Hugh Stannus, F.R.I.B.A., Lecturer at the Royal College of Art, was arranged, and 43 students attended the course, which dealt with Mouldings, Walls, and the Order. The honorary secretary, Mr. C. J. Innocent, some time ago intimated to the council that he wished to be relieved of the duties of the office at the end of the present year. The council asked him to reconsider the matter, but he thinks that other members should have the opportunity of working for the society. The following officers have been elected for the ensuing year:—President, Mr. R. W. Fowler; vice-president, Mr. J. Smith; hon. treasurer, Mr. F. Fowler; hon. secretary, Mr. W. C. Fenton; council: Messrs. C. Hadfield, E. M. Gibbs, C. J. Innocent, T. Winder, A. Smith Denton, J. R. Wigfull, and J. B. Mitchell-Withers.

CHIPS.

Mr. Marcus Houghton, who built the Roman Catholic cathedral and a number of other prominent buildings in Springfield, Mass., died there on April 11.

The long dispute as to the proposed building of a new tower for Liskeard parish church appears to have been settled, amended plans by Mr. John Sansom having been adopted by the vestry, who have petitioned the Chancellor of the Diocese to issue a faculty. The revised design shows a tower 85ft. in height (as against 59ft., the height of the tower which has been condemned as dangerous, and partially demolished by the borough surveyor); it is finished with a single angle-turret, and is estimated to cost £3,000.

The corporation of Bradford have under consideration a proposal to erect an art gallery over the market extensions, and if the two committees concerned agree on the scheme, it is proposed to throw the plan open to public competition.

On Saturday a stained-glass window, put into Heptonstall Church, near Hebden Bridge, by the Prince Frederic Lodge of Freemasons, was unveiled. The window is a four-light one, and depicts the dedication of a temple, as recorded in II. Chronicles vi. 12, 13. The window has been inserted in celebration of the sixty years' reign of Queen Victoria.

A new public road leading from the village of Sternfield, near Saxmundham, to Snape, Iken, and Orford, was formally opened on Wednesday week. It forms a Jubilee memorial, and replaces a narrow and steep lane, and has been carried out for the subscribers and local landowners by Messrs. Baldry and Newson from plans by Mr. Henry Miller, the county surveyor of Suffolk.

One of the best known figures in Somerset, Devon, and Dorset has been removed by the death of Mr. Frank Tooze Hussey, F.S.I., of The Grove, Cheddon Fitzpaine. Mr. Hussey died at his residence from heart disease. He was 53 years of age, and had been steward for Lord Portman's Somerset and Devon estates since 1883, and was appointed sole agent on the death of Mr. Henry Parsons, of Misterton.

There was erected on Friday in Lasswade churchyard, N.B., over the grave of the late Rev. Dr. Walter Gregor (1825-97), of Pitsligo, a monument of unpolished red granite. In form it is a Celtic slab, resting upon a basement of three massive steps, in reproduction of the early Scottish style of sculptured stone slabs. On the upper part of the stone is an ornamental Celtic cross set in a panel, and beneath runs the inscription carved in raised letters. The monument was designed and executed by Messrs. M'Glashan and Son, sculptors, Edinburgh.

It was reported to the City Court of Common Council at the last meeting that the cost of the new office erected by the late Commission of Sewers in Basinghall-street was £20,700. The contractors were Messrs. J. Chessum and Sons.

Next month application is intended to be made to the Light Railway Commissioners (under the provisions of the Light Railways Act, 1896) for powers enabling the promoters to construct light railways in and between Redditch, Headless Cross, Crabb's Cross, and Astwood Bank.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers so complete volume just ended should order at once, at many of them soon run out of print.

KIRKHAM WORKHOUSE COMPETITION.

To the Editor of the Building News.

Sir,—There are always two sides to a question. I should like you to give a Liverpool man's views. Mr. Crickmay has a son practising as a quantity surveyor, and naturally, he would prepare the quantities. Local builders are so unaccustomed to London quantities, that in the majority of cases that we have come across they have not got the contract, which we have known go to London (usually), or to the Midlands, or Scotland. These contractors naturally employ most of their skilled artisans from their own town, and as the guardians are spending public money, it is a case of disappointing local architects, local quantity surveyors, local builders, and local artisans; or of disappointing Messrs. Crickmay and Son, and we think they are wise in chosing ratepayers. It may be urged that they should limit the competition to local architects; but they want the best design they can get, and they should pay Messrs. Crickmay and Son for it, so that the whole or part may be incorporated in the building as carried out.

In some Yorkshire towns there is a combination between the builders and the quantity surveyors to defeat any London architect carrying out work if they insist on employing London quantity surveyors, and consequently giving an advantage to alien builders and workmen; but if Messrs. Crickmay think they can do better by going to law, by all means let them try. The guardians will have the full sympathy and support of the ratepayers, whatever they have of the architectural world.—We are, &c.,

Steward and Ashworth.

41, Castle-street, Liverpool, April 26.

DUKINFIELD TOWN HALL COMPETITION.

Sir,—Having sent in plans for the above, we beg to be allowed to make a few remarks in reference to the award recently made by the district council as regards the first premiated design under motto "Astley."

Being amongst the unsuccessful competitors, we were anxious to ascertain in what respects we and others had failed, and with that intent we went over to Dukinfield to inspect the designs, which were publicly exhibited in the Technical School. There were twenty-two sets sent in by twenty-one firms, and according to a report which appeared in the Manchester and other local papers, "All the designs were of exceptional merit." What was our astonishment to discover that "Astley" had submitted two perspectives, alternative designs—both highly coloured, and framed and glazed into the bargain. The following are extracts from the Conditions of Competition and Instructions to Architects:—"The elevations and sections must be mezzotint or Indian ink, with no colour excepting the ashlar, which may be tinted light blue, or terracotta light red," "the whole of the drawings to be mounted on plain stretchers—*no framed or glazed drawings will be adjudicated upon.*"

The council, in the instructions, reserved to themselves the right to call in an assessor to advise them in the selection. We need hardly say that no professional assessor was called in, a resolution by a member of the council, that one should be appointed, not finding a seconder.

From a close inspection and comparison of the plans, we have no hesitation in saying that the limit of cost (£7,000) would be very largely exceeded if either of the designs by "Astley" were carried out as shown by the perspectives; and, judging by the reports in the local press, this appears to be recognised, as the cost is therein put down at £10,000.

As the designs sent in hailed from London, Manchester, Liverpool, and other large towns at a distance, it is hardly likely that many of the competitors would have the opportunity of knowing what had been done; and we think it only right that those who are conversant with the facts should enter a protest against such a flagrant act of injustice, and not to allow such an insult to the profession to go unnoticed.—I am, &c.,

April 26. Fairplay.

The partnership hitherto subsisting between Mark H. Judge and H. G. Gardner, sanitary surveyors, architects, and engineers, Pall Mall, S.W., under the style of Mark Judge and Gardner, has been dissolved.

The Unopposed Bill Committee of the House of Commons have passed the Various Powers Bill of the Mersey Docks and Harbour Board, under which power is given to the board to borrow £1,400,000 "for the purpose of recouping to revenue the moneys advanced" for the completion of already authorised works.

The temporary iron church known as St. Paul's, North Shore, Blackpool, is about to be replaced by a permanent structure. The committee have already built a vicarage, and a large Sunday-school is now in course of erection, which will be opened in June. The plans for all the above buildings have been prepared by Messrs. Garlick and Sykes, of Preston and Blackpool, and the contractors are Messrs. Joseph Fielding and Sons, of Blackpool.

The tower of the parish church of Ashill, Norfolk, is being restored. The whole of the upper portion is to be taken off, and a new parapet of Ketton stone and flint, with the addition of string-courses and moulded battlements, put on. The whole of the timbers and leadwork are to be new. At the completion of the work to the tower the bells are to be rehung. The work is being carried out by Messrs. Waters and Son, builders, Watton, Norfolk. The plans are by Messrs. Milne and Hall, architects, London. The church has recently been fitted with hot air apparatus.

The renewal of business at the Auction Mart last week was marked by exceptional activity, and the attention of investors has been directed more strongly than ever to investments in house property, which are not subject to violent daily fluctuations. The supply, moreover, was uncommonly good last week, and the highly satisfactory aggregate of £214,791 was recorded, a considerable figure at this early period of the season.

Intercommunication.

QUESTIONS.

[11937.]—**Powder Magazine.**—Shall be glad if some kind and able readers could give particulars of construction of powder magazine. How is the roof generally constructed?—Enquirer.

[11938.]—**Skittle Alley.**—Would some reader of the Building News inform me where information regarding size, construction, and cost of building a skittle alley can be obtained? Is there any book on the subject?—E. B.

CHIPS.

The Jubilee clock-tower at Kingswood, near Bristol, is on the eve of completion. Mr. T. Mackay is the architect, and Mr. A. Amos the builder.

Messrs. Doulton's pottery works at Burslem were partly destroyed by fire on Friday, the loss amounting to £10,000.

At Colne, Lancs, on Friday, a Local Government inquiry was held into an application by the corporation to borrow £10,000 for purposes of efficiently sewering and paving Keighley and Albert roads, two principal highways, also £1,200 with which to decorate and fit up the town-hall internally with requisites. There was practically no opposition.

The new duplicate pumping engine of the Ipswich Corporation waterworks was formally started on Thursday in last week. It is a triple-expansion Worthington, designed to pump two million gallons in 24 hours, and was constructed, like the fellow horizontal engine built in 1893, by Messrs. Simpson and Co., of Pimlico. The new building for engine and boiler has been erected by Mr. Chas. Borrett, of Ipswich, from plans by Mr. Hamlet Roberts, the water engineer to the Ipswich Corporation.

The formal opening of a new infant school, belonging to the Ruabon United District School Board, took place on Thursday in last week at Rhosllanerchrugog, Ruabon. The cost of the building was £4,000.

A new drinking fountain, erected in honour of the Diamond Jubilee, will be inaugurated at Curdridge, Hants, next week. It has been erected by Messrs. Garrett and Haysom, of East-street, Southampton.

At the Birkenhead Police-court, on Friday, Messrs. J. Lloyd Jones and Co., Lord-street, Liverpool, were summoned to show cause why a distress warrant should not be issued on account of certain moneys due to the corporation for improvements done to private streets adjoining their property. The sums amounted to £118 11s. 5d. Defendants contended that the improvements were unnecessary, but judgment was given against them.

At the end of last year the corporation of Shrewsbury applied to the Local Government Board for power to borrow £48,000 for the purpose of a new water supply, and a lengthy Government inquiry into the question was the result. The Local Government Board has now intimated its refusal to sanction the loan.

A start was made last week with the restoration of the tower and the re-casting and re-hanging of the peal of bells at the parish church of All Saints, Northallerton. The work has been intrusted to Messrs. J. Warner and Sons, of London. In addition to re-casting two of the old bells and re-tuning the whole peal, Messrs. Warner and Sons will provide eight sets of new bearings and gudgeons and a new set of ropes.

The adjudication in bankruptcy is announced of Henry George Curry, Charles Edward Simpson, and William Alfred Curry, described in the receiving order as Curry, Simpson, and Curry, of Walbutton-road, Brockley, S.E., builders.

A Committee of the House of Commons has passed the Bill promoted by the Ipswich Dock Commissioners for powers to construct additional bridges, landing stages, tramways, and other works in connection with their dock undertaking. For the execution of these works the commissioners are empowered to borrow a further sum of £35,000 upon mortgage of the rates and duties leviable by them. As regards the proposed tramways, provision is made in the Bill for their construction and maintenance by the Great Eastern Railway Company, who are empowered to use locomotives on the tram lines subject to the consent of the commissioners and the Corporation of Ipswich.

Memorials to two celebrated sanitarians, Sir Edwin Chadwick and Sir Benjamin Ward Richardson, are being promoted by the Sanitary Inspectors' Association. The object is to provide funds sufficient to give annual premiums, in money, books, medals, &c., to students in sanitary science at technical colleges. Sir John Hutton, president of the Sanitary Inspectors' Association, has contributed £52 10s. to the fund, and an anonymous donor has given a like amount.

LEGAL INTELLIGENCE.

Is a Contractor's Stoneyard a "Nuisance"?—Howland v. Dover Harbour Board.—In the Court of Appeal, on April 22, before the Master of the Rolls, Lord Justice Rigby, and Lord Justice Collins, decision was given in an appeal from a decision of Mr. Justice Romer. The action was brought by a lady who was the owner of Connaught House, a private hotel in Waterloo-crescent, Dover, for an injunction and damages in respect of nuisance and injury caused by the defendants' works on an open space immediately in front of her premises. The defendants, who were the Harbour Board and their contractor, were using the space for works in connection with the construction of the new breakwater, and the plaintiff complained of the noise and vibration, which, she said, had caused cracks in the fabric of her house, and driven away her customers. Mr. Justice Romer, although satisfied that the plaintiff had suffered considerable annoyance, held that it did not amount to a nuisance at law, and he dismissed the action. The plaintiff appealed, but she did not either in the Court of first instance or upon the appeal insist upon her right to an injunction. The Court allowed the appeal. The Master of the Rolls thought that the learned Judge had minimised the evidence of nuisance adduced on behalf of the plaintiff. The Harbour Board were authorised by Act of Parliament to construct a new harbour, and for this purpose huge blocks of concrete were required. The contractor had obtained from the Harbour Board a piece of land where he manufactured these blocks of concrete, and he also obtained from them the right to use the piece of vacant land in front of the plaintiff's house for the purpose of storing the concrete blocks. The mere fact that this vacant piece of land was turned into a stoneyard caused a considerable amount of damage to the plaintiff's business as an hotel-keeper, but for that she had no right to damages because there was no actionable injury. The contractor had done no more harm than was reasonably necessary for the purpose for which the land was acquired. It was necessary, in order to move these heavy blocks, to lay down a tramway and to employ steam-engines and steam-cranes, and the result of all this had been very serious to the plaintiff. The principles to be applied in a case of this kind were laid down by Lord Justice Mellish in "Ball v. Ray." His Lordship thought that the evidence showed clearly and distinctly that both the comfort of the plaintiff's house and also the plaintiff's trade as a lodging-house keeper had been seriously interfered with by the defendants' operations, quite apart from the annoyance which the plaintiff had suffered by having a stoneyard next her house instead of a vacant piece of land. Then the question was, who was liable? The injunction had been waived, and it was a question of damages only. The contractor was liable, of course; but were the board liable also? If a contractor was employed to do a piece of work, the employer was not liable for what might be called collateral negligence on the part of the contractor. But here there was no question of negligence. The principle upon which the board were responsible was that they had allowed the contractor to use this piece of land for the very purpose to which he applied it, and the necessary consequence of that, in the ordinary business sense of the word "necessary," was a nuisance. In other words, the board committed the nuisance by their contractor. The appeal should be allowed, and judgment should be given for the plaintiff against both defendants, the amount of the damages to be assessed by an official referee. Lords Justices Rigby and Collins gave judgement to the like effect.

Liability to Repair Footbridges.—Cuckfield Rural District Council v. Goring.—In the Queen's Bench Division, on Monday, before Mr. Justice Wills and Mr. Justice Kennedy, judgment was given in an appeal by the defendant from the decision of the County-court Judge of Sussex sitting at Worthing. The action was brought under section 25 (2) of the Local Government Act, 1894, which provides that "where a highway repairable *ratione tenuræ* appears on the report of a competent surveyor not to be in proper repair, and the person liable to repair the same fails, when requested so to do by the district council, to place it in proper repair, the district council may place the highway in proper repair, and recover from the person liable to repair the highway the necessary expenses of so doing," to recover the cost of repairs executed by the plaintiff council to two foot-bridges which, it was alleged, the defendant was liable to repair *ratione tenuræ*, as owner of two farms. The learned County-court Judge held that a liability to repair the foot-bridges attached to the farms in question, and he further held that under section 25 (2) of the Local Government Act, 1894, proceedings might be taken against the owner of lands to which such an obligation attached, and he gave judgment for the plaintiffs. The defendant appealed. Mr. R. E. Moore appeared for the defendant, and contended that proceedings under the enactment in question could only be taken against the occupier of the lands subject to the liability, and he cited "Reg. v. Barker," "Baker v. Greenhill." Mr. Dickens, Q.C., and Mr. Boxall, on behalf of the plaintiffs, argued that although an indictment for non-repair can only be preferred against the occupier, still the ultimate liability is upon the owner, who is liable to reimburse the occupier the expenses incurred in repairing the way. They pointed out that in "Baker v. Greenhill" Lord Denman spoke of the owner as the person who "ought to have repaired." They also cited "Reg v. Bucknell." The Court allowed the appeal. Mr. Justice Wills said he failed to understand the argument for the respondents, and felt no doubt on the matter. At the passing of the Local Government Act, 1894, it was well-established law that the occupier of land subject to a *ratione tenuræ* liability for the repair of highways is the only person who can be made to perform the obligation. As Lord Coleridge said in "Reg v. Barker" that a proposition had been established from the time of Rolle's Abridgment, where (p. 783) it is laid down both in the positive and negative that you must indict the occupier and cannot indict the owner. The passage in Rolle's Abridgment did not in terms refer to highways repairable *ratione tenuræ*, but in subsequent cases it had been pointed out that it was intended to refer to such highways. There was, therefore, old authority for the proposition that the occupier is the only person against whom the liability can be inforced. As between the owner and the occupier, the occupier no doubt had a right to be reimbursed; but that was a matter as between them with which the public had no concern. It was suggested, on the strength of the chance expression in "Baker v. Greenhill," "the owner who ought to have repaired," that there was, what all the authorities had repudiated, a liability on the owner's part to repair, as distinguised from a liability to reimburse the occupier the expenses incurred by him in repairing. But his Lordship could not accept that suggestion. Then section 25 (2) of the Act of 1894 simply provided a new and less cumbrous means of getting repairs done and paid for. It was, therefore, quite clear that the proceedings were misconceived, and the appeal must be allowed. Mr. Justice Kenuedy concurred.

Gas Refuse and River Pollution.—A Divisional Court of the Queen's Bench, on Saturday, heard an appeal by the corporation of High Wycombe against a conviction of them by the local magistrates, at the instance of the Conservators of the River Thames, for wilfully suffering offensive matter to pass through their sewage works into the River Wye, a tributary of the Thames, whereby a number of fish were killed. The offensive liquid came from the gasworks, and the Gas Company had been proceeded against and fined. The corporation contended that they had not been guilty of any wilful suffering of the pollution, and Justices Grantham and Kennedy, arriving at the same conclusion, quashed the conviction.

Main Drains v. Sewers.—Blundell v. Price.—This case came on Monday for argument on appeal from the Birmingham Police-court, before Mr. Justice Wills and Mr. Justice Kenuedy, sitting as a Divisional Court in the Queen's Bench Division. Mr. Lawson Walton, Q.C., M.P., who appeared for the appellant, said this was an appeal by way of special case from a decision of the justices of Birmingham, and the question was whether the system of drainage which was organised by the appellant in regard to some new buildings was or was not adequately ventilated in accordance with the by-laws of the corporation of Birmingham. Mr. Justice Wills: He says they are main drains, and not sewers. Does it not come under the Public Health Act? Mr. Walton said there was a section which no doubt applied to the matter, but there was a by-law which had been specially framed. Mr. Justice Wills said under the Public Health Act there never was much difficulty in saying what a drain was. Mr. Walton said there was no doubt that a drain which drained more than one building was a sewer. The by-law qualified the generality of the statutory definition. The case stated that the appellant was charged upon an information of the Corporation that on October 18, 1897, at Charles-road, he did unlawfully break the by-law in question, No. 61, by neglecting to provide for a main drain for certain new buddings then being erected on the west side of Charles-road a suitable trap for ventilation as provided by the by-law in question. There were a block of new houses belonging to one owner all being built at the same time. The contention of the appellant was that the whole of the sewage pipes belonging to these six houses were, strictly speaking, a drain: that was, although they communicated with the main drain down a passage, yet all the pipes retained their character of drains as distinct from a sewer. Mr. Justice Wills: The appellants want to make one ventilating trap do for each three houses, and the Corporation want a trap for each house. Mr. Walton said that was exactly the point, and it was more or less a question of expense. The Corporation said that to each pipe, shortly after it left each house there ought to be a separate ventilating trap, and there ought to be six in place of two, which the appellants proposed to make. He contended that under the circumstance by-law 61 had been sufficiently complied with. Mr. Justice Wills said he could not persuade himself that there was any doubt about the case, and he thought the magistrate had come to a right conclusion. There was only one question in these cases, and that was what was the meaning of the word "drain" in the 61st by-law, and what was the meaning of the word "sewer," and how these two terms were to be applied. The definition of the Public Health Act, which was the one that governed the case, was that a drain was a drain so long as it received the drainage of one house, but directly it received the drainage of two houses it became a sewer. The appeal must therefore be dismissed, with costs.—Mr. Justice Kennedy concurred.

Re Francis Morton and Co., Limited (in Liquidation).—The adjourned hearing of the petition presented by the Pearson and Knowles Coal and Iron Company, Limited, for the compulsory winding up of this company, or in the alternative for the winding up under the supervision of the Court, came on on Monday. Unsecured creditors to the amount of over £16,700, and also the second debenture holders, appeared in opposition to the petition, and urged that it should be dismissed. The Vice-Chancellor held that in the absence of complete particulars he was not in a position to give a decision and make an order. He accordingly directed the matter to stand over until the end of July next, in order to allow an opportunity of completing negotiations for the sale of the business as a going concern.

Defrauding the Manchester Corporation.—At the Manchester Quarter Sessions, on Wednesday, John Tetlow, 40, managing director of John Tetlow and Sons, contractors, Littleborough, and David Hallard, 53, clerk in the paving department of the Manchester Corporation, pleaded "Guilty" to having conspired to defraud the corporation. Mr. Byrne, for the prosecution, said the evidence disclosed frauds extending over 10 years, amounting to £4,819. Tetlow had substituted for the correct accounts made out monthly by a clerk of his own firm other accounts that were in excess and Hallard had passed them. The excess sums were then divided between the two. Tetlow paid them into his private bank account, and drew on it for the correct sums due to his firm. Hallard, when arrested, told the police he had never received more than £30 in any month. Mr. O. Evans and Mr. Pope addressed the Court on behalf of Tetlow and Hallard respectively. The latter's salary was stated to be £2 a week, and he had been in the corporation's service for 22 years. The Recorder sentenced each of the prisoners to three years' penal servitude.

Property Compensation Case in Stockwell.—At the Sheriff's Court, Red Lion-square, Holborn, on Wednesday, Mr. Burchell and a special jury heard the case of "Lady Mary Bacon's Executors v. the London School Board." This was a claim for compensation for the leasehold interest in houses Nos. 74 and 76, Santley-street, Stockwell, and for injuriously affecting the adjoining houses by the erection of a board school. The value of the two houses taken was estimated at £816, and the depreciation of the adjoining houses at £50 per house. The expert who gave evidence for the claimants were Mr. E. F. B. Fuller (Messrs. Fuller and Fuller) and Mr. J. T. Skelding (Messrs. W. W. Read and Co.); while those on behalf of the School Board were Mr. Samuel Walker (Messrs. Walker and Son), Mr. Henry Arthur Drew (Messrs. Drew and Sons), and Mr. Douglas Young (Messrs. Douglas Young and Co.) Sir William Marriott objected to any claim in respect of the probable depreciation of the adjoining property by reason of the user of the school as a school. He said the matter would shortly be argued at length before the High Court, and unless the jury adopted his witnesses figure of about £600 for the houses actually taken and confined their attention to that question, he must ask for the items to be specified in the verdict. The Under-Sheriff said the question was one of far-reaching importance, and, in view of the fact that the point would be dealt with in the High Court at an early date, he directed the jury to state the items of their verdict. The jury awarded the claimants £762 10s. in respect of the houses actually taken by the Board, and £100 in respect of the probable injury to the claimant's adjacent houses by the user of the school.

A window at the back of the altar in the chapel of St. Anne, on the south side of Malvern Priory, has been filled with stained glass depicting the history of the Priory. The artist is Mr. C. E. Kempe.

Application is to be made during May to the Light Railway Commissioners to sanction the construction of a 2ft. gauge light railway from Minehead to Lynmouth. The route has been surveyed and plans drawn. The length of the proposed line is 20 miles, and its cost including rolling-stock, is estimated at £5,000 per mile.

WATER SUPPLY AND SANITARY MATTERS.

The London County Council (Acton Sewage) Bill.—This Bill has been before the Select Committee of the House of Commons. The object of the Bill is to require the Acton Local Board, whose sewage passes through the Metropolitan main drainage system, to bear their share of the cost of the original construction of that system and its maintenance, the capital outlay having been some seven millions, and the annual cost of maintenance about a quarter of a million. Sir Alexander R. Binnie, the chief engineer of the London County Council, was examined, and on the conclusion of his evidence the chairman said the committee were unanimously of opinion that nothing in the nature of back charges—such as were provided for in Clause 5—should be entertained by them. The only question, therefore, that remained to be dealt with was whether or not Acton should contribute to the cost of the main drainage system since the date of the deposit of the Bill. Clause 5 was then struck out, and the committee heard the evidence of Mr. H. Law, C.E., and Mr. Ebbetts, surveyor to the Acton board. Mr. Costelloe, appearing for the Vestry of Chelsea, said that at the present time Chelsea suffered considerable inconvenience and damage from the overcharged state of the sewers, owing to the Acton sewage passing through their sewers, and they did not wish that more should pass through in the future. Mr. Higgins, C.E., surveyor to the Chelsea Vestry, was called, and gave evidence in support of this contention. Mr. Pope, Q.C., then addressed the committee for the London County Council, and contended that this was an equitable demand on the part of the Council that Acton should pay its fair share of the cost of the drainage system which it used. After the committee had deliberated, the chairman said the committee were unanimously of opinion that the Acton local authority ought to make some contribution to the expense of the London County Council in respect of that portion of their houses which transmit sewage into the London sewers without a prescriptive right to do so. But the committee thought also that a clause ought to be inserted in the Bill giving to the Acton Local Board the power within two years to exercise the right of disconnecting their sewers for other than land water from the London County Council sewers, and that from the time that work was done their payment to the London County Council should cease.

Manchester. — Parliamentary powers were obtained under the Manchester Corporation Act, 1897, for laying an additional main pipe 30in. diameter from the Godley to the Audenshaw reservoirs, and, out of the total length of about 4¼ miles, about 1¾ miles have been laid. A new straining well has been constructed at Godley reservoir, and the branch 40in. main from this straining well to the existing 40in. main from the reservoir is also completed. The Thirlmere works have been maintained in full working order. The quantity of water supplied from Thirlmere during the last 12 months has been on the average about 7½ million gallons per day, out of an available quantity of 10 million gallons per day. All the contract accounts in connection with the construction of these works have now been settled, the award in the last arbitration for contract No. 7 having been made in February last.

CHIPS.

The foundation-stone of the new church of St. Oswald, Fulham, was laid by Lady Edward Spencer-Churchill on Monday. The new district is being formed out of St. John's, Fulham, with a portion of St. Andrew's, West Kensington, and the church is one of those for which a grant is proposed to be made from the Marriott bequest.

The House of Commons rejected, on Monday, by the majority of 364 votes to 84, the second reading of the Victoria Embankment and St. John's Improvement Bill. The promoters of the scheme engaged, it will be remembered, Mr. R. Norman Shaw, R.A., as their architectural adviser, but not until rather late in the day.

Mr. David Stewart, for the past fifteen years master of works to the University of Glasgow, died at his residence in the University building in that city on Monday.

The Wirral Railway Bill, empowering the Wirral Railway Company to make railways and other works at Wallasey, forming junctions with the Seacombe branch railway and the railway authorised by the Company's Act of 1895, passed the committee stage in the House of Lords on Monday. The Bill provides for the improvement of the line in Wallasey.

The great fire in Glasgow was successfully got under on Tuesday. The firemen succeeded in saving St. Andrew's Roman Catholic Cathedral, which was in imminent danger of destruction. Part of the roof of the edifice, however, was burned, and the vestry damaged.

Our Office Table.

Our readers will not have failed to notice that on Thursday afternoon in last week a lamentable fatal accident, involving the loss of seven lives, occurred at Abbey Mansions, Victoria-street and Orchard-street, Westminster, illustrated in our last issue. The catastrophe resulted from the collapse of the concrete roof, from which the wooden supports were being removed, and this, falling through all the floors, carried an immense quantity of *debris* into the basement. Six workmen were killed outright, another has since died, and about twenty were more or less seriously injured. The building was erected for Her Majesty's Office of Works, by whom it had been leased for 21 years for use by the Civil Service Commission as offices. It is a building of nine floors and about 300 rooms, and was erected by Mr. W. R. Rickard, contractor, of City-road, at a cost of £95,000, from the designs of Mr. C. J. C. Pawley, architect, of 2, Prince's-mansions, Victoria-street. There were, however, a number of sub-contractors. Quite recently that portion of the building which has collapsed was certified by the district surveyor as "completed" for rating purposes. The construction of this portion had been delayed owing to a question of ancient lights raised by the owners of the Catholic Apostolic Church in the rear. The inquest was opened on Monday, and, after evidence of identification, adjourned for a fortnight, for the production of an expert report by officials of the Home Office. At a meeting convened by the chairman of the Westminster Vestry, it was resolved to inaugurate a fund for the relief of the families of the dead and injured men.

The School Board for London recently received a communication from the Education Department containing a series of revised proposals as to sanctioning loans for works to schools. Their lordships desire to place loans upon a new basis, on the grounds that:—(1) It is desirable that the £10 limit should be applied to all ordinary expenditure. (2) The extra expenditure necessitated by the peculiar circumstances of London schools should be excluded from the £10 limit; and the loan for such things as latrines, drainage, and tar pavement should not be for a longer period than the provision will last. (3) Generally to place the department in general agreement with the school board as regards loans and allowances, so as to avoid the recurrence of difficulties. Their lordships are therefore of opinion that, in future:—(1) The £10 limit should include the whole of the building proper, exclusive of central halls, its warming apparatus and ventilation, as well as teachers' rooms, but not including any additional cost for the use of glazed bricks internally. (2) That the London School Board should be allowed a separate amount over the £10 limit for latrines and drainage, tar pavement, and boundary walls; but that this provision (except as regards boundary walls) should be the subject of a loan for a shorter period than 50 years—say 30, both in the case of new schools and subsidiary work for existing schools. (3) That the provisional amount for contingencies should be limited to the building contract itself, and should not exceed 2½ per cent., instead of 5 per cent. as hitherto allowed. At the meeting of the School Board held yesterday (Thursday), it was decided to reply to the department, stating that the board are prepared to accept these proposals, and that they assume that the arrangements hitherto in force, by which the cost of the following items, when they are rendered necessary, will be allowed as outside the £10 limit, are to be continued:—(i.) Expenditure for extra depth of foundations; (ii.) expenditure for works on site, or works to existing buildings; (iii.) the extra cost of erecting buildings on arches, when this is considered necessary, in order to avoid the purchase of additional land: and (iv.) the cost of providing playgrounds on roofs, also in order to avoid the purchase of additional land.

The Housing of Working Classes (Rural Districts) Bill, brought in by Sir W. Foster, Mr. Channing, and others, proposes to amend the Housing of the Working Classes Act, 1890, as regards rural districts only, in the following manner:—(*a*) To place a rural authority on the same footing as an urban one with regard to the adoption of the Act, and also (as in the case of an urban authority) to make the Local Government Board, instead of the County Council, the sanctioning authority in many matters. (*b*) To simplify the power of purchase of land, by giving to the rural district council the same power of purchase for cottages that a parish council already possesses, under the Local Government Act, 1894, for those purposes for which a parish council is empowered to buy land, subject, however, to this difference—that the preliminary inquiry shall be conducted by the Local Government Board instead of by the county council. The Bill also gives power to hire land compulsorily. (*c*) The Bill provides that the size of a cottage plot may be one acre (as in Ireland under the Labourers Acts), instead of being limited to half an acre; also that the local authority may usually borrow, for 50 years, for providing cottages. Power to complain of lack of cottages is given to parish councils, the medical officer of health, or four neighbouring householders. When land is provided cottages may be erected by and placed under the management of a parochial committee, if the rural authority so determine. Both in the principal Act and this Act, the phrase "lodging-houses for the working classes" includes houses or cottages.

The Museums Committee, at their meeting on Tuesday, decided to bring forward immediately an *ad interim* report recommending the removal of the Jermyn-street Geological Museum to South Kensington. They will also strongly recommend that the Science and Art Departments shall be housed on opposite sides of the way, instead of side by side. It is understood that the decision to issue an immediate report is due to certain rumours as to the intentions of the Office of Works with regard to the Science and Art collections.

The members of the Metropolitan Asylums Board reconsidered, on Saturday, a letter from the Local Government Board forwarding a copy of a report by the district auditor in connection with the audit for the half year ended Michaelmas last upon certain accounts of the Brook, South-Western, Park, and Grove Hospitals. The Local Government Board only sanctioned an expenditure of £200,000 in connection with the Brook Hospital, whereas the Asylums Board had spent £284,129, being an excess of £84,129. Moreover, the auditors had detected the facts that £38,000 worth of work was ordered by the architect on his own responsibility, without the sanction of the board or any committee, and that £50,000 had been paid to contractors in excess of their contract prices. The alterations and additions at the South-Western Hospital, contracted for at £26,976, had cost £30,879, and work involving a cost of upwards of £3,000 had been carried out on the order of the architect without any authority from the board. The letter was referred to the Finance Committee. Mr. Lobb moved: "That having regard to the fact that the total amount paid by the managers to architects and quantity surveyors during the last four years ended at Lady Day, 1897, was £63,683 9s. 7d., the question of the appointment of an architect to the board be referred to the General Purposes Committee for consideration and report." After some discussion, the managers voted upon the motion, the result being that the voting was equal—namely, 15 for and 15 against. The chairman then gave his casting vote against the motion, which was accordingly lost.

An exhibition of water-colour drawings was opened on Saturday in the Camphill Gallery of the Glasgow Corporation. It consists of the first circulating collection of works of water-colour artists of the British school selected from South Kensington Museum with the view of illustrating the rise, progress, and present position of the art. It embraces about 300 separate works, selected examples of the finest and most characteristic productions of the various pioneers of water-colour drawing, and of their successors, who have carried this branch of art to its highest perfection. Water-colour drawing, as now understood, may be said to belong exclusively to the 19th century. In earlier days water-colour pictures were really tinted drawings, hence the name drawing which obstinately adheres to water-colours. From 1800 onwards, under the influence of Girtin and Turner, the art became really painting. This and many more important points are well illustrated in the collection, which contains works in the earlier manner by George Barret, sen., R.A., Gainsborough, Paul Sandby, R.A., Isaac Cruikshank (the father of George), Thomas Hearne, John Robert Cozens, and Julius Cæsar Ibbetson, &c. The works of all the great early practitioners of the modern method of

water-colour painting are well illustrated, among the names known to fame being Girtin, Turner, Old Crome, John Sell Cotman, Italian Smith, Wm. Blake, Bonington, Varley, George Barret, jun., Wm. Henry Hunt, Cox, De Wint, &c. Among the recent exponents of water-colour painting, there are examples of Sir James D. Linton, Sir John Gilbert, Henry Moore, Rossetti, Randolph Caldecott, and many others. The collection will remain on view at Glasgow for the next three months.

A small collection of autographs and letters has been added to the galleries in Queen-street, Edinburgh, of the Scottish National Portrait Gallery. The most attractive are manuscripts by Robert Burns, which range from what is supposed to be the earliest specimen of his writing, to a letter addressed to Alexander Cunningham, written about a fortnight before the end, and, in character, from entries on Excise vouchers and notebooks to impassioned letters and some of his most famous verses. There are also letters written by Scott, Jeffrey, Lockhart, Macaulay, Campbell, "Tom Cringle" (Michael Scott), and Watson Gordon. There is also a selection of historical autographs, including those of all the Stuart sovereigns except Mary of Orange. Through an arrangement with the National Gallery of Scotland a number of portraits, including oil-paintings, miniatures, and medallions, have been transferred to the Scottish Portrait Gallery.

Memorial stones of a new Sunday-school in connection with Ventnor-street Methodist New Connexion Chapel, Kirkstall-road, Leeds, were laid on Saturday. Mr. W. S. Braithwaite, of Leeds, is the architect. The building will be of brick, with stone facings. There are two stories. The ground floor will be used as an assembly-room, the upper floor will provide a preaching-room and six class-rooms. The new school will accommodate about 350 scholars, and will cost £1,350.

The marriage of Mr. F. F. McKenzie, the superintendent of Epping Forest, and the son of the late Major McKenzie, to Miss Jane Moller Reid, daughter of the late Mr. John Reid, of Old Clock House, Enfield, was solemnised at the parish church, Enfield, on Wednesday in last week. The City Court of Common Council gave the bridegroom a handsome present from the pockets of the ratepayers on the day after the wedding by voting him an increase of salary from £500 to £600 a year.

The new Free Library and Art Gallery at Huddersfield were opened by the Marquis of Ripon on Friday. The premises, which are in Church-street, have been granted by Sir J. Ramsden for ten years at a nominal rental, and have been fitted up at a cost of £900, while another £700 has been expended on books. Till now Huddersfield has been almost the only corporate borough in the kingdom without a public library.

A new tramway line has been opened in Leeds this week. The route is from the Corn Exchange, along York-street and Beckett-street to the Cemetery, and thence to the junction of Harehills-road and Roundhay-road. Part of the line was formerly worked by the Thomson-Houston Company, but for some time it has not been used. The corporation have had to lay a new line from the corner of York-road, along Beckett-street, as far as Green-road, in order to connect the lines which were in existence, and make the system complete. A new route to Roundhay Park is thus opened up.

The City Corporation have adopted an arrangement for acquiring the freehold of Nos. 1 to 4, Cheapside, and 1A, Paternoster-row, for the sum of £22,542, in accordance with an award of Mr. Robert Vigers. This will allow of a substantial and much-needed widening at a very congested corner.

On Sunday Cardinal Logue laid the foundation-stone of a new Roman Catholic church at Tullyallen, which is only a short distance from the noble ruins of Mellifont. The new church, which, apart from its interior fittings, is to cost about £3,500, is to be in the same style of architecture as the neighbouring ruins, and is being erected from designs by Mr. W. H. Byrne, of Dublin.

A Local Government Board inquiry was held in the Town-hall, Newcastle, on Wednesday, to consider the application from the corporation for sanction to borrow £2,140 for public library purposes, and £60,000 for the extension of the City Lunatic Asylum.

The Roman Catholic Cathedral at Westminster is making steady progress. Mr. J. F. Bentley is the architect, and the builders are Messrs. Shillitoe and Son, of Bury St. Edmund's. £13,807 has already been spent, and a further sum of £22,573 will have been spent in six or seven months. What the total cost will be is not yet known, as the cathedral is being built by schedule.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Royal Institute of British Architects. Annual General Meeting. 8 p.m.
Surveyors' Institution. Discussion on "Tithe Rent Charge Recovery." 8 p.m.
Society of Arts. "The Electric Locomotive," Cantor Lecture No. 1, by Prof. Carus Wilson. 8 p.m.
Society of Engineers. Discussion on "The Protection of Underground Water Supplies," Royal United Service Institution. 7.30 p.m.
Liverpool Architectural Society. Annual Meeting. Closing Address by the President, W. E. Willmill, M.A.

Tuesday.—Society of Arts. "Senefelder and the Centenary of Lithography, 1798-1898," by Joseph Pennell. 8 p.m.

Wednesday.—Society of Arts. "The Revival of Hand-Loom Weaving," by Miss Clive-Bayley. 8 p.m.
Edinburgh Architectural Association. Annual Meeting and President's Valedictory Address. 8 p.m.
Edinburgh Architectural Society. "Evolution of the Modern House," by A. N. Paterson, M.A., of Glasgow. 8 p.m.

THE ARCHITECTURAL ASSOCIATION.

MAY 6th, ORDINARY MEETING, 9, Conduit-street, W., 7.30 p.m. Papers by Mr. W. ECKSTEIN, C.E., on "INTERIOR LIGHTING" Reflected Lights and Mr. TOM EKIN on "ELECTRIC LIGHTING AS APPLIED TO ARCHITECTURE"
Nominations of Officers for Session 1898-99.
MAY 7th, SPRING VISIT to the Crown Theatre, High-street, Peckham, Mr. Ernest A. Runtz, Architect. Meet at building 3 p.m. Frequent trains to Peckham Rye or Queen's-road Stations.
E. HOWLEY SIM } Hon. Secs.
G. B. CARVILL }

CHIPS.

In the case of Bennet Milward, Sutton, and Myddleton-road, Bowes Park, N., builder, the discharge from bankruptcy has been suspended for five years, ending March 29, 1903.

The foundation-stone of the clock-tower now in course of erection at the end of Queen-street, Exeter, was laid on Friday by Mrs. Miles, the donor. Mr. T. A. Andrews is the architect, and Mr. Easton the contractor. It is hoped to get the tower and clock completed by the end of July.

An inquiry was held at the parish-room, Lustleigh, on Tuesday morning by Colonel A. J. Hepper, D.S.O., R.E., an inspector from the Local Government Board, into an application by the Newton Abbot Rural District Council to borrow £1,000 for the provision of a water supply for Lustleigh.

The wooden island pier situated to the west of Blackfriars Bridge, on the Surrey side, is being demolished, and will soon vanish from the river. During the four years it has been in position it has served as the chief base of operations in connection with the construction of the Waterloo and City Railway. The earth and rubbish excavated in the subway have been removed from this point, and the material required for the work below has been lowered down temporary shaftings.

Sir Joseph Fayrer, F.R.S., has accepted the presidency of the 17th congress of the Sanitary Institute, to be held in Birmingham, commencing on Sept. 27th.

A building, which has been erected at the junction of Main and Lorne streets for the Club, Campbeltown, from designs by Mr. H. E. Clifford, Glasgow, was opened on Friday. The reading-room is on the first floor, and the billiard-room on the second floor.

While making some excavations in a garden in Grantham Grange some workmen struck stone, and digging deeper unearthed the base of a solid quatrefoil pillar, with Decorated moulding. The pillar, measuring 2ft. 4in. across, stands on a block of stone 6in. deep, which may either be a stylobate or a portion of a floor. The stone is a local formation, such as is now found at Ponton and Heydour. In pre-Reformation times a monastery stood in the Grange, but its position could never be exactly determined. Further excavations are to be made.

A conference of churchmen was held in Manchester on Friday, under the chairmanship of the bishop, to take steps to carry out the recommendations of his lordship's recent commission of inquiry into the spiritual needs of Manchester and Salford. According to the commission, £48,000 is needed to build sixteen churches, at a cost of £3,000 each, besides £20,000 for sites, and £12,000 for mission-rooms, together with £4,000 a year for clerical and lay help. A resolution was passed that an effort should be made to raise the needed money during the next five years. Before the meeting closed, it was announced that £24,600 had been promised to the object.

The Lanarkshire and Ayrshire Railway Company have let the contract for their new line from Giffnock to Giffen to Messrs. Robert M'Alpine and Sons, of Glasgow. The contract price is about £200,000, and the length of the line about fifteen miles. This firm has made the whole of the Lanarkshire and Ayrshire railways.

Trade News.

WAGES MOVEMENTS.

Aberdeen.—The recent decision of the Board of Conciliation in raising the standard rate of plasterlabourers' wages from 5d. to 5½d. per hour has been formally communicated to a meeting of the Master Plasterers' Association. The meeting expressed keen dissatisfaction with the decision, which was declared to be at variance with the evidence submitted.

Driffield.—The master bricklayers of Driffield have come to the men's terms, after a strike lasting a fortnight, and agreed to advance wages from 6d. to 7d. per hour. Most of the men have left the town, and obtained work elsewhere at higher wages still.

Maidstone.—The carpenters of this town, numbering about 130, have decided to come out on strike to-morrow (Saturday). The question in dispute between the men and their employers is that of overtime. For the first two hours after 6 o'clock p.m. the men, who aim at "scotching" overtime as far as possible, demand time and a quarter, while the masters offer an extra half-penny per hour and after 8 p.m. time and a half. The men are unwilling to accept the offer of the employers on account of the fact that practically all overtime is worked in the first two hours after 6 p.m. Negotiations have been broken off, both sides in the dispute being prepared to face the consequences of the threatened strike, which will probably affect the building trade generally.

Manchester.—A settlement has been arrived at with regard to the demands made by the local operative joiners upon the master builders of the district. At a general meeting of the Manchester and district joiners, held on Thursday in last week, at the Central Hall, Oldham-street, Mr. J. Stewart, chairman of the local committee, presiding, a report was given on the negotiations that had taken place between the committee and the master builders with regard to the alterations proposed by the men in the conditions of working for the district, and the terms submitted by the Manchester Master Builders' Association for a settlement of the questions at issue, were brought up for consideration. The employers' proposals were discussed, and although they scarcely came up to the demands of the men, they were regarded as very reasonable concessions. The chief points on which concessions were offered had reference to increased rates for the first two hours' overtime; increased "lodging" money for country jobs; and better allowances for time occupied by workmen walking to outside jobs. The meeting ultimately decided to accept the offers made by the employers for a settlement of the movement. The notices served by the men were timed to expire on the 30th inst., and in case a general strike had arisen, about 3,000 joiners would have been affected.

Newport, Mon.—Although negotiations are going on for a reference of the dispute between the Carpenters' and Joiners' Society at Newport and the Master Builders' Society to the Conciliation Board, the carpenters have decided to form a new society, to be called the Newport Carpenters' Co-operative Society, which will undertake to do work, the society being conducted upon co-operative lines. About 150 carpenters and joiners are idle, and other branches of the building trades are unable to go on with work for lack of joinery. The operative painters have asked for an advance in wages from 7d. to 8d. per hour. The employers have offered the paperhangers 7½d. per hour, refusing any advance to house painters; but the proposal has not been accepted.

Portsmouth.—The six months' notice served upon the Portsmouth Master Builders' Association in November last, asking for an advance in the wages paid to the bricklayers, plasterers, and painters employed in the town, as well as alterations in the working rules, &c., expires on Monday next. The plasterers, through the National Association of Operative Plasterers, are asking for an increase in wages from 8d. to 9d. per hour, with a nine-hours day, and a 50-hours week; the painters, through the Portsmouth branch of the Amalgamated Society of House Decorators and Painters, demand an advance in wages from 6½d. to 7d. per hour, and the constitution of a conciliation board; and the bricklayers are asking for an increase of wages from 8d. to 9d. per hour, and various alterations in the code of rules. The labourers' societies demanded, on behalf of their members, an increase of wages and a new code of rules; but they have offered to accept a compromise.

Swansea.—The six months' notice, which the masons gave the master builders whilst demanding an increase in wages of from 8d. to 9d. per hour, expires to-morrow (Saturday). The masters have decided to refuse the demand, and a strike will consequently take place.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2261.
FRIDAY, MAY 6, 1898.

BUILDING DANGERS.

DURING the last few months several fatal building disasters have taken place, some of them attended with serious loss of life. Two or three have been reported from America. One of these, at London, Ontario, we very recently described. A public meeting was being held in an upper floor, when it gave way under the weight and stamping of the people, and in its fall carried with it another floor, killing several and injuring many others. The cause of the failure was not satisfactorily determined; but there is little doubt that the beam at the end of the room which gave way was either unsound, or the pieces composing it were not securely bolted together. Soon afterwards we recorded a collapse of a new roof over another large assembly-room in Canada, which might have resulted in equally serious consequences.

The sad crane catastrophe at the Waverley Station, Edinburgh, which resulted in the death of three workmen and the injury of 15 others, is too recent to be forgotten. The failure and collapse of speculative builders' work is frequent in the Metropolis; but these failures often arise from inferior materials, bad mortar, and rapid building, and are amenable to stricter regulations and supervision. But what are we to say of the collapse of buildings in which well-considered construction and skilled supervision have been employed? When a building of superior construction gives way from a sudden fall of a floor or roof, and yields, in fact, under the weight of the sudden impact of its materials, we naturally ask what are the limits of the strength of the structure or of its component parts? When the fall of one floor causes the giving way of the other floors, as in the case of a house built with cards, there is a certain degree of unreliability that suggests a very small margin of strength. At the present time it is a remote inference to draw any conclusions between stability and safety and external appearance. Our external façades represent solidity and strength, there is nothing to suggest a thin wall or a weak floor in the details exposed to view—indeed, the art of disguising is so complete, what with casing our girders and iron columns, that it is impossible to say from external appearances whether a building is substantial or flimsy.

The serious catastrophe we reported last week of the collapse of a new building in Orchard-street, Westminster, through which seven lives were lost and several injured, is an example which we may well take to heart. Till the investigations of the experts commissioned by the Home Office have been concluded, and the report made public, it is premature to offer any opinion, though it is rather a difficult task for the most experienced to discover from so much fallen *débris* the cause of the disaster. If, as supposed, the catastrophe was caused by the collapse of the concrete roof by the removal of the supports before the concrete had proper time to set, no one can be blamed except those who may have given orders for the removal, or unauthorised removal. The circumstances, apart from the particular building or fault to be attached to anyone, are instructive. Many labourers engaged in this kind of work are ignorant of the nature of concrete, and we have heard of instances where the workmen have, on their own responsibility, taken away centres, believing the concrete or the arch, as the case may be, was properly set. The coroner intimated that the Building Act itself may be defective in permitting "a building to have been put up within the ordinary legal limits, and yet to collapse in the way this had done"; but the Act does not pretend to instruct builders or workmen in the operations of work as to striking centres, or as to the time to wait before concrete can set. It would indeed be well, and on the safe side, if the Act included a regulation requiring that no supports or "centres" should be removed before an examination by an official had been made. The building in question, which we illustrated on April 22, is a large and handsome corner building, "Abbey Mansions," for H.M. Office of Works, Victoria-street. It is of eight stories in height, and has been erected at a considerable cost. We understand there were a number of sub-contractors employed. When an accident befalls a building of this kind, we may well ask what buildings can be pronounced free from danger, under certain conditions. There have been other cases of the fall of one floor carrying with it the lower ones—a fact which makes it more incumbent upon builders or foremen to use the greatest caution in the supervision of those engaged in the upper portion of a building. Have we not heard of heavy iron roofs collapsing and carrying with them the floors below, owing to a want of care in screwing up the nuts at the ends of tie-rods, while the whole weight might have been safely carried by timbering or shores transmitting it to the floor or walls below? The suddenness of the impact, or the measured tread or stampede of a crowd, adds immensely to the destructive effect of the load. The conditions of modern building in towns call for more than ordinary precautions. Owing to the rapidity with which buildings are run up, the vicissitudes of contracting, the use of green materials and bad mortar, the complication of new building expedients, faulty ironwork, and other causes, new buildings are quite as much, if not more, liable to accidents as old and dilapidated structures, for which the Dangerous and Neglected Structures provisions of the London Building Act have been framed. It is needless to recall the number of "jerry" buildings, the walls of which, through inferior and green materials, have given way without timely warning, or the defective iron girders and columns which collapse and cause fatal injuries. These are some of the contingencies to which new buildings are exposed, and which demand more careful supervision by the local authorities.

ARCHITECTURE AT THE ROYAL ACADEMY.—II.

THERE is always something inscrutable about the selection year by year of drawings for the Architectural room of the Royal Academy, and the exhibition consequently is, as usual, replete in surprises. For example, one exhibitor, Mr. Baillie Scott, last year sent several very original studies, but they were all rejected. He sends the same subjects this year, and they are hung. This is by no means uncommon. Indeed, many of the most interesting exhibits of 1898 were refused in 1897. Another of the most curious features about the collection this year is the preference which the hanging committee has accorded to small projects and mere designs, the choice of which has resulted in a fringe of inconsequential frames disposed below larger drawings along the top of the skirting, patchworked in where they best might be made to fit—puzzle-wise. Some of these trifling oddities, too, appear to have gained selection mainly on account of their indescribable queerness in draughtsmanship: witness Nos. 1630 and 1636—two frames in body colour of fancy designs for "An Artist's House," by Mr. A. H. Skipworth. If these two schemes were worth showing at all, surely the author should have been expected to set them forth in a more workmanlike way. Mr. C. R. Ashbee is another artist who revels in the ecstasy of eccentricity, and so in 1683, Wombourne, Wodehouse, Wolverhampton, we not only have a triplet of W's, but a strangely uncouth façade baldly delineated, in a weak weary way, with an outline block plan awkwardly contrived on the sheet to fit in flag-like form over the gablet in the centre of the composition. The design is for a house, seemingly, displayed with shaped gables and windows so high up in the dormers as to finish inside hard up against the soffit of the rafters. Emancipated from ordinary considerations, the proposal as here feebly shown, looks amateurish to a degree, and it is not pretty either. Its faults are cultured, however, and the drawing may possibly serve as a corrective to the over-elaboration of professional draughtsmanship. This, perhaps, was the reason for hanging this elevation. But we can conceive no possible good derivable from the inclusion of such an extraordinary exhibit as No. 1657, Town's Green Memorial Cross and Drinking Fountain, Chorley, by L. Rycroft Oakes. One more example of this foolishness of selection. Let any impartial and qualified architect look at No. 1596, an outline proposal for a new church at Barnoldwick, by Messrs. Bromet and Thorman. Observe the west window, the buttresses, the turrets of the tower, and the arches which span the intervening spaces! If the members of the hanging committee who thought this worthy of the space they gave it care to know what we do consider deserving of a position in the Academy as a church design, we have no hesitation in naming one. It shall be the proposal for a South London Church, by Mr. C. A. Nicholson (Nos. 1696 and 1700), to be built on a triangular site. The scheme is unusual, with two naves, and an aisle wedged in between. The choir is cut off boldly from the body of the church, and the pulpit is located next the central pier at the end of the aforementioned aisle. German fashion, there is a second altar at the "west" end of the church, and this altar faces the pulpit. Outside, the walls are of brick; inside the arcade in plaster, unrelieved by mouldings, and springing from plainly-built stone piers. The choir organ is situated in a sort of triforium at the east end of one nave. The whole thing is uncommon and unconventional to a degree. We should be glad to see it built.

The late Mr. Scott, of Brighton, was the architect of a big barn of a church in stock brick, which was erected about thirty years since on a site near the Lewes Road by the Rev. Arthur Wagner, the vicar of St. Paul's in West-street. The building, which is of vast height, was dedicated to St. Bartholomew. Mr. H. Wilson has now made a design for a baldacchino, and he is, it would seem, rearranging the chancel. We have no doubt whatever but that he is doing this with good taste; but no one can really tell exactly how it is being accomplished if they only have the vastly-too-big charcoal drawing shown this year (1711) at the Academy to go by. The drawing is hung out of the centre of the gallery, and being placed high on the wall, heavy dark mass that it is, the effect is disconcerting and crushing in scale. The ordinary exhibits displayed anywhere near it are spoiled by its selfish weight. It is not necessary in condemning the size and shimmer of this cartoon to imply that Mr. H. Wilson's designs are not admirable—indeed, one has only to examine his bronze and enamel "Tabernacle" (1949) in the lecture-theatre among the sculptures, to judge how thoroughly clever Mr. Wilson is; but we consider it an injustice to others that so much room should be given to a

comparatively unimportant performance deliberately set forth in this scenic and sensational fashion, at once vague and ineffective, as a study of architecture, its attraction being mainly due to its inordinate scale.

Mr. J. J. Stevenson, hitherto unknown as an ecclesiastical architect, sends a flatly-handled water-colour, of somewhat pleasing simplicity, of a Free Church at Kelvin, Glasgow. The perspective looks more like a developed elevation. The tower has a regular Scotch crown spire of buttresses after the types at Old St. Machar's, Aberdeen, and St. Giles', Edinburgh. The traceried windows seem studied on old national churches, with the historic touch of Flamboyant design introduced. St. Patrick's Church, Dundee, with Presbytery, by Mr. T. Martin Cappon, is much more free in treatment, with a squat belfry stage to the square-built tower, an octagonal lantern appearing above as a crowning feature executed in timber. Another Roman Catholic church deserving of special notice is St. Augustine's at Nottingham, by Mr. Arthur Marshall (1669), designed in brick, very cleverly contrived for a restricted site at the corner of two streets, a great feature being made of some flying buttresses over a narrow aisle. Between there are big traceried windows. The lead flat roof over the aisle is a questionable device, however. Mr. Charles E. Ponting is represented by a small hillside church dedicated to St. John the Divine at Ford, Wilts, very picturesquely delineated, with some cottages and an old bridge in the foregrounnd (1686), an interior (1652) being given to show what effective work can be done in good taste with limited means. Mr. A. Skipwerth shows a curious design for a rood-screen at All Saints, Fulham, in a German-like Gothic style, with a cambered beam surmounted by a range of candlesticks. The traceries below look wiry and thin; but this exhibitor always shows a degree of freshness which we welcome, even if we cannot always admire his conceits. One of these is the incorporation of a pulpit in a screen for Udimore Church, Sussex (1776), where, to make the balance of the composition true, a sort of cupboard inclosure is contrived on the south side of the screen. Had a loft over the screen been included, a stairway might have justified the treatment, but at present the effect is meaningless, and in the drawing the design looks very like a fireplace. Mr. James Brooks has made far more worthy designs than St. Luke's, Enfield (1716), with its somewhat regulation type of tower and thin-timbered treated gables to the quasi-transepts. When we judge this veteran's designs we remember his East-end churches, which have never in their way been surpassed, so that we miss the sweetness of good proportion in looking at the shape of the lancet fenestration at the end of this one. Mr. J. O. Scott sends the richly managed tower of St. Mark's, Harrogate (1719), worked out in correct accord with traditional spirit. Another tower of massive proportions is Mr. W. D. Caröe's design for St. Michael's, Woolwich (1706). Mr. Percy G. Stone exhibits a section showing the new timber roof and screen for St. Peter's church, Sherwell, Isle of Wight, at once suitable and inspired by a close study of local Mediæval work (1737). The marginal drawings illustrate this architect's love of Gothic grotesque in carvings. They are here depicted with feeling and ability. Messrs. Clark and Mescrop are represented by St. Luke's Church, Darlington (1803), a pleasant-looking group of buildings; and Messrs. Rogers, Bone, and Coles evince a quaintness by an Arts and Crafts manner in designing the choir fittings for St. Brelade's Church, Jersey (1661), which are fashioned in a sort of domestic way not surely out of place, however, in a country church. St. Luke's Chapel, West Hampstead (1655), by Mr. Basil Champneys, is the subject of an unambitious drawing, showing, of course, good work; but this architect does himself an injustice by exhibiting such a weakly-executed elevation (1757) of the Robinson Memorial Tower at New College, Oxford. The Higher Grade School, Scarborough, by Messrs. Hall, Cooper, and Davis, is picturesque enough, and deserved a better place on the walls (1754).

Turning now to some of the street architecture shown in the exhibition, we may briefly record some notes which figure in our copy of the catalogue, and not before transcribed. The first is Mr. J. M. Brydon's Art Galleries at Bath, a work quite in harmony with the old vernacular Classic of that city (1625). Mr. Walter Cave's small green brick front, 40, James-street, S.W. (1634), has a pleasing plaster bay and a stone gable—a nice notion neatly carried out. Mr. Ernest Newton's street row of buildings—including a bank, an hotel, and some shops at Bromley (1638), has the advantage of good drawing, and illustrates a capability on the part of the architect which is beyond question. The bank, however, hardly bespeaks itself, and the ground-floor front looks more like a place for light refreshments or perhaps the well-lighted hall of a private house. The shop-front adjoining is very ordinary. The George and Dragon Inn, Castleton (1667), is a characteristic minor work, the production of Mr. Edgar Wood. Another roadside inn of good style is one at Bromford (1684), by Mr. H. T. Buckland. The Public Baths at Bethnal Green (1703), by Mr. R. Stephen Ayling were won in competition, and well deserved their choice. Messrs. Bateman and Bateman send a competition design for Bury Free Library (1717), and Mr. Sidney Smith shows a large red house in Green-street, Park-lane (1726). The Public Library at Shoreditch, by Mr. H. T. Hare (1728), is one of the most satisfactory buildings of its class in the exhibition, skilfully conceived, and well worked out. Mr. Davison's drawing does it justice too. The Bank, Blyth, Northumberland, by Messrs. Armstrong and Knowles, hangs near (1732), and close by is a florid gable designed for Clerkenwell Town Hall, of which Mr. C. E. Vaughan was the architect (1753.)

The rebuilding of Gosling's Bank, Fleet-street, by Mr. Arthur C. Blomfield, will make an important addition to the architecture of Fleet-street (1750), and we herewith illustrate Mr. Paul's capable perspective by which the façade is represented at the Academy. The plan is contrived with every regard to the purpose of the building, and the exterior is at once dignified and refined. Mr. Field has an important block of General Office buildings for the North Eastern Railway Company at York, of which an admirable view is given by 1780. The whole group is spiritedly picturesque with ample windows, and a business-like air about it, showing what can be done to inspire commercial premises with rather more than a degree of interest.

Turning, in conclusion, to some of the hitherto unmentioned country houses, we note a red-brick Classic mansion by Mr. Reginald Blomfield at Medmenham, rather carelessly drawn, with windows out of the upright (1786), but like all this gentleman's work, somewhat dashing in style. (We cannot pass on without giving warm praise to his design, hanging near his other exhibit, for the Processional Crucifix for St. Paul's Cathedral. It is a very capable and well-studied proposal.) The Cottage Homes at Mill Hill (illustrated by us this week) for the Linen and Woollen Drapers' Institution, by Mr. Geo. Hornblower, are shown (1796) in a crisply-executed bird's-eye view, to be a pleasingly grouped set of comfortable buildings. "Cliff Towers," a Colonial home designed by Mr. Harrison Townsend (1771), is seemingly a shingled dwelling, cleverly treated. Mr. C. F. A. Voysey has two of his smaller houses—one in Surrey and another in Hampshire (1758, 1759), represented by the skilful brush of Mr. Howard Gye. Both residences are in plastered walling, ingeniously contrived in a thoroughly country-side way, homelike and quaint. Higheombe Edge, Hindhead, by Mr. William A. Pite, has some uncommonly good interior woodwork about it, and the sketches in the hall (1730) are, therefore, interesting. The Old White House, Oxford, by Mr. H. T. Hare, we notice with satisfaction (1725), and hanging close to it are some views in pastel, by Mr. Rickards, of Mr. Leonard Stokes' ingeniously-designed House at Pangbourne, overlooking the river (1720 to 1724). The picture gallery, as well as the exteriors, show much ability. Houghton Grange, near Huntingdon, is by Mr. J. Ransome, and Mr. F. S. Taylor has a Waterside Hotel from the Isle of Wight, both worth naming (1695 and 1693). The Red House, Ayr, by Mr. J. A. Morris, is seen in a good pen view with large bays to the mansion overlooking some formal gardens suitably managed (1692). Braham, near Perth, is another Scotch house. The architect is Mr. F. W. Bedford, and his work is of stirling character (1680). The same unambitious merit is observable in "The Court House," Broadway, Worcestershire, by Messrs. Guy Dawber and Whitwell (1677), who have worked their designs entirely in accord with the old stone buildings of that county. Mr. J. H. Smith has a timber house of pleasing character, called "Summerdale," Epsom (1665), not long since illustrated in our pages. Mr. Alex Cullen sends the staircase of "The Ross," Hamilton, N.B. (1662), designed in a Jacobean style at home in Scotland. Rotherfield Hall, by Mr. Inigo Thomas, should be noted (1649) for quaintness tastefully thought out, and the same praise is due to Messrs. Bateman's plastered house at Edgbaston (1644), with the red brick chimneys. Mr. Halsey Ricardo is very restrained in his conceptions of fitness. The rigid severity of his house at Bramley is simplicity itself (1640). Mr. E. Newton is also commendably plain in his brick house at Wokingham (1637), which is cleverly drawn in colour, a little overdone in finish. Mr. Collcutt's own house, "The Croft," Totteridge, we are glad to see hung (1615), as it well merits a place on the line. We illustrated this view, and the garden front also, on August 14th, 1896. Mr. Ernest Runtz has a clever little house (1612) at Sutton, which we shall soon illustrate, and Mr. E. J. May shows some good sketches by the same hand of some capable additions to an ungainly old house, Jardine Hall, Dumfries.

PICTURES AT THE ROYAL ACADEMY.

[SECOND NOTICE.]

ONE of the most charming landscapes in the first gallery is Gilbert Foster's "Whispering Eve" (21), a landscape or hillside under widespreading trees, the grass slope covered with daffodils. We have seen nothing better of this painter's work. There is a delightful atmosphere as one sees in spring: deep recesses of woodland lend beauty and mystery to the scene, fading into a blue hilly distance beyond. A grand seascape by Edmund G. Fuller, "A Fair Wind" (11), is a fine stretch of blue sea; the reflection of the sky is well painted. We have spoken of H. W. B. Davis's large sunny picture, "A June Evening," the apple-blossom and cattle in which are rendered with his consummate skill. Last week we briefly noticed Briton Riviere's great work, "The Temptation in the Wilderness" (22), a grand solitude. The painter has impressed the spectator with the majesty of this desolate mountain summit, upon which sits, with bowed head, the white-robed Man of

Sorrows. The undulating surface of the vast rocky plateau resembles a dark tumultuous sea, the bright horizon being reflected on it. H. H. La Thangue's "Night-fall," an old peasant woman and her daughter making their way homeward through a narrow path with their gleanings in the pale moonlight, is a fine piece of realism with a certain pathetic interest. The grouping of the bending figures and the colour in his "Bracken" (123) in the next gallery—an old woman who leads the way laden with bracken, followed by another younger woman, in a warm evening sunlight—are also admirable. "Good-bye, Holland," a group of Dutch fisherfolk on the beach waving their farewells to a small sailing vessel that is leaving the shore, is charming in colour, and pathetic. Passing a few good pictures by Norman Garstin, Alfred Parsons, Horace H. Cauty, and a few others, we come to J. W. Waterhouse's very graceful and somewhat Mediæval conception of "Flora and the Zephyrs" (64), a further examination of which confirms our first impression of its merit. The scene is laid in a garden or mead. From the foliage of trees the zephyrs are ministering to the goddess, who is seated. One places a white-rose garland round Flora; other nymph-like figures, clad in thin draperies, are picking wild roses and anemones. The goddess herself is robed in a figured dress of violet hue—all in pleasing harmony with the grass and flowers. The painting "Ariadne," in the Third Gallery, may be compared to it in surroundings, grace of figure, and melodious colour. The beloved of Theseus reclines asleep on a couch in a walled-in garden, her scarlet drapery, or peplos, open at the bosom; underneath the couch a panther is asleep, and another is just crouching to him. The harbour and galleon and sunset cliffs make up a pleasing composition. The conception is certainly poetical, the colour of tertiary hues soft and harmonious. But to pass to J. C. Hook's "Idlers," a delicious piece of coast scenery, a limpid and fresh sea breaking upon a sandy beach; a distant headland is seen on the left. The title is given to the least-prominent object—the idlers on the shore.

"Unconverted" (76), by F. D. Millet, is, as usual with the painter, a subject of quiet humour. The picture is a softly-lighted interior of a country inn, in which, near a table, a black-dressed young Puritan preacher with Bible in hand, wearing a large collar, stands. He turns his head disdainfully to a couple of maids who are engaged in peeling apples, one of whom offers him an apple smilingly. Seated on the table another customer is laughing quietly at the joke. The solemn demeanour of the young evangelist, and his contemptuous look at the girls who are offering him an apple, is amusing, and is painted in that pleasing cool tone of colour that we usually see in Mr. Millet's work. Alfred Waterhouse, R.A., sends a clever picture of "Arisaig, N.B." Seymour Lucas has a charming piece of colour in his "Phyllis is my only Joy," a lady at piano, a gentleman accompanying her on the mandolin, against tapestry background. Our passing notice of Mr. Abbey's great picture "King Lear" was brief and imperfect; we now, in a little more detail, examine the composition. Mr. Abbey's brilliant pictures from Shakespeare, his "Richard III." and "Hamlet," are already well known; this one of "King Lear" is a worthy successor. The subject is taken from the first Act, where the fair and portionless Cordelia is accepted by the King of France, who is reverently kissing her hand. She is about to depart. She is taking farewell of her scornful sisters, and speaks those words, half in reproof, half in irony—

> "Ye jewels of our father, with washed eyes
> Cordelia leaves you."

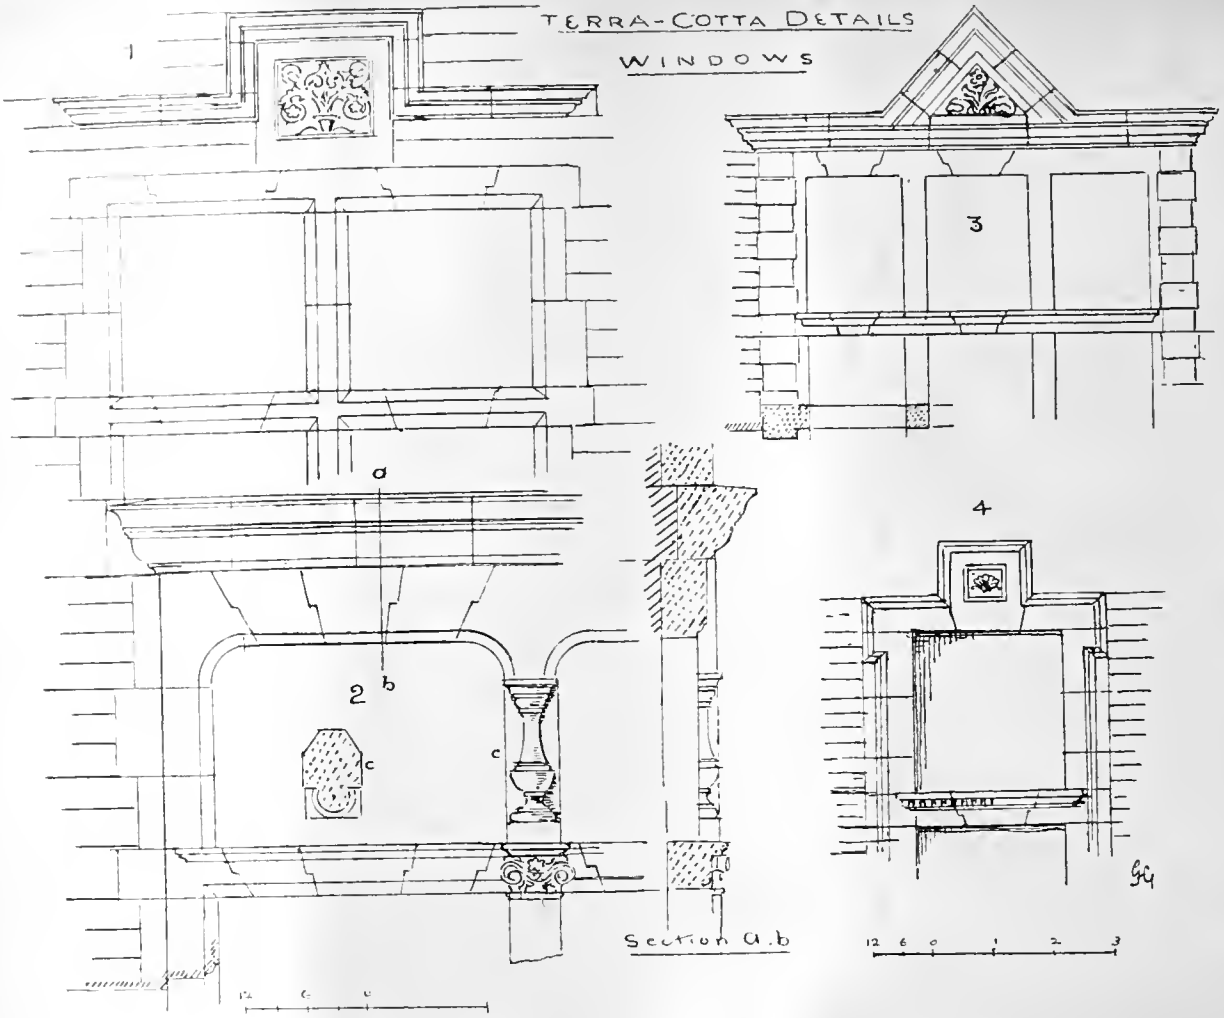
They stand reproved, but take the words in scorn. One, in a crimson robe, rises from her seat and half-mockingly raises her skirt with both hands. There is a suppressed smile on her face; the other sister, more demure, dressed in black, draws her robe close round her; but the central and most beautiful figure is that of Cordelia, in pale lemon drapery, her fair plaited hair falling over it. She turns in sweet reproof to her sister, her left-hand she permits her Royal lover, to kiss. On the right hand side the old King and Court are leaving; the King, in white robe and long white locks, shambles away, with the fool at his side, followed by his faithful dog. There is something very pathetic in this farewell of Cordelia, and Mr. Abbey has painted the scene with much majesty, and without any stagy effect. The poet, rather than the mere dramatist, has been studied. There is a sweetness in the look of the central fair figure of Cordelia to which all else is subordinated; the young French King wearing his crown forms one of the background figures, and the two other sisters are in rich but subdued tones. A barbaric splendour pervades the surroundings, especially on the retreating procession followed by King Lear. The costumes and colours are rich and harmonious. Frederic S. Richardson's "Katwijk Dunes" is a delightful piece of colour, a sea-shore, fresh and full of atmosphere and light. Mr. Frederick Goodall's picture, "A Gilded Cage" (167), a seraglio or divan, in which a lady in orange skirt reclines on a cushioned seat, and is about to relieve the tedium of her existence by a pipe which is being lighted by a slave boy, while a dusky attendant is bringing in a tray of liqueur or dainties, is somewhat hard.

In the next Gallery, III., Hubert Herkomer's large upright canvas "The Guards' Cheer: Crimean Veterans of the Guards cheering her Majesty during the Jubilee Procession," has a popular interest, and the painter has achieved a higher success in this than in his other portrait subject. As a background to the old Guards in scarlet uniforms is the Guards' Memorial, a monument whose bronzy darkness forms an admirable foil to the scarlet; but there is a mobility of feature in the faces and lips of the old men as they raise the cheer, and a variety of expression that is almost touching. The grouping and colour are strong and happily harmonised.

The President's "Duchess of Somerset," in a dress as Lady Jane Seymour (179), which the duchess wore at the recent Devonshire House ball, is Holbeinesque in beauty and accuracy of costume. The splendid jewelled dress of brocaded silk and of golden hue, the jewelled coif, the pendant, rich in pearls and rubies, and the jewel-bedecked skirt and head-dress, make a very rich and historical portrait. The President's subject picture, "The Skirt Dance," is another version of a similar theme we have seen before. A closer examination only makes more evident the technical skill of the painter of the Classic interior, the translucent marble, and the splendour of Classical draperies and flowers. The dance which the girl is performing is what is known as the "Ionic Movement"; but the work is academical, lacking in human interest. With all its beauty of drawing and technique, there is something unsympathetic, and a little hard and unyielding. The very exquisiteness of the many-coloured marble floor, and the finish of the accessories make it almost impossible to expect any feeling. The sitting maidens look on and chat unconcerned at the graceful movement of the *danseuse* before them.

We glanced at the splendid landscape of B. W. Leader, "In a Welsh Valley," and "Where Peaceful Waters Glide" (309), and "The Silver Sea" in the next Gallery, which alone entitle him to the honour he has lately won in the Academy. We see the perfection of finished landscape, serene calmness, unclouded skies, translucent water or rippled sea reflecting the beauty of hill and sky. A golden sunlight gilds the hill-tops of the Welsh mountains in the first, while in the last named a cool, silvery light pervades the atmosphere. The realisation of nature is in the hands of Mr. Leader only to be attained by great care and finish; but we never find his work suffer, as in many cases it does, by this kind of regard for detail: breadth and effect are seldom lost.

G. H. Boughton's chief work, "The Road to Camelot," briefly noticed already, does not give us the impression of a mirrored image of the passing world outside. There is little suggestive of the magic mirror, or of the romantic and tragical circumstances recorded in "The Lady of Shalott," but the scene is bright. We pass on to notice W. Q. Orchardson's delicate and fascinating portrait of "Miss Fairfax Rhodes." The lady is in a pale blue or grey dress, and has a pleasing and expressive face, but the light scheme of colour, like a delicate sketch, is the chief merit. His portrait of the Rt. Hon. Viscount Peel (330), a study of side face, is characteristic of the sitter, whose closed eyes and expression indicate a mental reserve. The painter has obviously observed his subject through a Parliamentary debate; it is not a portrait of repose—rather of one suitable to go with others of illustrious Speakers. In his subject portrait "Trouble" we can add little to our former description. What the trouble is is not clear; perhaps the young lady in evening dress, who is turning round to look at the dejected lover or husband, is the cause. At all events, we admire the elegance of the figure, the "Empire" drawing-room, its warm flood of golden hue. The subject is not so great a success as his former, "A Rift within the Lute." Andrew C. Gow's "A Gentleman of the Road" is a cleverly told incident. On the distant roadway, on a bleak and desolate heath or common, a coach and its occupants have been waylaid; a scarlet-coated individual is being attended to by his companions, while on the road lie scattered a number of letters. The mail-coach has been stopped and plundered, and the masked highwayman on horseback is beating a retreat, making a short cut across the common. Near it Ernest Crofts sends one of his historical pictures, "Charles II. at Whiteladies after the Battle of Worcester." The King and his retinue are shown making a halt in the courtyard of a large hall, after their defeat by Cromwell at Worcester. Mr. Crofts has lost none of his vivacity of touch, romantic air, or scholarly precision of detail. The two coast scenes by J. C. Hook, which hang on each side of Frank Dicksee's rich Renaissance study of lovers, are not quite so interesting. "Trouble with the Muzzle-loader" is the somewhat irrelevant title of a rocky creek, painted with Mr. Hook's inimitable skill as a delineator of coast, in the foreground of which a man is examining his gun. A number of rabbits lie before him on the grassy bank, and his dog. No. 278 is a more pleasant coast view, a distant line of cliffs forming a bay with the foreground, with a fresh breezy sea, and anchored boats on the beach. In Marcus Stone's "A Welcome Footstep" we have one of the well-known garden scenes, a white-frocked young maiden at her worktable with ribbons and wool, while beyond is seen the figure of her lover just coming through a wicket gate. As a pretty piece of sentiment, this picture hardly ranks with other subjects by the painter. It is a little stale; but it is a profitable subject for engravers. Val C. Prinsep's picture, "A Student of Necromancy" (283), has a deeper meaning. A darkened chamber in which a sombre-robed student is examining a ball of crystal. On a stool burns a flame from a basin. On a richly-carved coffer or sideboard which forms the background is a skull, and a



bookstand on which is a large volume of occult science. There is an air of mystery in the conception, and the solid painting contrasts with other everyday subjects.

G. F. Watts sends only one composition, and this a large upright allegorical picture "Love Triumphant" (310). Love is represented as a winged youth, with outstretched arms extended to heaven, standing on a rocky summit. On each side of his feet lie the dead bodies of Time and Death. The composition is majestic and powerful as an ideal conception, and may be compared in its handling and richness of colour to "Love and Death." Over it a light and brilliant decorative picture is hung, by T. Austen Brown, "La Benediction de la Mer: à Etaples"—a procession, with banners, of young girls in white, trimmed with blue, wearing wreaths of flowers, by the sea. A bishop in crimson cassock, wearing his mitre and holding his crosier, is giving his benediction, while beside him stands the cross-bearer. The key of the colour is in marked contrast with Mr. Watts's visionary picture.

Herbert A. Oliver's "In Fields Elysian" (305) is a poetical conception of "blinded Death" scythe in hand, stealing about in a field covered with scarlet poppies; a picture showing undoubted power. Another very noble and harmonious portrait by W. Q. Orchardson is "Mrs. Pattison," an elderly lady in black, seated in a red chair. Alfred Parsons' large landscape "The Mooters, Bishopswood, Herefordshire," and one of the best in the Academy, is a grand subject, masterful in its handling and colour. On a hill-top men are busy burning wood, and uprooted trees lie on the brow. Beyond, a distant prospect opens to view before the spectator. Byam Shaw's eccentric allegory, "Truth," is a conception of the same class which he gave us a year or two ago, and illustrates the verse—

> "Of Truth doth here this truth appeare,
> Withouten al disgyse,
> How men do stryve wych are y-lyve
> To shutte her from their eyes."

There is a quaint Mediæval symbolism in this work. "Truth" is a blindfolded nude maiden in the presence of a king and his court. Behind, three ladies are holding up a green velvet drapery as if to conceal her figure, while in front is a large bowl filled with a thick scarlet liquid like blood, in which a jester is dipping a white linen cloth. Other figures crowd the canvas, their eyes turned away from the central figure of Truth. The moral is clear. The innocent and truthful maiden is to be clothed or disguised by a decorous garment. Stanhope A. Forbes's picture, "The Letter" (365), is a group of cottagers at their door at night-time. The country postman, laden with bags and parcels, stands to examine his letters. The candle-light illumines the faces of the group at the door, casting blue shadows, and it is this part of the picture which is so realistic, and recalls other work of the painter where artificial light is represented, as in his last year's "Christmas Eve."

MODEL SPECIFICATIONS.—XI.

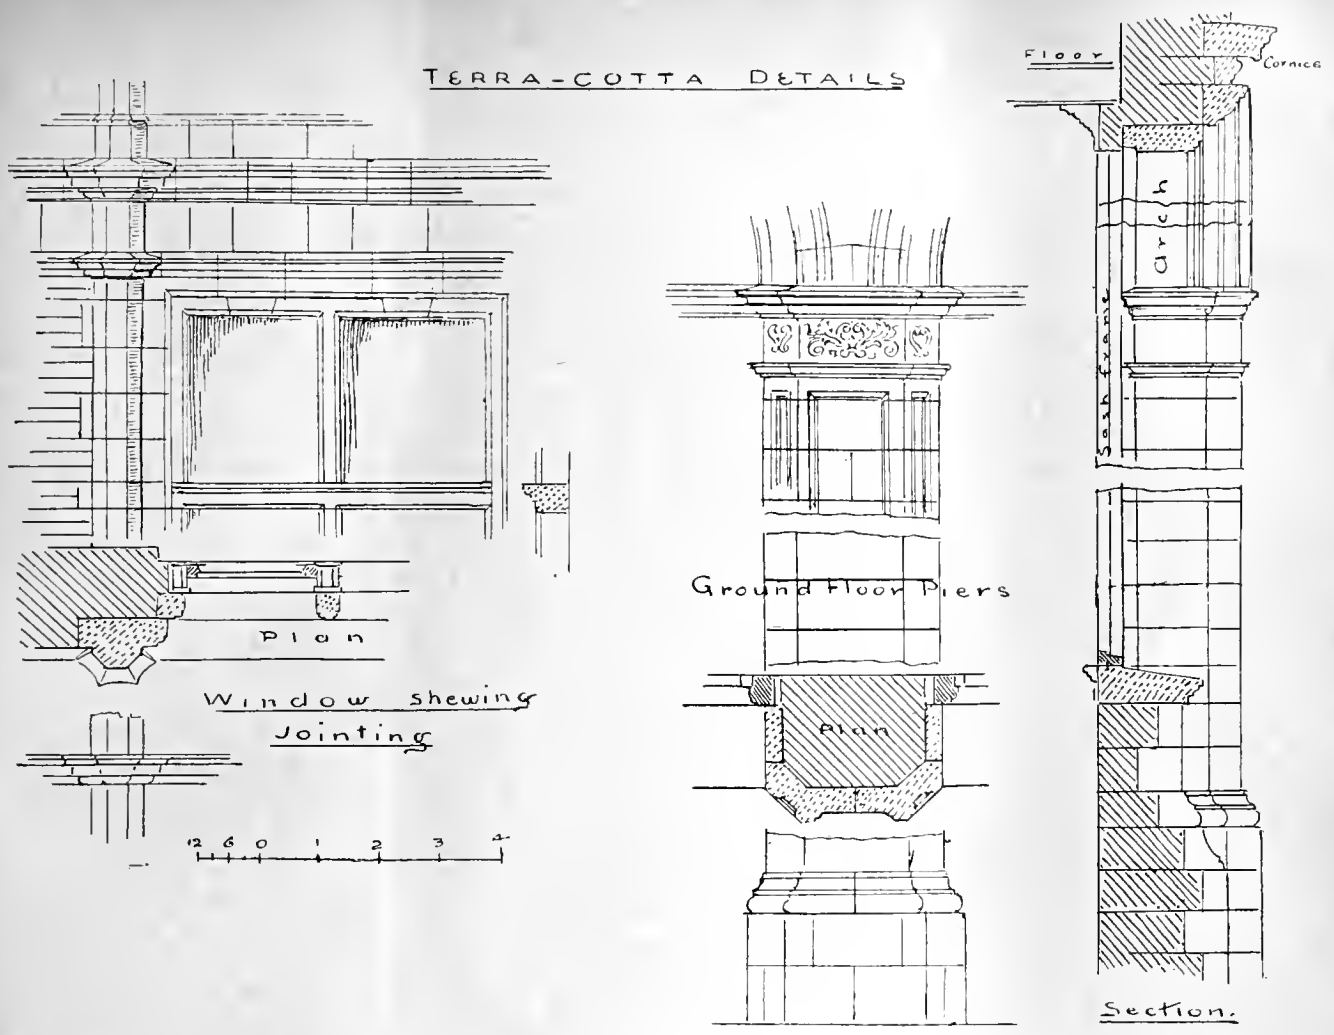
TERRACOTTA—(*continued*).

THE sizes of blocks and the jointing of terracotta work are important matters upon which the proper treatment of this material largely depends. The frequency of joints varies much in buildings. In some of them we find the blocks are comparatively large, in others small, and no doubt much of this difference depends on the clay and the degree of shrinkage in burning. We may give as examples of brick and terracotta work in London, the Prudential Offices, Holborn, and the Buildings in Carey-street; also the Natural History Museum, by Mr. Alfred Waterhouse, R.A., the blocks of offices in Arundel-street and Surrey-street, the recent corner block of offices and shops in Wellington-street, Strand, and offices, shops, and residences in Bond-street and Oxford-street. These are important and easily accessible buildings.

Other good examples of the employment of terracotta work may be found at the Northampton Institute, Clerkenwell, by Mr. E. W. Mountford, the Empire Theatre, Cambridge Circus, by Mr. T. C. Collcutt, and houses at Chelsea, Cadogan-square, and Collingham-gardens, by Messrs. Ernest George and Peto. These buildings will suffice to show the varying kinds of jointing and the sizes of the blocks employed. The Birmingham Law Courts, by Messrs. Aston Webb and E. Ingress Bell, the terracotta for which was supplied by J. C. Edwards, Ruabon, is a successful instance.

Our sketches are intended to illustrate different types of window-heads, in which the joints are joggled, and the mode of treating mullions and transoms. Fig. 2 shows a two-light window with centre mullion and transom. The head and transom have joggled pieces, and the jambs of window bond into and course with the brickwork. Figs. 3 and 4 are other examples. The details on the opposite page are taken from an executed building, and we give clauses to describe the work.

We here subjoin clauses for a front in terracotta that would be suitable to houses of the kind we see in Cadogan-square or other West-end suburbs, and in which an ornamental gable like that we gave in our last issue, p. 591, is introduced.



1. *Facings.*—The facing-blocks of terracotta are to be well-burnt red (or buff, of approved colour), and of tones approved by the architect (or uniform in colour), and to be supplied by Messrs. Doulton and Co. (or by J. C. Edwards, Ruabon), and where the blocks are large, are to be chambered, no part being less than 2in. thick. The hollows to be filled in solid with fine lime concrete, in the proportions described, the blocks being well soaked in water before filling. The courses of terracotta to be 9in. and 6in. (or 12in. and 9in.) in height or depth, to bond with the brick backing alternately, or as desired, and no piece to be longer than 18in. The original surfaces or edges of the pieces are to be left as they come from the kiln, and are on no account to be chipped or filed, unless the parts so treated are hidden.

The blocks to be set in fine mortar of approved proportions, neatly pointed with a bevelled joint as the work proceeds, no joint to exceed $\frac{3}{16}$in. ($\frac{1}{4}$in.) in thickness. The blocks are to be 4½ (or 6) and 9in. in thickness, to form a good bond with the brick backing. The whole facing to be cleaned down at completion, and all the horizontal and vertical arrises to be true and regular.

2. *Doorways.*—The jambs of entrance to have fluted pilasters (or mouldings) of terracotta in accordance with the detail drawing supplied, jointed as shown, or, if hollow, filled with fine concrete in the proportion of 1 part by measure of Portland (or Roman cement), 2 of sand, and 4 of fine clean ballast, the stones to pass through an inch ring. Each piece of terracotta to be thoroughly soaked with water before filling the hollow, and the pieces to be thoroughly bonded with the brickwork and flushed in with mortar. The base and capital (if any) are to be of the profile shown in full-size section, the arrises and mouldings to be true in line and regular when fixed, but no chipping or filing of the original surfaces or angles will be allowed. Or, the capitals of the pilasters or columns to be cast in one or two pieces, as shown, and to be filled in with concrete as described.

The arch mouldings to be in accordance with detail, and to be carefully set out before modelling with the assistance of the contractor (or clerk of works), the joints or voussoirs being as shown, with keystone according to detail supplied, (or selected from Doulton and Co.'s or J. C. Edwards's catalogue): and the ornamental spandrels or frieze to be No. — in J. C. Edwards' (or Doulton and Co.'s) catalogue, carefully modelled. The whole to be set in fine mortar, and pointed as the work proceeds, cleaned down at completion, and left to the architect's satisfaction (or to be set in mortar to match the facings).

3. *Bay Windows.*—The bay windows to be constructed of terracotta according to working drawings; the mullions and transoms to be 4½in. by 6in. (or 6in. by 9in.), jointed as shown; the lintels, heads, and transoms to have radiating or joggled joints. The entablatures or cornices to be of hollow blocks not longer than 12in., and to be jointed, as shown, with close, neat joints; the mouldings to be true in line, and no piece to be chipped or rubbed, the whole to be set in fine cement (or mortar) coloured to match the facing, and to be neatly pointed with joints not to exceed $\frac{1}{4}$in. in thickness. Carefully clean up, and straighten the terracotta where next to the joinery.

4. *Other Windows.*—The other windows to be executed with terracotta architraves or jamb mouldings, bonded into brickwork and mullions, with cornices and pedimental heads as shown in details (see sketches, p. 590, and those here give 1, 2, 3, and 4, or on opposite page), and in all respects according to previous description.

5. *Ornamental Panels.*—The ornamental panels (if any) below the ground-floor windows, in the pediments or above heads, to be modelled according to the drawing and to the architect's satisfaction, and to be cast in blocks of not greater size than shown or directed (or the ornamental panels to be those No. — in J. C. Edwards's Catalogue of Patterns or figured in Doulton and Co.'s "Architectural Terracotta"), and the pieces to be well bonded with brickwork and flushed in with mortar.

6. *Cornice, &c.*—The main cornice and frieze (if any) to be of well-burnt hollow blocks of terracotta in one or two courses 12in., 9in. high and 9in. and 6in. deep, and not more than 15in. long, to be well tailed or pinned into brickwork. The cornice is not to project more than 9in. (or 12in.) from the face of wall, and to be jointed as shown in detail, set in fine mortar or cement, and covered (if necessary) with two courses of tiles in cement, breaking joint. The frieze to be carefully and artistically moulded, and be left clean and sharp, and to be done to the satisfaction of the architect. All the arrises and mouldings to be left in true line and sharp.

7. *Gable.*—The gable to be executed in terracotta with plain facings, as described above, and with piers or pilasters at distances apart as shown (see sketch p. 591), and of a width of 9in. (or 6in.), and of 4½in. (or 2¼in.) in projection. The whole to be set in fine mortar and weather pointed as the work proceeds. The caps to be cast to design (or to be Doulton and Co.'s pattern). The finials or terminals to be according to detail (or of Doulton and Co.'s, Fig. —) securely fixed on copper rods in cement. The curved ramps or copings to be set out with joints, as shown in drawings, not more than 6in. (or 9in.) apart, with voluted ends set in cement, dowelled at the joints where necessary. The window-heads, moulded strings, and modelled ornament to be neatly executed according to drawings and to the architect's satisfaction (or the ornament to be selected from the catalogues of well-known firms), and to be clean and sharp, and the curved mouldings and arrises to be true in line and sharp. Any damaged or warped piece is to be removed and replaced by a perfect piece at the contractor's expense. The whole work to be cleaned down at completion.

The following clauses are suitable to describe a front to a bank or commercial building, the details of which are given in our sketches.

The manufacturer will be held responsible for the prompt delivery of the terracotta by the time it is required. Any damage is to be made good by the manufacturer (or contractor).

8. *Generally.*—The terracotta work to be well burnt red (or stone colour) of even tint, and free from cracks and other defects, and to be executed in accordance with the detail drawings, no piece of terracotta to exceed 18in. cube (or be larger on face than 12in. by 9in.) The surfaces are not to be coloured, nor to be filed, chipped, or rubbed, to remove the skin. The work, especially the moulded parts, arches, &c., to be set out by the manufacturer with the assistance of the contractor, who is to supply the necessary accommodation. Any damaged or imperfect piece is to be replaced at the expense of the contractor. The terracotta to be well bonded, and course with the brickwork, and no joint is to be more than $\frac{3}{16}$in. ($\frac{1}{4}$in.) in thickness, and the whole to be set in fine mortar and neatly pointed with a bevelled joint as

the work proceeds. All hollow blocks to be not less than 2in. thick in any part, and to be well soaked in water before being filled with concrete, which is to be composed of 1 part of Portland (or Roman cement), 2 of sand, and 4 of clean ballast to pass through 1in. ring.

9. *Arches, Ground Floor.*—The piers and arches on the ground-floor story to be built of well-burnt terracotta, according to the detail drawings, and jointed in accordance therewith with a neat mortar joint not more than ¼in. thick. All hollow pieces to be filled in solid with fine lime concrete as above described, and to be bonded with the brick backing. The arch blocks to be accurately set out and struck upon proper centres, and the arrises to be left true and regular. The enriched capitals and keystones are to be modelled according to detail drawings and to be clean and sharp. The blocks round brick piers to be well bonded with the brickwork, and flushed in with mortar (or cement mortar), and no piece to be chipped or filed after the burning so as to destroy the skin. Clean down at completion, and leave perfect to the architect's satisfaction.

10. *Window Dressings.*—The first and second-floor windows to be executed in accordance with the detail drawings, the pieces of terracotta to be well burnt and true in line, and to be jointed as shown. The semi-octagonal pilasters on each side of the windows to be bonded into the brick backing every other course 4½ (or 9in.), and the arrises and mitres of strings and caps to be true and sharp. No piece is to be filed or rubbed after the firing. All hollow pieces are to be filled in with fine concrete as above described, and the work to be well flushed in with mortar. The joints are not to be more than ¼in. thick, and to be neatly pointed as the work proceeds.

The transoms and heads of windows to be jointed with joggle joints as shown, and to be kept true in line, and the reveals and mullions of terracotta to be straightened and kept true near the casement frames.

THE SOCIETY OF ARCHITECTS.

THE sixth ordinary meeting of the Society of Architects was held at St. James's Hall, Piccadilly, on Thursday evening in last week, Mr. Silvanus Trevail, of Truro, vice-president, in the chair. Mr. George Herbert Gray, of Botfield House, Bexhill-on-Sea, was duly elected by ballot as a member, and a number of donations to the library were announced and acknowledged with thanks.

THE DECORATIVE USE OF MOSAIC IN ARCHITECTURE.

A paper on this subject was read by Mr. Schlentheim, of Messrs. Diespeker and Co., and was illustrated by executed examples of mosaic work, by numerous coloured cartoons, and by a series of lantern slides shown on the screen. The lecturer remarked that he proposed to show the many uses and advantages of marble mosaic as a flooring material. What is called Florentine mosaic is, he explained, not much used, and is not very suitable for floors. It is practically a series of geometrical designs produced in slabs of marble, cut by machinery, varying in size from an inch or two up to six inches, ten inches, or even more. It is very effective for the decoration of walls, and has been used with great effect in the Altar of Our Lady, The Oratory, Brompton; but for floors it has all the disadvantages of an ordinary marble-slab floor, particularly that of wearing badly, and is far more expensive.

ROMAN MOSAIC

is made up of tesseræ, mostly in the shape of cubes, generally varying in size from three-eighths to three-quarters of an inch, and this is the kind which has been mainly used in buildings in England until about 10 or 15 years ago. It is in this kind, too, that nearly all the well-known mosaics both in floors and on walls and all the famous pictures in the Italian cathedrals were executed. Of course, in the case of pictorial work it has mostly been done in Venetian glass, or, as the Italians call it, "smalto." For the purpose of external decoration, this style of mosaic might be used with great effect in spandrels, in tympanium of doorways, windows, and gables, panels of pilasters, stringing of façades, &c., as has been done in many Italian towns. Internally, it might be, and has been, used with great effect for friezes and for the decoration of ceilings. The Holborn Restaurant is probably the largest example in England of the use of glass mosaic for wall and ceiling decoration, and though no doubt the outlay at first was high, probably there are but very few buildings of even half that size which in the way of painting or redecoration costs so little to maintain. Roman marble mosaic for floors will need very little explanation, as it is probably well known to every architect. It has been laid by us and other firms throughout the country, and if only hard marbles are used it is of great durability. Any design can practically be executed in it. A kind of mosaic, however, that is coming into use more than any other sort of flooring in recent years is what we call Venetian marble mosaic, but what many architects and some firms of mosaic workers call "terrazzo." "Terrazzo" is not the right word, as what was called "terrazzo" by the Italians is nowadays but seldom used in England, and is never done by us. Nowadays "terrazzo" means a mosaic made up of small irregular pieces of marble, which are, so to say, sown or spread out on the top of the cement mastic, then rolled and rubbed down. We used to do this about twelve or fifteen years ago; but found that it did not answer well for the very rough wear to which it was subjected in the busy English towns, although lasting well enough in sleepy Italy. We have gradually worked out a system which looks, if anything, better than "terrazzo," and is far more durable, having the great advantage of all colours and patterns going right through. One objection that has been frequently raised by architects and others to the appearance of terrazzo is that it has a sort of plum-pudding appearance, as some say, or German sausage appearance, as others put it. Of course, that depends to some extent upon the lively imagination of the gentleman who makes the objection, and upon his more or less intimate acquaintance with German sausage (I must admit that German sausage on the floor is matter out of place); but there is a little truth in the suggestion, and we have tried, and I believe we have succeeded in producing a Venetian floor which gets rid of this supposed defect, as will be seen firstly by the specimens of Venetian mosaic all white or self-coloured, and in the system of ornamental Venetian which we have perfected in recent years. Only about ten or twelve years ago, wherever the "terrazzo" was used on account of its low price, the borders were still made of Roman cube marble mosaic. This added to the expense, and limited both the use of border-lines, and especially of ornamentation; but this difficulty has been overcome. In all manner of buildings this mosaic has been used—in mansions and in cottages, in theatres and in police-stations, in music-halls and in hospitals, in conservatories, bathrooms, kitchens, engine-rooms, lavatories, scullieries, dormitories, laundries, tank-rooms, and, in fact, in every conceivable sort of building. During the very severe winter of two or three years ago, numberless tiles in pathways and verandahs had to be taken up because they were loosened and damaged by frost, whilst in not a single instance did any of the many mosaic pathways and verandahs which we have laid suffer from this cause. This kind of mosaic lends itself to almost any purpose. For example, about two years ago a stone staircase of the Incorporated Law Society, Chancery-lane, was so worn away that nothing could have been done with it except to replace it by a new one but for our Venetian mosaic, with which we covered the treads, nosings, and risers of the staircase, thus making it practically a new one, more durable than it was originally, and, we believe also, more ornamental — the cost of this being only a slight proportion of what a new staircase would have been. From the

SANITARY AND UTILITARIAN POINT OF VIEW,

mosaic is even more to be recommended than for merely ornamental or decorative purposes, and for these reasons it is eminently suitable for infirmaries and similar institutions. We have lately laid many thousands of yards in such buildings, and both architects and doctors before whom the matter has been put have agreed that not only the flooring, but particularly the curved or circular skirting is of great advantage. As you will see from the specimens of this curved skirting in the room, it runs up the wall 2in., 3in., or 4in., as may be desired, and does away with all corners and with the right-angle which is ordinarily formed between the wall and the floor. In this right angle dirt, dust, and moisture will continually lodge, and it is difficult to thoroughly remove them. Sometimes, too, moisture will percolate through this joint at the right angle; all this is entirely obviated by our curved skirting, and this curved skirting adds but slightly to the cost. As mosaic is impervious to damp, and quite non-absorbent, its advantages in such buildings are self-evident. In many hospitals all the floors of the wards are also covered with mosaic. We have introduced channels in the mosaic floors in lavatories, scullieries, bathrooms, &c., which start perfectly level with the floor at one end of the room and gradually deepen until they reach the trap at the other end. If there is a slight fall in the floor from the other side of the room to the side on which the channel is, it will be apparent that all water will readily flow away, thus not only getting rid of any water that may be spilt, but also affording a quick and efficient means of cleaning or flushing the floor with water. Venetian mosaic is particularly suitable for use in swimming-baths, not only for the entrance, pathways, and dressing-boxes, but also for the bottom of the swimming-bath in lieu of glazed bricks. Not only is it cheaper than glazed bricks, but it is more durable, and its appearance will never be altered for the worse, whilst there is hardly a bath in which glazed bricks have been laid for some time where the glazing of some of the bricks has not come off. A particularly objectionable feature of glazed bricks in swimming-baths is the effect produced upon the eye of any onlooker by the pointing of the bricks under water. As the water is always more or less in motion, even when there is only one person in the bath, a number of dark lines seem to be continually contracting and expanding with every movement of the water, and, so to say, dancing before the eye like a number of rectangular or geometrical cobwebs. This is very distressing to the eye, particularly to the eye of a mosaic manufacturer. In the pathways it is advisable to use the curved skirting previously referred to as a connection between the pathways and the usually slightly-raised dressing-boxes. The gutter, too, which formerly has been done in slate slabs in most baths, can be done in mosaic in the same manner as the channel in hospitals, previously described, and the advantage in mosaic will be that instead of having slate slabs of certain lengths with frequently recurring joints, the gutter can be formed in the mosaic, rising and falling, without any joint whatever. It can be placed near the dressing-boxes, as has been done in some cases, or near the edge of the pathway. In the new swimming-baths at Hull, in which we are laying the mosaic, the whole kerb or coping is done in this Venetian mosaic, the kerb or coping protruding about 5½in. over the sides of the bath, and being 4in. thick. It can, of course, be made thinner than that.

MOSAIC HEARTHS.

A little while ago we took out a provisional patent for hearth and fender or kerb combined, and though we have not pushed the manufacture of this article, and are, therefore, not able to show a better specimen than the one in the room, we think these hearths would come in well in many buildings, especially as they are probably cheaper than the ordinary hearth and marble kerb. They can be done in any colour and in any design. For fire-cheeks, too, mosaic can be used with great effect, not only containing design, but crests, monograms, or mottoes could be very neatly introduced. With both glass and marble mosaic very artistic effects can be produced in dado-work and wall-covering, and we have a number of drawings of such in the room. They are, for such purpose, far more durable than tiles, as it frequently happens that tiles become loose and come off the walls. This does not happen with mosaic, owing to the smallness of the tesseræ used. In conclusion, one of the greatest advantages of mosaic from the decorative point of view is that any design, from the simplest to the most intricate, can be executed; that there is no manufacturer's stock in certain patterns which he is anxious to dispose of; no habit of the workman to work to a certain design and to no other; no mould or die or cast which greatly enhances the cost of any new pattern, and which helps to make the manufacturer conservative in design; no limit whatever to the taste and originality of the architect or of the designer; no limit to the power of execution of the mosaic worker, save that set by the imaginings of the artist; architects, builders, and owners are quite free to select, to suggest, to invent unguided and unfettered by a fixed number of stock patterns. Mosaic must, therefore, be eminently conducive to the exercise of individuality in beautifying our houses, and a great factor in fostering artistic independence and artistic thought.

The Chairman, in opening the discussion, said until he saw them on the screen he had not known that the mosaics laid down at the Devon and Cornwall Bank, of which he was the architect, would be exhibited that evening. These mosaics were designed and executed by Messrs. Diespeker and Co., and had given the directors of the bank great satisfaction. He must admit he had a great partiality for mosaics. When he was in Rome some twenty years ago, he was struck with the old work of the kind, and noted how effective the ancient mosaics looked, and how well they had worn. The more architects could see of good mosaic work, the more would it assist them in their professional duties. Tiles were very good in their way and in their proper places, but there were many opportunities for using mosaics to advantage, such as banks, conservatories, &c.

Mr. G. Gard-Pye, in proposing a vote of thanks to Mr. Schlentheim, remarked that architects sometimes neglected to provide a proper stable foundation for mosaic work, the consequence being that it cracked. Unless they, as architects, insisted upon having their floors properly laid, justice would not be done to the mosaic manufacturer.

Mr. W. Cooper, of Hastings, who seconded the vote of thanks, suggested that it would be well if the Society of Architects were more frequently to invite manufacturers of special kinds of goods to read papers before them, as members, after listening to such an address as that just given, would be in a much better position in preparing their specifications.

Mr. G. A. T. Middleton inquired as to the differences between Roman mosaics, which, as all know, were made up of tesseræ, and the Florentine and Venetian mosaics. There seemed to be much difference of opinion as to the uses of mosaic, but as a floor material he considered it could hardly be surpassed. For wall decoration, its employment might be more open to question. On Easter Sunday he entered the Cathedral of Brunswick, an enormous Romanesque church, the walls of which were covered with the most glorious fresco work, but he could not help thinking how much more beautiful it would have appeared in mosaic than in brilliant colour, for the tesseræ would have given the needed texture to the surfaces. For ceiling covering, there was still more question as to the desirability of the employment of mosaic. He differed from the lecturer as to the value of the mosaics in the new work at St Paul's Cathedral and the new work at Aix-la-Chapelle; and to his mind that at St. Paul's was the more beautiful. One could not see from the floor what the design was, but was impressed by the rich blaze of colour, and often by a certain texture in the mosaics. It was that texture which one missed in Salviati's work at Aix-la-Chapelle, and although the design was perfect, he distinctly preferred the effect at St. Paul's.

Mr. Ellis Marsland asked if in swimming-bath work it was necessary to have an asphalte surface under the mosaics, for if the asphalte was unnecessary, the price of mosaics would be brought within reasonable limits for public baths.

In acknowledging the vote of thanks, which was cordially adopted, Mr. Schlentheim said the question of the asphalte foundation did not affect the cost of flooring for swimming-baths at all, since plain mosaic was cheaper than glazed bricks, even of the second or third quality; and his firm had executed mosaic work in baths at 6d. per square yard. But, as a matter of fact, a bed of asphalte was not required, providing that the mosaics were put on a properly-laid bed of concrete. He still differed from Mr. Middleton as to the relative merit of the mosaic work at Aix-la-Chapelle and St. Paul's; he admitted that St. Paul's was indeed a rich blaze of colour, but he did not think that the skill, money, and beautiful design were well expended or placed when the only effect they produced on the spectator was that of a blaze of colour. Mr. Gard-Pye had referred to the cracks in mosaic work; these were due to the cracking of the concrete beneath. If the concrete were properly laid, it would not be fissured, and thus the mosaic work above would remain unbroken; but when once the concrete was cracked the mosaic would be sure to follow. He would emphasise the fact that mosaic work could be executed as cheaply as tiles, and it had been laid in tank-rooms, lavatories, and large factories.

The British Archæological Association will hold their Congress at Peterborough, from July 14 to July 20.

NEW MODE OF PROTECTING THE BANKS OF RIVERS FROM EROSION BY WATER.

THE banks of rivers and canals, whether natural or artificial, are incessantly exposed to a process of destructive disintegration from the eroding action of the running water which is constantly impinging against them. For an example in point, in which the deteriorating influence of a fairly rapidly-flowing stream has taken effect, the river wall protecting the embanked walk along Battersea Park may be quoted. It must be admitted that being composed of a very inferior description of mingled stone and concrete, it is a very poor wall, which, no doubt, accounts for the fact that it is now useless for the purpose for which it was originally intended, and that the London County Council intend repairing it where possible, and rebuilding it where not. There is no doubt that experience has shown that both banks of a navigable waterway are simultaneously affected by running water, but not by any means to the same extent. In all instances it is the concave bank, when the course of the stream is of a curvilinear contour, that suffers most. In fact, in some cases and under certain conditions the opposite or convex bank scarcely appears to be injured in any way. The ordinary methods in use among engineers and builders, and adopted by them to protect the banks, are various. Sometimes a wall constructed of fascines, and well payed over with clay, will answer sufficiently. At other times a timber wall, built of main piles, 12in. by 12in., with

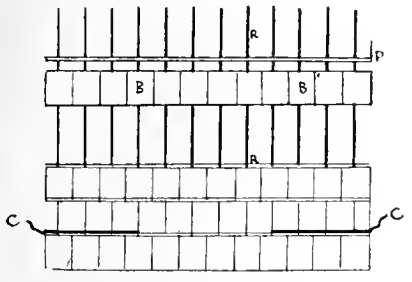


Fig. 1.

struts, ties, and stringers, all braced together by vertical sheeting piles, will afford the protection required. Again, the proposed goal may be reached by the employment of a long wooden coffer dam or hollow wall, filled in from front to back with stones, and reinforced at the base on the outside by the deposition of large blocks and pieces of rockwork. When all these means fail, recourse must be had to the only and *dernier ressort*—that is, the solid, massive wall of carefully-executed masonry. Our Metropolitan river walls are splendid examples of this never-failing mode of protection.

One of the principal objects to be attained by these riverain walls is to divert the current, or the "wash," as it might be termed, from the shore or bank, and throw it more into the direction or axis of the stream. In this manner not only is the direction of the wash very sensibly modified and ameliorated, but the bed of the waterway is deepened by the increase of scour subsequently induced. Most of these methods of dealing with hydraulic questions, which are continually occurring, are not only of a costly character, but call for the exercise of considerable skill, experience, and much time before they can be carried out. They cannot be suddenly improvised to serve as mere temporary or palliating measures, and require a thorough professional survey and study of the whole of the particular part of the stream which will be affected by the proposed new work. It is a more or less ticklish matter to interfere with the natural course of any river or stream. They always resent it, and if prudent counsels do not prevail, and a too coercive *régime* be adopted, not only is the object aimed at frequently defeated, but a good deal of damage is done, so that it may be truly said, the last state of the river is worse than the first. A new mode of procedure which is well worthy of notice has been recently introduced with excellent results on some of the Italian waterways. The principle involved is quite the reverse of that belonging to the more usual methods. Instead of endeavouring to replace a natural bank damaged by aquatic erosion by an artificial one of a more solid and substantial character, the bank is covered with a light and pliable facing. This flexible protector is, in fact, nothing else than a particular example of a combination of brickwork and iron. The body of the facing (see Fig. 1) is composed of specially prepared pressed bricks, B B, through which are passed iron rods R R. One course of bricks is shown lifted up in Fig. 1, which may be regarded as one length of the facing. In order to connect successive lengths, chains, C C, are run through the rods at suitable intervals, and thus unite the whole longitudinally, while the rods perform a similar duty both vertically and horizontally. The rods are all held together by a perforated plate, P, through which they pass at every course of bricks, each of which weighs 20lb. All the metalwork is galvanised to preserve it from rusting through the action of the mortar and other contributing causes. Each length measures about 25ft., and they are readily placed *in situ* by suitable machinery fixed up in a boat. Rapidity and facility of execution and a comparatively very low cost are the distinguishing characteristics of this new protector for river banks, and we add to these features that lengths of it can be made in advance and kept in reserve for any emergency. Its advantages and merits are too obvious to require further description. T. C.

STEEL AND CONCRETE COMBINATIONS.

AN interesting paper on "Steel Concrete Construction" appears in the *Transactions* of the Society of Civil Engineers. The author, Mr. George Hill, Assoc.Am.Soc.C.E., deals with certain combinations of concrete and steel, in which the latter acts in tension, and is distributed through the bottom section of the slab. The best results are obtained when the compression is taken by the concrete and when the metal employed is so placed as to occupy the position of the extreme fibre on the tension side. The steel requires to be held in place by some means possessing greater strength than simple cohesion between it and the concrete. Tests have been consequently very difficult, and no formula has been made that will account for the high resistance of sections tested under concentrated loads. Mr. Hill describes a series of tests made upon 56 slabs of concrete and expanded metal of varying spans and thicknesses both of concrete and of metal, supported on T beams of uniform widths. The materials used for the concrete were as follows:—The cement used was American Portland and a slag cement. For the first the manufacturers claim a fineness of 90 per cent. on a No. 100 sieve, and of 70 per cent. on a 200 sieve. A minimum tensile strength of neat cement for seven days of 400lb., and for 3 parts of sand to 1 part cement seven days, 150lb. was guaranteed. Under actual test the tensile strength exceeded the guaranteed, the average of 30 tests giving 624lb. The sand was Cow Bay sand clean and sharp and of varying sizes, ordinary steam cinders were used of varying fineness, and the stone was trap broken to pass a 1½in. ring. The metal used was the expanded metal made from high grade low-carbon Bessemer steel. The testing machine is minutely described, and the results are summarised in a series of tables to which we refer the reader. The application of the load was at a uniform rate. The deflections were also at a uniform rate, and were proportionate to the load up to the point where the elastic limit was reached, after which they increased considerably; the bottom surface of concrete began to show the compressing action of the strands of metal by breaking into small cracks and puckering up. In no case was there any collapse of the section until ample warning had been given, and then not till the rate of thickness of slab to span was far less than would be allowed in practice. The first crack in most cases developed over the inner edge of the I beam supporting the slab; the centre of the slab usually crushed under the loading plank. The tests show much irregularity and indicate the necessity of a more uniform method of mixing the concrete. The author further remarks in relation to these tests: "The strengths shown by the mixtures in which slag cement was employed are worthy of note, since the neat tensile strength tests showed a less strength than those in which American Portland was used, while in the actual use of the cement this difference disappears, and seems to indicate a considerable advantage, due to fineness of grinding." He says: "These tests show that a centrally-applied load of 3,200lb. produces a deflection sufficient to crack plaster, a compressive

strain of 300lb. per square inch in the concrete, and a tensile strain on the metal of 3221b. per inch of width, and a load of 1,580lb. reached the elastic limit, producing a compressive strain of 400lb per square inch in the concrete, and a tensile strain of 500lb. per inch of width on the metal." An examination of the table shows varying results for similar conditions—as, for example, slabs made with the same mixture of concrete vary as much as those made of other mixtures. Other irregularities are noticed, to be accounted for only by the differences due to fineness of the cement used. In some instances the steel failed before the concrete.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XXII.

By an Assoc. Inst. Elect. Engs.

CIRCUIT TESTING.

LEAKAGE CURRENTS AND THEIR MEASUREMENT.—When we remember that an electric light or power cable is subjected to an electric pressure all the time that it is active, and that it is liable to mechanical injury during the wiring or laying of the cable, it is obvious that small faults, insignificant in themselves perhaps, should be removed as early as possible, since the accumulation of small faults results in excessive leakage, and this means waste of power and money and possible danger. And what is more important, the insulation covering of cables tends to deteriorate, especially if dampness be present, as then the insulating qualities of the covering rapidly diminish, and electrolytic action is set up, with

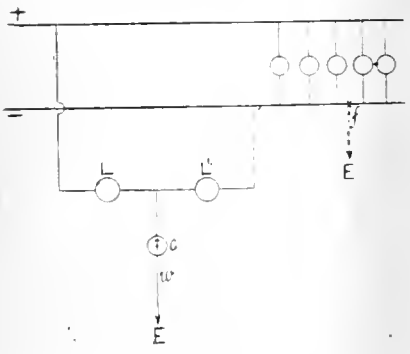

Fig. 75.

the result that the conductor is eaten through, or a short-circuit occurs. And although the resulting leakage currents may eventually attract attention, either in consequence of electrolytic action, heating, or other prejudicial effects, it is of the utmost importance that frequent tests be made, so that the faults may be detected and removed. And although it must be admitted that much good work is done, it is equally true that defective and inferior work is also done, and anyone who has inspected and tested wiring work knows only too well that many of the following defects which are met with could, and would, be prevented by conscientious wiremen. The most common defects are—(1) inferior material, (2) wires in electrical contact at crossings for tees and branches, (3) contact between a conductor and the earth, (4) absence of casing or other protection on passing through walls and between floor and ceiling, or behind wainscoting, and at the back of switchboards; (5) defective and badly insulated joints, in consequence of which moisture penetrates and saturates the insulating covering; (6) inferior connections to fittings, and defective fittings; (7) faulty places in the covering due to cuts or abrasion during wiring; (8) junction-boxes not water-tight; and (9) indiscriminate selection and use of fuses.

Faults are in practice usually divided into two classes, *partial earths* and *dead earths*, the term "earth" denoting a defective part of the wiring, the potential of which, in consequence, approaches that of the earth. A *partial earth* is a defective part not making actual metallic contact with the earth, whilst a *dead earth* occurs whenever actual metallic contact is made with the earth. It is obvious that a dead short-circuit results when there is a dead earth on both the positive and negative mains. When this happens the main fuse blows, as then the resistance of the circuit is a minimum and the current a maximum. To avoid partial earths becoming dead earths, periodic testing for faults should be made; since there is not the possibility of leakage currents making themselves self-evident so early as is the case with gas and water circuits. Many interesting and effective methods of testing the character of the insulation of circuits have been devised,

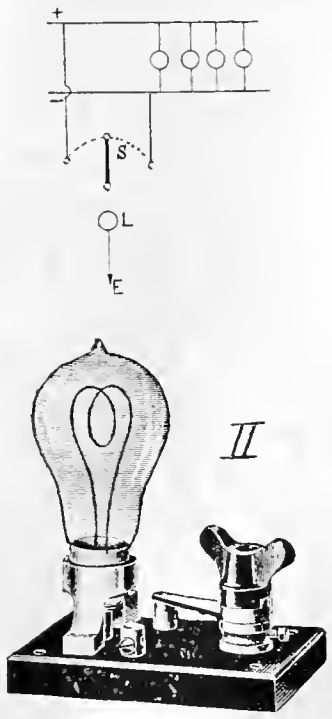

Fig. 76.

and the following notes are given with the hope that private and isolated plants and private houses may be thoroughly protected from danger and waste of electrical energy.

It may be remarked here that inasmuch as an installation is thoroughly tested before the current is turned on, this is often thought sufficient; and since the ordinary methods of testing the insulation resistance of an installation—i.e., by means of a testing-set, &c.—are not applicable on an active or live circuit, the matter is neglected. Means, however, should be at hand for giving continuous indications of the insulation in all cases, so that any deterioration or defect may be determined as soon as it occurs, and it is noteworthy that very approximate values for the insulation resistances of the mains individually, or of the combined installation, may be obtained during the working of the circuit. The methods to be described depend upon the fact that there is no substance which is an absolute insulator, and that the resulting leakage current enables readings to be taken which give a measure of the quantities desired. At the outset it must be understood that it is impossible to fix an absolute value for the insulation resistance of all installations. The working

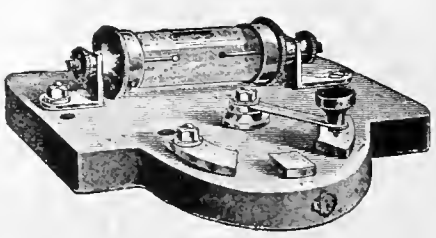

Fig. 77.

pressure and the number of lamps in use, or the magnitude of the current utilised, must be taken into account, and as these vary, so will the insulation resistance vary, and still give satisfactory results.

Leakage Indicators.—The simplest continuous telltale is arranged as follows, and shown in Fig. 75. Two identical glow-lamps, L and L', of a voltage such that they would be fully illuminated if placed separately between the mains, are joined in *series*, as shown, in which case they furnish only a reddish light—i.e., burn at a dull red. The wire connecting these lamps, however, is perfectly earth-connected by means of the wire *w*, in the circuit of which a trembling-bell or galvanometer is interposed, as shown. As long as the insulation of the circuit is satisfactory no current passes to earth along *w*, and the bell or galvanometer is inactive. The aspects of the two lamps are identical. As soon as a fault occurs, however, the wire *w* is traversed by a leakage current, and the bell or galvanometer is set in action. Furthermore, the lamp connected to the perfect main glows more brightly, whilst the other, connected to the faulty main, glows less brightly. To understand this action, let us suppose that the fault is at *f* on the negative main: it is evident that the insulation resistance of this main will be lower than that of the positive, so that a current may flow through L and the indicating instrument to earth, and so complete its circuit through the weak point *f*. As a matter of fact, the lamp L' is shunted by this leakage circuit, and consequently receives less current. In this way unequal brilliancy indicates unequal insulation resistances of the mains, and it must be remembered that the defective main is connected to the lamp burning less brightly. The weakness of this test, which is so simple, is that equal brilliancy results if both mains have equally a low-resistance.

In some cases the evidence of a single lamp suffices, and although this does not form a permanent continuous leakage indicator for both mains, it is a convenient arrangement for making

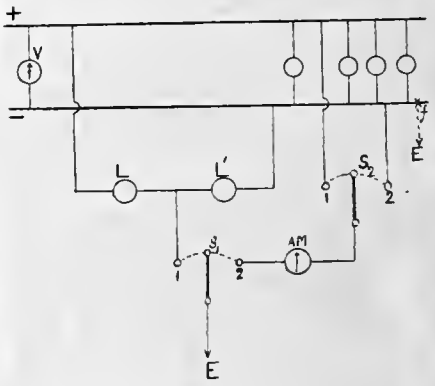

Fig. 78.

periodic tests. As represented in Fig. 76 L, one terminal of the lamp is permanently connected to the switch-arm of a two-way switch, S, whilst the other is permanently earthed, and the mains are connected to the two studs of the switch. On moving the switch-arm to the right and left, each main is in turn put to earth, and if the lamp lights up, the main not connected to the switch-arm is defective. A leakage indicator of this type is shown in Fig. 76 II. It is sold by Messrs. Berend and Co., Limited.

Another very simple and effective leak detector, introduced by Messrs. Woodhouse and Rawson, is shown in Fig. 77, and is interesting, as it depends upon electrolytic action. As is well known, decomposition takes place whenever a compound liquid is interposed in an electric circuit, and either a metal is deposited, gases set free, or a discolouration at the electrodes is produced. It is the discolouration effect which is utilised in this detector to indicate the existence of a leakage current.

The appliance consists of a switch-key and a pole-indicator, the latter being a glass tube containing a white transparent liquid in which two platinum wires are supported by the metal stoppers which close the tube and form the terminals. The gap between the platinum wires is such that there is about $\frac{1}{4}$in. of the liquid between them, and if a current is passed from one to the other the liquid is decomposed, and the negative pole is at once covered with a purple tinge by the electrolysis of the liquid. The decomposed substance is rapidly dissolved again by the liquid on the cessation of the current, and the white colour of the liquid is restored. The resistance of the liquid between the platinum wires is about 30,000 ohms; but the indications of the current are quite apparent, with a difference of potential between the terminals as small as four volts.

For use as a leak detector, one terminal of the

pole-indicator is connected permanently to earth, and the other to the switch-arm, whilst the mains are connected to the right and left contact-pieces of the switch. By moving the clapper key to the right or left, each main is put separately to earth by depressing the key, and if any leakage exists, discolouration at one of the electrodes will result; if no discolouration ensues, the line may be taken to be in good condition. When this appliance is out of use the arm of the switch is placed on the central dummy contact-piece. As the full electro-

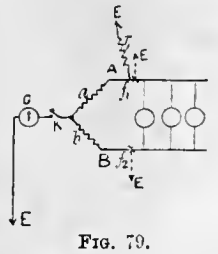

Fig. 79.

motive-force of the circuit may be used in making the test, only momentary contacts should be made. This detector is extremely useful for periodic tests.

Sir David Salomons, Bart., has devised a simple appliance for use in private houses. He describes it as follows:—"It is a high resistance galvanometer, taking the place of the pole-tester, and a double spring-key replacing the switch. This key is so arranged that no contact is made except when one end or the other of the lever is pressed. The lever is constructed in such a way that only one contact can be made at a time. The galvanometer is protected by a heavy iron case from outside electric influences. In the improved form there is an additional little switch, which can assume two positions. Turned one way, the instrument is ready for testing; turned the other, it can be used as a voltmeter. The scale is graduated in degrees, divisions of megohms, and volts. There is also an indicating needle, which is set to the margin of safety, allowed in the house where the instrument is placed. It is only necessary for one of the servants every morning to press successively the buttons on the lever, and to note that the needle does not pass the fixed pointer on the dial. If this should happen, the fact will be reported to the head of the house, and he will naturally call in someone competent to discover the fault. When such an instrument is employed in a house, it is generally desirable to have an independent battery of dry cells, and to place them in circuit after cutting the D P (double-pole) main switch, to make sure that any leakage indicated is that existing in the house, and not due to any faults outside it. The manufacturers, Messrs. Elliott, will always mark the dial to indicate the limit of deflection permissible in any given installation by marking a red line, against which is placed 'danger.' This would render the house safe."

Quantitative Tests without Interrupting Work.—The following is a simple and practical arrangement which could be used in isolated plants with good results. In Fig. 78, let V denote the voltmeter connected between the mains, S_1 and S_2 two

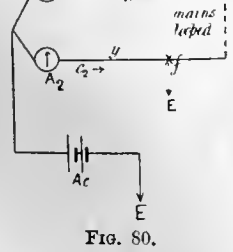

Fig. 80.

two-way switches, and A M a suitable ammeter. From what has already been said, it will be clear how to find on which main a fault is by simply using the switch S_1. To determine the resistance of a fault, supposed to be at f on the negative main, proceed as follows: Place the switch-arm of S_2 on stud 1, and the switch-arm of switch S_1 on stud 2; in which case suppose the ammeter to read c ampères, and let V indicate the difference of potential between the mains as given by the voltmeter. Then, if r_a is the resistance of the ammeter, the resistance of the fault will be—

$$f = \frac{V}{c} - r_a.$$

The following method, due to Dr. Hopkinson, is suitable for estimating the insulating resistance of each main. Suppose the insulation resistance of the positive and negative to be f_1 and f_2 respectively. The ends A and B of these conductors are connected by means of adjustable resistances a and b to one terminal of the key K, the other terminal of which is connected to earth through the galvanometer G, as shown in Fig. 79. Then, if a and b be adjusted so that there is no deflection—

$$\frac{f_1}{f_2} = \frac{a}{b}, \text{ or } f_1 b = a f_2.$$

Now introduce an artificial leak of resistance r_1 to earth, so as to be in parallel with f_1 (say), as indicated in Fig. 79, and again adjust the variable resistance a_1 and b_1 (say) to give zero deflection, then—

$$\frac{\frac{f_1 r_1}{r_1 + f_1}}{f_2} = \frac{a_1}{b_1}$$

since f_1 and r_1 are in parallel.

$$\therefore \quad b_1 f_1 r_1 = a_1 f_2 (r_1 + f_1);$$

but—

$$f_2 = \frac{f_1 b}{a}$$

$$\therefore \quad b_1 f_1 r_1 = \frac{a_1 f_1 b}{a} (r_1 + f_1),$$

and—

$$a b_1 r_1 = a_1 b r_1 + a_1 b f_1,$$

from which—

$$f_1 = \frac{r_1 (a b_1 - a_1 b)}{a_1 b}.$$

Similarly f_2 may be determined.

If the fault be known to exist in one of two branches, its position may be approximately

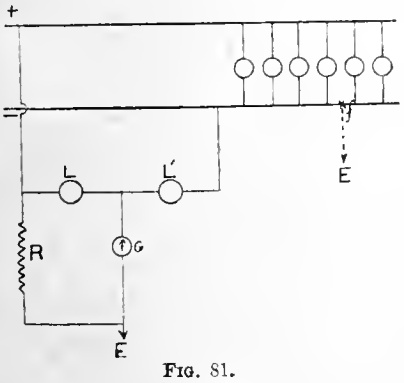

Fig. 81.

found by using two ammeters simultaneously. The far ends of the branches are looped as shown in Fig. 80, and the near ends are connected through separate ammeters A_1 and A_2 to one pole of a source of electricity, dynamo or accumulators, the other pole of which is earth connected as shown. Then if x = length of $A_1 f$, the resistance of which (including that of the ammeter A_1) is R_1; and l = the total length of the loop $A_1 f A_2 = x + y$; whilst R_2 = resistance of segment $A_2 f$ or y; and C_1 and C_2 = the readings of the ammeters A_1 and A_2—

$$\frac{C_1}{C_2} = \frac{R_2}{R_1} = \frac{y}{x} = \frac{l - x}{x},$$

since R_2 and R_1 are in parallel.

$$\therefore \; C_1 x = C_2 (l - x) \text{ and } x = l \frac{C_2}{C_1 + C_2}.$$

Similarly—

$$y = l \frac{C_1}{C_1 + C_2}.$$

M. Picou has also introduced a simple modification of the method of detecting a leak for determining the resistance of a fault. The arrangement is shown in Fig. 81, and consists in introducing a rheostat, so that resistance may be introduced to bring the galvanometer reading back to zero. Let us suppose that a fault exists at f on the negative main as shown. Then as we have already shown, the galvanometer needle is deflected, and the lamp L (which glows more brilliantly than L'), together with the galvanometer may be looked upon as a shunt to L'. By introducing the rheostat as shown, the lamp L is shunted, and the resistance may be so adjusted that the galvanometer needle is not deflected. In this case the resistance introduced is approximately that of the fault. To get a more exact result the lamps are interchanged, and a second reading taken; then if R' be the second resistance introduced by means of the rheostat, the actual resistance of the fault is the square root of the product of the two readings. From the first test we get—

$$\frac{L}{L'} = \frac{R}{x}, \text{ or } L x = R L',$$

where x is the resistance of the fault. From the second test we get—

$$\frac{L'}{L} = \frac{R'}{x}, \text{ or } L' x = R' L,$$

and by multiplication—

$$x^2 = R R', \text{ or } x = \sqrt{R R'}$$

For continuous indications it is a common practice in supply stations to use recording voltmeters instead of two lamps, and, as will be seen, much valuable information respecting the insulation of a circuit can thus be determined. To simplify matters, we shall assume that one voltmeter is used to determine separately the differences of potential between earth main and the earth. If one terminal of the voltmeter be permanently earth-connected, as at O in Fig. 82,

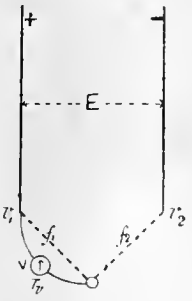

Fig. 82.

these differences of potential may readily be determined. Let E be the voltage between the two mains, v_1 and v_2 the differences of potential between the positive and negative mains and the earth respectively, f_1 and f_2 the insulation of these mains respectively. Then, when taking the difference of potential between the positive main and the earth (as shown in Fig. 82), the voltmeter is a shunt to f_1, and we have a two-branched multiple-arc circuit to earth, or, in other words, the voltmeter of resistance, r_v, is one branch, and the insulation covering of resistance f_1 the other. Then, current through voltmeter + leakage current from positive main = current from earth to negative main, or in symbols, if v_1 = difference of potential between positive main and the earth.

$$\frac{v_1}{r_v} + \frac{v_1}{f_1} = \frac{E - v_1}{f_2} \quad \ldots\ldots\ldots\ldots (a)$$

and—

$$v_1 \left(\frac{1}{r_v} + \frac{1}{f_1} + \frac{1}{f_2}\right) = \frac{E}{f_2} \quad \ldots\ldots\ldots (b)$$

or—

$$v_1 \left(\frac{1}{r_v} + \frac{1}{F}\right) = \frac{E}{f_2} \quad \ldots\ldots\ldots (c)$$

where $\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2}$, since the insulation resistances f_1 and f_2 are in parallel, and F = total insulation resistance of the circuit.

Similarly, for the negative main—

$$\frac{v_2}{r_v} + \frac{v_2}{f_2} = \frac{F - v_2}{f_1} \quad \ldots\ldots\ldots\ldots (d)$$

and—

$$v_2 \left(\frac{1}{r_v} + \frac{1}{f_1} + \frac{1}{f_2}\right) = \frac{E}{f_1} \quad \ldots\ldots\ldots (e)$$

or—

$$v_2 \left(\frac{1}{r_v} + \frac{1}{F}\right) = \frac{E}{f_1} \quad \ldots\ldots\ldots (f)$$

Adding (e) and (f)—

$$(v_1 + v_2) \left(\frac{1}{r_v} + \frac{1}{F}\right) = \frac{E}{f_1} + \frac{E}{f_2} = \frac{E}{F}$$

$$\therefore \quad \frac{v_1 + v_2}{r_v} = \frac{1}{F} [E - (v_1 + v_2)]$$

And—

$$F = \frac{r_v [E - (v_1 + v_2)]}{v_1 + v_2} = r_v \left\{ \frac{E}{v_1 + v_2} - 1 \right\}$$

= total insulation resistance of circuit.

Again, from (e) and (f)—

$$\frac{v_1}{v_2} = \frac{f_1}{f_2}, \text{ and } f_2 = f_1 \times \frac{v_2}{v_1}.$$

Substituting this value in f_2, we get—

$$\frac{r_1}{r} - \frac{r_1}{f_1} = \frac{(E - r_1)}{f_1 r_2}.$$

$$\therefore \frac{1}{r} - \frac{1}{f_1} = \frac{E - r_1}{f_1 r_2},$$

and—

$$\frac{1}{r_1} = \frac{E}{f_1 r_2} - \frac{1}{f_1}$$

$$= \frac{E - (r_1 + r_2)}{f_1 r_2}.$$

Therefore—

$$f_1 = r_1 \frac{[E - (r_1 + r_2)]}{r_2}.$$

Similarly—

$$f_2 = r \frac{[E - (r_1 + r_2)]}{r_1}.$$

To determine the leakage current—

$$C = \frac{E}{f_1 + f_2}$$

$$= \frac{E}{r_1 \frac{[E - (r_1 + r_2)]}{r_2} + \frac{[E - (r_1 + r_2)]}{r_1}}$$

$$= \frac{E r_1 r_2}{r_1 (r_1 + r_2) [E - (r_1 + r_2)]}$$

Expressions for the Insulation Resistance of a Circuit.—It will be interesting at this point to refer to the different methods of stating the insulation resistance of an installation. It is obvious that—

(1) The insulation resistance should be directly proportional to the electromotive-force of supply, and—

(2) The insulation resistance should be inversely proportional to the length of the circuit, which may be denoted by the maximum current or the number of lamps installed.

(*a*) The Institution of Electrical Engineers' Rule gives—

$$R_i = \frac{\text{constant}}{\text{current}} = \frac{K}{\text{max. current}}$$

and— $K = 10$ megohms.

(*b*) Many supply and insurance companies—

$$R = \frac{\text{constant}}{\text{no. of lamps}}.$$

(*c*) Maximum leakage current allowed. Maximum leakage current—

$$c = \frac{\text{current}}{\text{constant}} = \frac{1}{K} \times \text{max. current.}$$

The value of K fixed by the Board of Trade is K = 10,000.

$$\text{Since leakage current} = \frac{E}{R_i} = \frac{1}{K} C = c.$$

$$\therefore R_i = \frac{K E}{C} = 10{,}000 \frac{E}{C} \text{ (Board of Trade.)}$$

$$= 10{,}000{,}000 \frac{1}{C} \text{ (Institute's Rule.)}$$

(*d*) Professor Jamieson's rule introduces pressure of supply, or—

$$R_i = K \frac{E}{N} \text{ (N = number of lamps.)}$$

By fixing K at 0·1 megohm, it is clear that R_i should not be less than 100,000 ohms per lamp for every volt employed.

(*e*) In Picou's rule, as given before the International Society of Electricians, Paris, in 1888, both the pressure and current were introduced, thus—

$$R_i = K \cdot \frac{E}{C},$$

and since $\frac{E}{C}$ = conductor resistance, it is possible to express insulation resistance in terms of the conductor resistance, or $R_i = K \cdot R$.

(*To be continued.*)

THE SURVEYORS' INSTITUTION.

AT the ordinary general meeting, held on Monday last in Savoy-street, the discussion was resumed on Mr. H. M. Grellier's paper on "Tithe Rent-Charge Redemption."

Mr. J. W. Kemsley, speaking as a tithe collector, as a tithe payer, and as a tithe owner, said that he found no desire on the part of the tithe payers to redeem, even though terms were offered better than those proposed by Government.

The Rev. D. Lamplugh said that the successful working of the various Tithe Acts—from that of 1836 to the Act of 1891—was due mainly to the honesty and straightforwardness of the men who acted between the owners and the payers. He, personally, should like to see Tithe Rent-Charge fixed at £70 per £100 free of variations and free of local rates. If the value rose, as it now seemed likely to do, landowners would feel the pinch, as their rents would not rise proportionately.

Mr. Holbeche said that most landlords received their Michaelmas rents in January, and were, therefore, glad to avail themselves of the three months' grace for paying the tithe.

Mr. J. H. Sabin pointed out some essential differences between the provisions of the Tithe Act, 1891, and the Finance Act, 1896, the one recognising the separate ownership of the land and the tithe, and the other taking them as one ownership.

Mr. Daniel Watney said he was surprised, after merging some tithe rent-charge, to find that he was still charged with the same Income-tax and Land-tax.

Mr. Grellier, in reply, said that the bare mention of tithe rent-charge seemed to deprive some persons of all judicial reasoning, and he believed that the Act of 1891 had done great good by transferring the question from the hands of tenant tithe-payers, who were influenced by agitators, to that of landowners, who were outside that influence. The calmness was also, he thought, in part due to the fall in the corn averages, which controlled the value of tithe rent-charge, and in part to sympathy with the clergy, whose incomes from tithe had during the last 20 years been reduced about 40 per cent. The Act had also provided a sort of safety-valve for the incensed tithe-payer, who could take his case into court and then calmly submit to the judgment of His Honour that he must pay, which he generally did with but little grumbling. The difference between corn rents and tithe rent-charge was, broadly speaking, that while they both varied in value with the varying price of corn, the former were leviable and recoverable under the provisions of local Acts, while the latter were controlled by the Tithe Act of 1836. Where a landowner wished compulsory redemption of tithe he must comply with the terms of the Act, and pay, generally speaking, 25 years' purchase: but, of course, two parties could agree between themselves to voluntarily redeem at any price they liked to fix, if one were a lay impropriator owning the land in fee simple. He thought that both the parties, tithe-owner and tithe-payer, were fairly satisfied under the present arrangement, as provided by the Act of 1891.

The discussion on Mr. Blashill's paper, read at Manchester on April 20, entitled "Lessons from Fire and Panic," was then resumed. Mr. A. Harston said that in his opinion a fireproof building had not yet been contrived, and all that was really attainable was a building which would retard the progress of a fire. If he had to build an absolutely fireproof building, he should be compelled to design it like a beehive, and stop up all means of access of air. The nearest approach to "fireproofing" was to employ materials which would resist fire as long as possible. Coke breeze concrete was valuable, not only that it was fireproof, but that it was light, and gave the opportunity of nailing down the boards to it, so that there was no dangerous air space under them. If possible, wooden floors were to be avoided. The great disadvantage of using firebrick as a material for concrete was its weight. Pumice was light and good but expensive; while coke breeze was cheap, costing only something like 5s. a ton; but it must not be forgotten that under intense heat coke breeze expanded considerably—in a length of 28ft. it would expand some ¾in. under a temperature of 3,000°, and would soon break up altogether. He remembered an objection being raised by the chief officer of the Fire Brigade that he could not make a hole in a roof, built with the intention of making it fireproof, for the purpose of getting water into a burning building. It was becoming increasingly important in London to have roofs that could be walked over. So many telephone and telegraph men damaged one's roof that it was difficult to keep it watertight. Matchboarded walls in factories and shops were a distinct danger: but he knew of many important modern buildings which were matchlined throughout five or six stories.

Mr. A. R. Stenning said that the author of the paper had, of course, exceptional opportunities of obtaining information as to the causes and the means of prevention of fires in London, and his paper must therefore be one of great value to all surveyors practising in large cities. It was, he thought, practically impossible to make any large building absolutely fireproof, for iron or steel girders and joists, however well cased in, were liable to twist and thrust out the walls. He agreed that the most important matter was to use fire-resisting materials as far as possible, which could be relied on to keep any outbreak of fire confined within a small space. He had himself used in erecting artisans' dwellings some 6½ acres of flooring composed of steel joists with fireclay pipes notched to the lower flange, and the whole filled in with coke breeze, thus making a light and almost indestructible floor. He had one fire during the construction of these buildings, which broke out among the very inflammable materials of a room used as a joiners' shop, but it spread no farther than that room, and did very little damage to the structural fittings. He might say that the lintels were of coke-breeze concrete, and not of wood. Mr. Stenning also mentioned an experience of his own when staying at an hotel in Scotland, where he was awakened to find the corridor full of smoke. There was a special arrangement for breaking a glass door and obtaining a key of an "escape staircase" which would have led him directly into the seat of the fire; but, fortunately, he adopted the ordinary route, and came down by the main staircase quite safely, although at some inconvenience. Good wood beams seldom burned through. They would char, but remained serviceable for some time. Party-walls carried above the roof were certainly useful, especially in warehouses and factories. He did not think that any legislation could provide against loss of life by panic; but every reasonable facility for escape should, of course, be provided.

Mr. A. Vernon said that if a mathematician were to calculate the chances of loss of life by fire, he would probably multiply the density of population by the height of the buildings. In rural districts loss of life from fire was very rare. In towns the risk as regarded public buildings was multiplied by overcrowding and by difficulty of exit. In Chicago, which had, perhaps, the very greatest experience of fire, every house was, as far as possible, now protected from fire risk, and every facility was given for escape. Lifts were always dangerous, even more so than stairs, and he looked forward to the time when they would be banished to some exterior structure apart from the main building. Stone and iron, which seemed naturally the most fire-resisting materials, had both proved to be unreliable, and good hard timber was about the best friend the firemen had. The greatest church fires, or rather losses of life from panic resulting from fire, had been where the doors were insufficient and opened inwards only. To sum up the matter, flues must be well guarded: 4½in. was sometimes well enough, but was insufficient in the case of large stoves or furnaces for heating. Combustible materials must, as far as possible, be eliminated, and every door of a public building must be made to open outward.

Mr. C. John Mann asked whether Mr. Blashill could tell the meeting whether hollow brick walls, which so usefully kept out damp, contributed to danger in the case of fire?

Mr. Blashill, in reply, said he had chiefly addressed himself in the paper to the question of fire in relation to danger to life, for the subject was a wide one, and his time was limited. Property could be insured and reinstated, but life could not. He could hardly admit that the regulations of the County Council were harassing, and the very nature of things prevented them from being final. They must necessarily vary as circumstances varied. In London there had, fortunately, not been much recent experience of large fires in public buildings while the buildings were occupied; but it was the duty of the body for whom he acted to provide against the very worst that might happen. They published all their regulations so that everyone could understand them, and endeavoured to meet every case fairly and reasonably. As to cost, if cost was incurred which was unnecessary, the money was certainly wasted: but if cost could by any means be shown to contribute to the preservation of life, it could hardly be unnecessary. He agreed with Mr. Harston and Mr. Stenning, that many of the inflammable materials now or formerly used might be superseded. Wood lintels and wood bricks, for instance, were not now necessary. He was sorry that he could not answer Mr. Mann's question as to hollow walls, as he had no experience of their behaviour during a fire.

MUSEUMS OF THE SCIENCE AND ART DEPARTMENT.

THE Select Committee appointed to inquire into and report upon the administration and cost of the Museums of the Science and Art Department have agreed to the following first report :—

Since the issue of the report of the Museums of the Science and Art Department Committee in July, 1897, your committee have continued the inquiry, but reserve for a further report the publication of additional evidence with their final review and recommendations.

They feel, however, bound to report without delay certain conclusions at which they have arrived, on consideration of the evidence, as regards the South Kensington Museum and the Geological Museum in Jermyn-street.

They are unanimously of opinion that with a view to present efficient management, to economy of administration, to future development of the collections, and to their full use for the purpose of exhibition and of instruction, it is necessary:

1. That the whole area on the east side of Exhibition-road (except that occupied by the Royal College of Science, which will not be sacrificed except at great cost), be exclusively devoted to the Art Museum and the Art Library, with provision for the conduct of the business connected with loans of art objects and the art schools. They are satisfied that the whole of this space is required for the art schools, the due exhibition of the art collections, and the administration connected with such a museum.

2. That provision for the whole of the science collection, the science library, for loans of scientific objects, and for the science schools be made on the west side of the Exhibition-road.

They are convinced that this concentration of art on one side of the road and of science on the other is essential to good administration, to satisfactory results from the money expended, and efficiency both in the museum and in the schools This arrangement would allow space for the future development both of the art and of the science branches.

They also unanimously recommend that the Geological Museum in Jermyn-street be no longer occupied for the same purposes as now ; and that the collections there exhibited be removed to the west side of Exhibition-road and made part of the science collections.

BOOKS RECEIVED.

Architectural Photography, by G. A. T. Middleton, A.R.I.B.A., &c. (London : Hazell, Watson, and Viney, Ltd., Creed-lane, Ludgate Hill), is a small treatise on this subject, being a series of "practical lessons and suggestions for amateurs," which appeared in the *Amateur Photographer*. A great many young architects and tourists will find Mr. Middleton's instructions and advice all they need. Architecture hitherto has been rather shunned by the photographer, for the simple reason that unless care is taken to insure a good position for the camera and the right focus, and to obtain proper light and shadow on the building, the result is vexatious. Photographs of interiors are generally doomed to failure. A point of view is selected to avoid glare of light, and to get in all that is possible, with the result that the effect is disappointing. We have seen many church interiors, for instance, which show an uninteresting west view or a long vista of vault and arcade, taken centrally, one side in hopeless gloom, but the main features of the interior are left out. A diagonal view, as Mr. Middleton says, is often to be preferred. Pews, of course, are abominations for architectural effects, and wide-angle views are unnatural. Many useful hints and photographic examples are given, and the book is a useful introduction to the subject. Some of the street views are interesting examples of the art.——*Sanitary Engineering*, by W. Paul Gerhard, C.E. (New York).—Mr. Gerhard, whose works on sanitary subjects we have often noticed, discusses in this little book the subject of sanitary engineering, a lecture delivered by the author before the Franklin Institute of Philadelphia some time ago. Mr. Gerhard defines sanitary engineering, and describes what ought to be the basis of the sanitary engineer's education. Many practical hints and suggestions are given on a variety of subjects: water supply of cities and dwellings, sewerage, sewage disposal, street pavements, cleansing footways, refuse removal, laying-out cities, and a variety of other cognate subjects, into which we cannot here enter. Sanitary engineers and students will gain much from the perusal of this work, and of the many requirements of the profession.——*Bell's Cathedral Series : Hereford* (London: George Bell and Sons).—The present monograph has been written by Mr. A. Hugh Fisher, who expresses his indebtedness to the studies by the Rev. Francis Havergal, and Dean Merewether's exhaustive "Statement," published in 1841, and the Rev. H. W. Phillott's "Diocese of Hereford." The building is one of our smaller cathedrals, and was terribly mutilated, in the 18th century, by Bishops Bisse and Egerton, and the arch-vandal James Wyatt, but still contains much interesting work of the Norman, Early English, and Decorated periods. It is inconceivable that until the present day no successful effort has been made to replace, by a more worthy construction, the Carpenter's Gothic stucco-lined west front constructed by Wyatt. The little work before us is illustrated with forty reproductions of photographs and old prints, and also contains a plan. These guide-books, of which the present is the eleventh published, are tersely written, convenient in size and shape, well bound and illustrated, and reasonable in price.——The quarterly issue of the *Essex Review* (Chelmsford : E. Durrant and Co.) contains an illustrated article on "The Essex Marshlands," by F. Carruthers Gould, and also some interesting notes on "The Essex Taylors" (Isaac, Ann, and Jane), by Ewing Ritchie, and an account of Felsted School, a drawing of which, by G. S. Hodgson, forms a frontispiece to this well-edited county journal.——The quarterly *Report* of the Palestine Exploration Fund is freely illustrated with process blocks ; the chief features are articles on recent discoveries in Jerusalem by Dr. C. Schick, "The Home of Samuel" by M. Lucien Gautier, and "Hebrew Names in Inscriptions from Babylonia" by Theophilus G. Pinches.——*Norton-sub-Hamdon*, in the county of Somerset, by Charles Trask (Taunton: Barnicott and Pearce, Athenæum Press). The author of this volume deals with the parish of Norton, situated in the southern division of Somerset between Crewkerne and Ilchester. The discovery of hut circles on Ham Hill led to the history of the hill. The church is a fine edifice, with a good example of a Somerset tower. Mr. Trask gives an account of the parish, manor, church, rectory and rectors, parish registers, personal matters, and his work is illustrated by maps, photo-views of the entrenchments on Ham Hill, and old houses. The work is of interest to topographers and antiquaries of this part of the country.

The statue by Mr. John Cassidy, of Manchester, of the late Ben Brierley, in front of the museum in Queen's Park, was unveiled on Saturday. The statue is in Portland stone, and is considerably larger than life-size. It represents the dialect writer in modern dress, standing, the left arm raised and the right hanging by his side. In the left hand he holds some leaves of manuscript, and his right hand rests on the papers which he has just put down on a block of stone.

The new reservoir for the Bath Corporation at Monkswood has been finally completed, and now contains 31ft. of water. It has been constructed by Messrs. Neave and Son, under the direction of Mr. W. Fox, C.E.

Mr. Orchardson, R.A., has been intrusted with commission to paint the memorial portrait of Lord Kelvin which it is proposed to place in the library of the Royal Society at Burlington House.

The Crosthwaite Schools, Keswick, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The west window for Hawarden Church, to be erected by the members of the Gladstone family to perpetuate Mr. and Mrs. Gladstone's long and happy connection with Hawarden, is approaching completion, and will soon be placed in position. The subject will be the Nativity, from the designs of Sir Edward Burne-Jones.

The twelfth annual dinner of the Auctioneers' Institute of the United Kingdom will take place at the Hotel Cecil, London, on Friday in next week, May 13th, under the presidency of Mr. James F. Field.

The scheme of the Blackpool Sea-water Company, for the erection of a pier at the north end of Blackpool, and the provision of additional pumping facilities in connection with it, was rejected on Friday by a committee of the House of Lords.

OBITUARY.

Mr. Philip Hermogenes Calderon, R.A., the Keeper of the Royal Academy, died on Saturday from complications following repeated attacks of influenza. Calderon was boro, of Spanish parentage, at Poitiers in 1833, and was trained as an artist in Paris and London. He soon came to the front, devoting himself to popular *genre* subjects, and became an A.R.A., at 31, while at the Paris exhibition of 1867 he obtained the first medal given to English artists. In the same year he became a full Academician, and in 1878 he obtained a first-class medal in Paris and the ribbon of the Legion of Honour. Among chief works are his diploma picture "Whither?" an "Œnone," and the "Aphrodite," first shown at the Grosvenor Gallery. In 1887 Mr. Calderon was elected Keeper of the Royal Academy in succession to Mr. F. R. Pickersgill. The keeper has a house within the Academy precincts, and is the official head of the schools. From the period of his election he found less time for painting, and of late years he did not often exhibit. One of his sons—Mr. Frank Calderon—is well known as a painter, chiefly of animal subjects.

Mr. Charles Green, one of the most popular members of the Royal Institute of Water-Colour Painters, died on Sunday last at his residence at Hampstead. Born in 1840, he learnt his art at one of the Newman-street studios, and afterwards from Mr. J. W. Whymper. He early made his mark as an illustrator, became a member of the Institute when it was still housed in Pall Mall, and was one of the most energetic of those who brought about its great development when it moved to Piccadilly. Mr. Green was an authority on Georgian costume and furniture, and will best be remembered as the humorous and accomplished illustrator of Dickens's creations.

Mr. Nathaniel Tertius Lawrence, the head of the firm of Lawrence, Graham, and Co., solicitors, of 6, New-square, Lincoln's Inn, which, under varying names, has been in existence from the 16th century, died on Friday evening at his town residence, 44, Westbourne-terrace. He was one of the oldest solicitors in practice in London, having been admitted in Hilary Term, 1848. On all questions relating to the transfer of land he was a leading authority in the profession, as for many years he devoted much labour and attention to the subject. He assisted in drafting the Conveyancing Acts of 1881 and 1882, the Settled Land Acts from 1882 to 1887, as well as other Acts of Parliament respecting land transfer.

CHIPS.

The formal opening of a new central school for Pitlochry took place on Monday. The building, which is one story in height, contains accommodation for 620 pupils, and has cost about £6,000.

The date of the opening of the Exhibition of Works of the French School at the Guildhall Art Gallery is now fixed for Saturday, June 4, its postponement to that date having been necessitated by the ill-health of Mr. Temple, the director of the Gallery.

The Lymington (Hants) Board of Guardians have been notified of the approval by the Local Government Board of the proposed extensions and alterations at the workhouse, for which plans were prepared by Mr. I. Pym Jones, architect, of Lymington.

The interesting old tower of SS. Cattwg and Illtyd's Church, Neath Valley, Glamorganshire, is about to be restored, under the supervision of Mr. C. B. Fowler, F.R.I.B.A., of Cardiff. The battlements were bodily taken down some 30 years ago, and an unsightly erection put up above corbel table. It is intended to remove this and rebuild the upper portion on the old lines of the towers of the district. It is also contemplated to add three new bells to the existing three, making a peal of six. Mr. W. A. James, of Cowbridge, is the contractor who has been intrusted with the work.

A fund is being raised for assisting the widows, orphans, and relatives of the workmen killed and those more or less disabled by the collapse of the concrete roof at Abbey Mansions, at the corner of Orchard and Victoria-streets. As at present ascertained, seven wives, four parents, 16 orphans, and ten other children of various ages have to be relieved or provided for. It is believed that not less than £3,000 will be required, and towards this about £300 only has been as yet promised. The hon. secretary is Mr. H. H. Montague Smith, 28, Victoria-street, Westminster.

Building Intelligence.

ACTON.—Mrs. Creighton, who was accompanied by the Bishop of London, opened, on Wednesday the Passmore Edwards Acton Jubilee Cottage Hospital, situated in Gunnersbury-lane. With the hospital are combined a nursing institute and invalid kitchen. The building has been built from plans by Mr. Charles Bell, F.R.I.B.A., at the expense of Mr. J. Passmore Edwards, at a cost of £2,500, and Lord and Mr. Leopold de Rothschild gave the site. About £1,300 has been contributed in the district for fittings, &c. The hospital consists mainly of a ground-floor story. The chief wards are at each side, one for males and the other for females, each containing four beds and a cot. Adjoining each there is a separate ward for one bed, with the necessary offices: there is a room for the matron, a day-room for nurses, and dispensary. Above are seven apartments available for bedrooms, or as special rooms for patients.

BIRMINGHAM.—The Hen and Chickens Hotel and Café is in course of erection in New-street, between the Grammar School and Lloyds' Bank. The building, which, with its equipment, has cost £20,000, rises 60ft. above the street level, while the floor of the sub-basement is 25ft. below. The site has a frontage of 48ft. and a depth of 50ft., with an extension of 15ft. under the school premises for the sub-basement. The building rises to a height of five stories and a mansard. The architect is Mr. J. A. Chatwin, and Messrs. James Moffatt and Son are the builders. The facing materials are Aberdeen granite and red terracotta, and the treatment is a development of the Tudor style. A feature of the hotel is an octagonal corner tower, which rises from the level of the first floor on a splayed pier of polished Aberdeen granite, is broken by a series of oriel windows, and is surmounted by a short spire. The upper portion of the façade towards the street is broken by a central series of projecting oriel windows, terminating with a gable in front of the high-pitched roof. The hotel proper commences on the first floor, where are the commercial-room and the drawing-room. Behind is the coffee-room, while farther back are a smoke-room, serving-room, and lavatories. The second, third, and fourth floors contain the visitors' bedrooms, 48 in all, and each containing a fireplace. In the mansard are sitting-rooms and dormitories for the staff. The main staircase is of granite, with a wrought-iron balustrade, and it is lighted by windows of cathedral glass. The artificial lighting throughout the hotel is by electricity, from the mains of the Electric Supply Company, and the building is ventilated by exhaust-fans, driven by electricity, which also supplies the power for working the lift, &c.

CARDIFF.—In the sanctuary of St. Peter's Roman Catholic Church, Cardiff, through the generosity of the Marquis of Bute, the old wooden rood-screen has been replaced by a screen of Caen stone. The screen requires for its completion the crucifix with the accompanying figures of the Mother of Sorrows and of St. John, three large statues of the patron saints of the church, and four smaller statues of the patrons of England, Scotland, Ireland, and Wales. There are four slender buttressed piers with face shafts and canopied niches resting on moulded bases of Pennant stone, and from these there spread three arches of Caen stone. These arches spring from the caps of the clustered side-shafts, which are of polished African marble, and springing from the piers between the arches gablets of Caen stone with flowing tracery extend over their cornices. Each gablet terminates in a pedestal, that of the main arch being for the rood, and those of the side arches for the Mater Dolorosa and St. John. When the rood, which is to be 8ft. in height, is supplied, the structure at its highest point will stand 38ft. above the floor of the nave. Its width is 28ft. Below the caps of each of the gablets the carved and bracketed finials of the crocketed arch labels are also surmounted by pedestals to bear statues of the patron saints of the church. The cusps of the arch mouldings looking east and west are furnished with double sets of carved heads representing the Apostles and certain saints. The design is in Late Gothic, and the architect is Mr. Williams Gardner, of Newport, Mon., the contractor being Mr. James Pearse, Great Brunswick-street, Dublin.

SANDHOE, NORTHUMBERLAND.—Sandhoe House, at one time the seat of the late Sir Rowland Stanley Errington, is to be occupied in the course of a few weeks by its present owner, Col. Hornby, and the fabric, which is mainly of the Elizabethan period, is now undergoing extensive alterations and repairs. It has been unoccupied for the last five or six years, its last tenant being the late Hugh Fenwick, and the work of putting it in order for the new tenant has been intrusted to Mr. E. Darlington, of Hexham, the architects being Messrs. Jos Potts and Sons, of Sunderland. The theatre or ballroom, which comprised one wing of the building, has been entirely demolished, as has also the brewhouse, which formed another wing of the building. New fireplaces have been inserted in all the rooms—some 40 or 50 in number: all the floors on the ground floor have been relaid, and sundry other alterations and improvements have been carried out. The lawns, terraces, and fancy flower plots, which were at one time noted for their unrivalled beauty, are likewise being well attended to.

WOMBWELL.—The first section, consisting of nave and aisles of the new parish church of St. Mary, Wombwell, was consecrated by the Bishop of Beverley last week. It occupies the site of the old church, which was in the last state of decay. The new nave is 90ft. long, with a clear width across of 53ft., and the height of the roof is 40ft. The aisles are divided from the nave by arches of Bath stone, and there are large clerestory windows. In the chancel arch an oak altar has been placed with altar dorsal and hangings, and at either side the arms of the Archbishop and See of York are carved. On the north stands a pulpit, having a vase of Dove marble and a marble capping. In the three front panels the Transfiguration of our Lord is carved. Mr. C. M. Hatfield was the designer, and Messrs. Boulton and Sons, of Cheltenham, executed the work. The same firm also carved the font, which, with the oak altar, is also a special gift. The church floors are laid with wood blocks, and the aisles are paved with marble mosaic. The church is designed in the style of the South Yorkshire churches erected at the close of the 15th century. The building is warmed by the low-pressure hot-water system, by Haden, of Manchester. The contractor is Mr. George Webster, of Sheffield, and the architects were Mr. Charles Hadfield and Mr. A. R. Garland, of the same city. Mr. F. Cook, of London, has acted as clerk of the works.

The bridges committee of Glasgow Town Council have resolved to recommend the erection of a new swing bridge across the Clyde at Oatlands Ferry, at a cost of £15,000.

A joiner named Henry Pratley, of Harrow-road, won a verdict for £85 under the Employers' Liability Act at Marylebone County-court, on Monday, for the loss of three fingers, caused by the negligence of a foreman at the works of Messrs. Godson and Sons, builders, of Kilburn, while working a circular saw.

The small church at Yiewsley, designed 30 years ago by the late Sir Gilbert Scott, consisting of a nave, apsidal chancel, and vestries, being inadequate to present requirements, has been converted into a north aisle and chapel attached to a large new nave and chancel erected on the north side of the original fabric. Messrs. Nicholson and Corlette are the architects of the new work, which has been carried out by Messrs. Fassnidge and Son, of Uxbridge, the builders of the original fabric. The cost has been under £4,000.

A faculty has been granted for restoring the parish church of Trimley St. Martin, near Felixstowe. The works will include the erection of a new roof of pitch-pine, the removal of a lath-and-plaster ceiling, and the erection of a new chancel in place of one of deal, painted to imitate marble, and erected by the parish carpenter 18 years ago.

The Princess Louise, Marchioness of Lorne, has designed and will superintend the execution of a statue of the Queen for the Manchester Cathedral. The statue, which is life-size, will be placed over the western porch. It is intended as a memento of the visit of her Majesty to the Art Treasures Exhibition in Manchester in 1857, and it represents the Queen simply robed, in accordance with her age at that time, and with sceptre in hand. The western entrance and porch of the cathedral are now practically completed, and the necessary funds have been fully subscribed.

It is announced from Athens that Mr. F. C. Penrose, F.R.S., the distinguished past surveyor of St. Paul's, is again on a visit to that city. Mr. Penrose, who is now in his 83rd year, is superintending the works in progress for the better security of the Parthenon.

Engineering Notes.

INSTITUTION OF CIVIL ENGINEERS.—The council of this institution have made the following awards for papers read and discussed before the institution during the past session:—Watt Medals and Premiums to Messrs. H. L. Callendar and J. T. Nicolson; a Telford Medal and Premium to Mr. A. H. Preece; George Stephenson Medals and Premiums to Messrs. Whately Eliot and W. O. E. Meade-King; a Crampton Prize to Mr. E. W. Anderson; Telford Premiums to Messrs. L. B. Atkinson, Henry Fowler, and W. L. Strange. The presentation of these awards, together with those for papers which have not been subject to discussion and will be announced later, will take place at the inaugural meeting of next session.

THE PROPOSED NEW BRIDGE AT KEW.—A Select Committee of the House of Commons unanimously approved on Tuesday the preamble of the Kew Bridge and Approaches Bill, which provides for the erection of a new bridge at Kew in place of the existing one. The only opposition was from the West Middlesex Water Company, which claimed the continuance of their present statutory power (as yet never exercised) to carry their mains across the bridge. The committee decided that a clause prohibiting the company from carrying their pipes across the new bridge without the consent of the Middlesex and Surrey County Councils should be retained; but they directed certain new clauses to be prepared to protect the company's mains. The present stone bridge was erected in 1788. It is unfortunately very narrow, being only 18ft. wide in the roadway and 3ft. footway on each side. There is also a very dangerous gradient on the Middlesex side of 1 in 15, and on the Surrey side of 1 in 17, and the seven arches with six piers in the river are an impediment to the increasing river traffic. The new bridge has been designed by Sir J. Wolfe Barry and his partner (Mr. Chas. A. Brereton). It will be a stone structure of three arches, with two piers in the river, and will be 48ft. wide, with a 30ft. roadway, and a footpath of 9ft. wide on each side.

CHIPS.

The town council of Stirling have appointed Mr. Andrew H. Gondie, assistant master of works at Paisley, as master of works for the burgh in the stead of Mr. F. C. Holmes, who has been appointed burgh surveyor of Govan.

The Mersey Docks Board, at their last meeting, decided to construct a passage of 90ft. wide, with gates leading to the proposed new branch dock, on the site of the southern portion of the Sandon Dock, at an estimated cost of £12,000. It was also decided to widen certain sheds at the Victoria Dock at an estimated cost of £1,350.

The sale of the Renton collection of modern pictures and water-colour drawings at Christie's, on Saturday, realised about 22,000 guineas. The "Order of Release," by Millais, fetched 5,000 guineas, the purchaser being Mr. Henry Tate, who proposes to add it to the collection in the National Gallery of British Art; the "Black Brunswicker," by the same artist, realised 2,650 guineas; while "Afternoon Tea," also by Millais, was sold for 1,300 guineas.

The foundation-stone of the chapels at the new cemetery which is being formed at Brandwood End, King's Norton, by the King's Norton Rural District Council, was laid on Saturday afternoon. Mr. F. Brewin Holmes is the architect, and Mr. E. J. Charles the builder. The cemetery covers an area of 31 acres, of which 13 acres are now being laid out. The total cost of the undertaking is £16,000.

The trustees of the Chantrey Bequest have purchased Mr. Melton Fisher's "In Realms of Fancy," Mr. Ralph Peacock's "Ethel," Mr. Herbert Draper's "Lament for Icarus," Mr. Glendinning's "Haymaking," a water-colour; and Mr. Yeend King's "Milking-Time."

The foundation-stone of new public baths at Grangetown, Middlesbrough, was laid on Saturday afternoon. The building will consist of a swimming bath and slipper baths, with the bathman's and caretaker's house above, and a public washhouse and laundry. The slipper baths are the portion now in course of erection, and these will form the central part of the building. The land has been given by Messrs. Bolckow, Vaughan, and Co., and the cost of the building is entirely defrayed by Mr. James Eadie, of Derby. The contract for the whole of the work has been let to Messrs. Bastiman Bros., of Middlesbrough, for £1,736. The architect is Mr. Mitchell Bottomley, of Middlesbrough and Leeds.

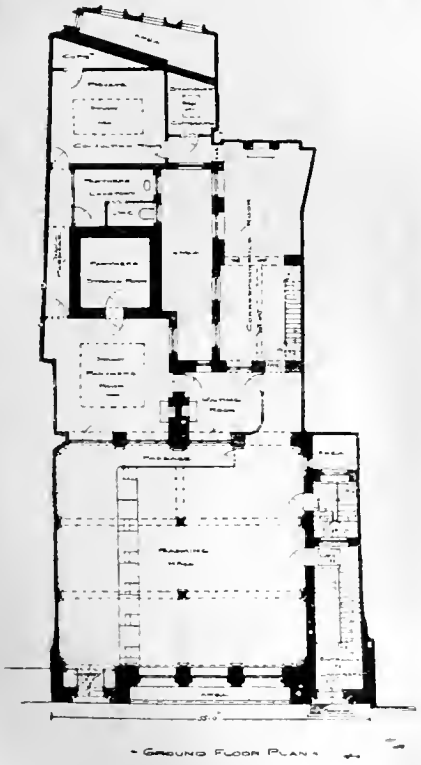
MESSRS. BARCLAY AND COMPANY'S BANK, FLEET STREET.—SOLENT YACHT CLUB, YARMOUTH, ISLE OF WIGHT.—COTTAGE HOMES OF THE LINEN AND WOOLLEN DRAPERS' INSTITUTION, MILL HILL.—STUDIES OF ANIMAL LIFE, TREATED FOR DESIGN.—LISIEUX CATHEDRAL.

Our Illustrations.

MESSRS. GOSLINGS' BANK.

THE new building about to be erected for Messrs. Barclay and Co., Limited, will stand on the site of the premises which have been occupied by the firm of Goslings and Sharpe for some generations past, the latter firm being now amalgamated



GROUND FLOOR PLAN.

with Messrs. Barclay and Co. The demolition of the old house and erection of the new building have been rendered necessary by the increase of business since the amalgamation. The accommodation will consist, as indicated by the ground-plan, of a spacious banking hall, of the full width of the site, except for an entrance and staircase for access to the upper floors, together with the usual directors' and waiting-rooms, &c. The first floor will contain a large and light suite of offices, while the two upper floors will be occupied by the bank manager as a residence. The front will be entirely of Portland stone. The drawing herewith illustrated is now on view at the Royal Academy.

SOLENT YACHT CLUB, YARMOUTH, ISLE OF WIGHT.

THE architect of this building, which has been erected for the Solent Yacht Club, is Mr. Aston Webb, F.S.A.

THE COTTAGE HOMES OF THE LINEN AND WOOLLEN DRAPERS' INSTITUTION.

THESE buildings are now in course of erection on the southern slope of Mill Hill, Middlesex, on a beautiful site given by Mr. James C. Marshall. The scheme provides for fifty-four homes for pensioners of the institution, and many firms and private individuals interested in the trade have given one or more of the buildings. The central block contains a large hall with an open-timber roof and an oriel window, a small meeting-room, warden's apartments, &c., and has been built by the Marshall family in memory of the late Mr. James Marshall, of Goldbeaters, Middlesex, and Vere-street, W., and Mr. John Snelgrove and Mr. J. C. Marshall have each erected one of the wings, containing together eight dwellings. The other donors are: Mr. Alfred Brown, J.P., Mr. Wyndham F. Cook, Mr. Fred. Crisp, J.P., Messrs. Hitchcock, Williams, and Co., Mr. Peter R. Jones, Mr. William P. Jones, Mr. Howard Morley, Messrs. I. and R. Morley, Mr. Owen Owen, Mr. M. H. Rackstraw, Mr. J. R. Roberts, J.P., Mr. T. R. Roberts, Messrs. J. Rotherham and Co., Mr. John Scott, J.P., Sir George Williams, and the Smoking Concert Committee. The works are being carried out by a local builder, Mr. William Tout, of Hendon, under the superintendence of the architect, Mr. George Hornblower, A.R.I.B.A., of No. 2, Devonshire-street, Portland-place, W., whose designs were selected in a limited competition. The drawing we illustrate is in this year's Royal Academy Exhibition.

STUDIES IN ANIMAL LIFE, TREATED FOR DESIGN.

CONTINUING our series of plates of Birds and Beasts, drawn with a view to their application to decorative purposes, we to-day publish some clever studies for which a National Silver Medal was awarded last year to Mrs. M. E. Dawson. These include the great-eared owl, the painted quail, the double-spurred francolin, some rabbits, the head of a running hare, the barn owl, and the painted francolin. The several subjects are characteristically handled with skill and appreciation on the part of the artist, so that her studies will not fail to be valued by our artistic readers.

LISIEUX CATHEDRAL, FRANCE.

LISIEUX has been well termed "the Chester of France," on account of its many and famous old timber houses erected in delightfully quaint streets, picturesquely grouped in rambling irregularity, in the valley of the Orbiquet and Touques. Everyone who can makes a visit, of course, to this charming old city, and its buildings are more or less represented in every architect's sketchbook. The former cathedral is a very remarkable and delightful building, perhaps the most interesting specimen of Transitional to be found in the whole of Normandy. In size it has many superiors, and in richness of detail it is excelled by other churches. Its west front is severe in design and simple in its parts. On plan the building takes the form of a Latin cross, enriched by radiating chapels, and over the crossing is a lantern tower of 13th-century date. A simple range of lancet-windows surrounds the building at the clerestory level. The fabric was commenced in 1045, but was burnt in 1136. The rebuilding began in 1141, and was finished some forty years later. Enlargements were made in 1218, but another fire damaged the building in 1226. Seven years after that date the completion of the whole structure was realised. The church, as it stands, is a pure and harmonious example of its time. Against the north wall of the transept are two 12th-century tombs. Behind the sanctuary is the Chapelle de la Vierge; it is paved with ancient gravestones, and was built as an expiatory offering from Bishop Pierre Cauchon, the wicked judge of Jeanne d'Arc, who had been expelled from his former bishopric of Beauvais by his diocesan. Lisieux had a line of bishops of its own, from the 6th century to the present century, when the see was suppressed. Henry II. of England was married to Eleanor of Guyenne in this building. We are indebted to the *American Architect* for the sketch given herewith to-day.

COMPETITIONS.

SOUTHEND.—Mr. J. M. Bryden has made his award as assessor on the competitive designs for the proposed new buildings, consisting of town-hall and corporation offices, fire brigade station, and technical and science schools, with provision for space for the subsequent erection or provision for gymnasium, free library, and police-station and court-room. The successful competitor is Mr. H. T. Hare, associated with Mr. Thomas Davidson, of London. The assessor says that the estimated cost is rather low, but there is little doubt it can be carried out within 10 per cent. of the amount named by Mr. Hare, or about £45,000. The council have postponed definite action until their next meeting.

CHIPS.

In the House of Lords, the Crowhurst, Sidley, and Bexhill Railway Bill has passed the Earl of Morley's Committee.

At Southwark Police-court, on Friday, James Carmichael, builder, of Wandsworth, was summoned for beginning the foundations of a new building without having given seven days' notice to the Bermondsey Vestry. The magistrate fined the defendant £5, with further penalties of 10s. a day for 56 days, and the cost of the summons, making £33 2s. in all.

Giving evidence before the Royal Commission on the London Water Supply, on Monday, Sir A. Arnold, formerly chairman of the London County Council, declared that there was ample scope in that body for undertaking the administration of the water supply. Dr. Shirley Murphy, medical officer of health for the administrative county of London, held that the water-owning authority and the disease-preventing authority ought to be the same. The enteric death-rate of London was at present very low, and the virus was very feeble, but it might become more dangerous and difficult to deal with in future. The Commission adjourned till next Monday.

Mr. William Quarrier's Consumption Hospital at Bridge of Weir being now completed and on the eve of receiving patients, was, on the invitation of the Medical Advisory Board, inspected on Saturday by members of the medical profession in Glasgow and district. The institution is for females, and will accommodate 36 patients. It has cost £25,000, and further extensions are proposed.

The London School of Medicine for Women in Hunter-street, Brunswick-square, W.C., was informally opened on Monday. It has been rebuilt from plans by Mr. J. M. Bryden, F.R.I.B.A., the contractors being Messrs. Holloway Brothers, of Victoria Works, Battersea. We illustrated the new school in our issue of Dec. 17, 1897.

As announced by Sir E. Poynter at the Royal Academy banquet, the portrait of Mr. Gladstone painted in 1879 by Sir John Millais has been presented to the nation by Sir Charles Tennant. Its ultimate destination will probably be the National Portrait Gallery. The portrait was painted for the Duke of Westminster, who sold it during the progress of the disruption of the Liberal party caused by the introduction of its first Home Rule measure. It is at present on view at the West Ham Free Picture Exhibition in the Town Hall, Stratford, which closes to-morrow (Saturday).

In connection with complaints of the nuisance caused by the Brighton refuse destructor, the works committee of the town council have decided that Major Hector Tulloch, R.E., of Victoria-street, Westminster (late chief engineering inspector of the Local Government Board), and Mr. S. H. Terry, M.Inst.C.E., M.Inst. Mechanical Engineers, of Victoria-street, Westminster (formerly an inspector of the Local Government Board), be retained on behalf of the corporation to inspect the destructor and report to the committee whether there are any defects in its construction or working, and, if so, what are the best-known means which can be adopted for preventing any nuisance or annoyance from the works.

In the Queen's Bench on Friday, Miss Jervis Smith, Brooksford Hall, Doveridge, near Derby, obtained £555 damages and costs against a Weybridge builder named Greenfield, in respect of a broken arm sustained by the fall of a greenhouse cistern, which defendant had fixed at her aunt's house. Mr. Justice Day observed that there had been gross and childish negligence on the part of the defendant.

During the past week no property of importance was offered at the Tokenhouse Yard Mart; but there was a keen demand for ordinary investments. Several lots of building land were offered, one estate of eleven acres in a north-east suburb selling at £700 per acre. The total sales amounted to £157,200, which is £105,525 in excess of the corresponding week last year.

•• LISIEUX • CATHÉDRAL • FRANCE ••

PROFESSIONAL AND TRADE SOCIETIES.

BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.—The annual meeting of this body will be held at Southampton on May 24 and three following days. On Tuesday, May 24, the proceedings to be opened by the Mayor welcoming the association to Southampton. A business meeting will follow, and many practical papers will be read. On Wednesday, May 25, a business meeting will be held in the morning. After luncheon, the members will visit the works of the South Hants Waterworks Company (wells, headings, pumping-station, and softening works on the subsiding system). The annual dinner takes place in the evening. On Thursday, May 26, business in the morning. After luncheon, a visit will be paid the Southampton waterworks. On Friday, May 27, the members will visit the Portsmouth waterworks and the Gosport Waterworks.

GLASGOW MASTER WRIGHTS' ASSOCIATION.—The thirteenth annual meeting of this association was held on Thursday evening in last week, within the Building Trades' Exchange, Mr. Hugh M'Taggart, president, in the chair. The directors' report and financial statement were submitted by the secretary, Mr. James L. Selkirk, C.A. The report stated the association was now stronger in point of numbers and influence than ever it had been before, and that the directors had been increasingly serviceable to the members in advising them on questions of difficulty with architects and proprietors. The relations with the operatives continue to be satisfactory. The financial statement showed a credit balance of £38 15s. 11d. Office-bearers were appointed, Mr. James Ferguson (Messrs. Ferguson and Anderson) being elected president; and Mr. James L. Selkirk, C.A., re-elected secretary and treasurer. Mr. Joseph Somerville, City Saw Mills, thereafter read a paper on the structure, growth, and description of some of the chief timber-yielding coniferæ. Mr. Somerville emphasised the importance of a scientific knowledge of the structure of timber in a healthy condition, in order to prevent or cure the diseases—such as dry rot, &c.—to which it was subject. The difference between the pines, spruces, and firs was described. Mr. Somerville suggested a theory, which seemed to be borne out by experience, as to the leaves—namely, that the greater the number of leaves in a bundle the tree had, the wood from that tree would be better and more durable than that from those with few leaves in a bundle, or solitary leaves. He instanced the larch, which had a great many leaves in a bundle, as a good, durable wood in comparison with the Scots pine, with two, or the silver fir, with solitary leaves. The trees producing the chief timber of commerce were then described in detail, including the Scots pine, the Canadian yellow pine, pitch-pine, Baltic whitewood, Oregon pine, Californian redwood, and Kauri pine. The paper was illustrated with diagrams, microscopic sections, and specimens of the wood and leaves of the different coniferæ.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—The annual general meeting of the Institute was held on Monday night, at 9, Conduit-street, W., the chair being occupied by Mr. H. L. Florence, vice-president, and the total attendance numbering just twenty-four. The gist of the annual report, which formed the main feature of the discussion, and was eventually adopted, was published by us last week (p. 596). The accounts showed that the balance of income over expenditure during 1897 had been £1,116 11s. 1d. Prior to the general meeting a special meeting was held for the purpose of confirming resolutions relative to some alterations in the by-laws passed at the meeting held on Monday, April 18th, and detailed in our issue of the 22nd ult. (p. 553). It was resolved to admit to alliance, under by-laws 77-81, the Aberdeen Society of Architects.

The Duke of Norfolk has sold The Farm, his Sheffield residence, and a large portion of his grounds, to the Midland Railway Company, the property being required for the enlargement of the Midland station.

A convalescent home for workpeople was opened at Horsforth, near Leeds, by the Lord Mayor of the latter city on Saturday. The building consists of two semidetached stone-faced villas, transformed to the new purpose from plans by Mr. Walter A. Hobson, of Leeds. Accommodation is provided for 32 patients and an administration staff.

WATER SUPPLY AND SANITARY MATTERS.

MANCHESTER SEWAGE TREATMENT.—The Rivers Committee of the City Council met on Friday to decide what sum should be borrowed for treating the city sewage at Davyhulme on the bacterial system. It was agreed to ask the sanction of the Local Government Board to the borrowing of £160,000. This sum, it is estimated, will be required for 37 acres of bacteria beds and the purchase of the necessary land for aëration purposes.

SOUTHWARK AND VAUXHALL WATER BILL.—The Select Committee of the House of Commons engaged in the consideration of the scheme of the Southwark and Vauxhall Waterworks Company for the construction of new storage reservoirs between Sunbury and Molesey Locks, for the abstraction of additional water from the river Thames, for the raising of new capital, and for other purposes, resumed their inquiry on Monday. Mr. James William Restler, C.E., said he had been engineer to the Southwark and Vauxhall Waterworks Company for 15 years. He asserted that the bulk of their water was taken from the Thames at Hampton, and a small quantity from wells at Streatham. In 1882 the company commenced at their own instance to give a constant supply of water to their district, and now 93·68 per cent. was under a constant supply. The proposed reservoirs would contain 1,076,000,000 gallons, or storage for 120 days. The total storage capacity of the company's works would be 1,539,000,000, and calculating their supply at 40 gallons per head per day, they would have a supply for 120 days up to the year 1911. The company were now asking for power to supply 45 million gallons per day, which was absolutely necessary to enable them to cover the daily demand of 43 million gallons. The company were not to be allowed to take any water for their extra supply unless 180,000,000 gallons were flowing past Molesey Lock. That they proposed should be the minimum. If the flow fell below that they proposed that they should equalise their supply by taking the water from the storage reservoirs. The 180,000,000 gallons flowing past Molesey would give a flow of 200,000,000 gallons at Teddington. To fix the point of gauging at Penton Hook instead of at Molesey would be to allow something like 53,000,000 gallons of water to pass the company's intake per day uselessly. Mr. R. S. Middleton, C.E., also gave evidence. Mr. James Mansergh, C.E., of Westminster, who was examined on Tuesday, stated that he had been a member of the Royal Commission over which Lord Balfour of Burleigh had presided, to inquire into the Metropolitan water supply in 1892 and 1893. He had designed and was carrying out the largest waterworks in this country—the great Birmingham scheme for bringing water from the Welsh hills to Birmingham. He had considered the proposed works and approved of them. The only important point was the quantity of water flowing over the weir at Teddington, and 200,000,000 gallons in his view was an ample flow at that point. There was nothing in the Bill contrary to the spirit of the report of Lord Balfour of Burleigh's Commission. In reply to the chairman, Mr. Johnson Ferguson, witness said he thought that the Grand Junction, the Lambeth Company and the other companies would have to come to Parliament in a few years for similar powers to those the Southwark and Vauxhall Company was now applying for. There should be an arrangement by which the water should be measured, so as to see that no one company took more from the river than its fair share. Mr. George Henry Hill, C.E., who was also a member of Lord Balfour of Burleigh's Commission, and who had carried out the Manchester and Glasgow water schemes, gave similar evidence.

STAINES RESERVOIRS.—The initial step towards carrying out the powers conferred in 1896 upon the New River, the West Middlesex, and Grand Junction Water Companies for the construction of reservoirs for their joint use at Staines, was taken on Saturday afternoon, when Mr. E. Boulnois, M.P., chairman of the joint committee, cut the first sod of the new works. Each company is practically responsible for one-third of the cost, and has a right to one-third of the additional supply, amounting to 35,000,000 gallons daily, or to 45,000,000 gallons under emergency. The maximum quantity allowed to be taken from the river for supply and for filling the reservoirs is restricted to 100,000,000 gallons in any one day of twenty-four hours. The committee can only take at Bell the surplus water above a flow of 265,000,000 gallons daily, which is equivalent to 361,000,000 gallons daily at Teddington, and this, after providing for the statutory quantity of 130,000,000 gallons which the companies have a right to take between Sunbury and Molesey, leaves 234,000,000 gallons daily to flow at Teddington. The intake from the Thames is to be on the Middlesex bank, about 300 yards below Bell Weir, and here sluices and a sluice-house will be constructed. The first length of the conduit will be closed for about 350 yards, and will be siphoned under the Colne brook, where it will become open. It will pass under the Great Western and London and South-Western Railways and the Wyrardisbury river through siphons, skirt Staines Moor, be again siphoned under the Colne, then run between the Linoleum Works and Hammond's Farm to the pumping station, which is to be situated near the Billet Bridge which carries the London road over the river Ash. The pumping machinery will consist of five triple-expansion surface-condensing Worthington pumping engines, each capable of delivering 16,000,000 gallons daily. The water will be delivered into the reservoirs through two riveted steel mains 6ft. 3in. diameter, joining into a steel pipe 8ft. 5in. diameter near the reservoir. The works have been designed by Messrs. Hunter and Middleton, Victoria-street, S.W., and will be carried out by Messrs. John Aird and Sons.

CHIPS.

The Brighton Sanitary Committee have instructed the borough surveyor to bring up amended plans and estimates for the artisan's houses to be erected on the Lewes-road site.

A disastrous fire occurred at the extensive timber yard of E. and D. Maginnis, contractors, Bolton, on Saturday morning. The outbreak originated in a stove, and the flames spread rapidly to the boiler-house, engine-room, and store department, all being wrecked. A large portion of the works were saved, also valuable adjoining property; still, the damages are heavy, much stock being destroyed.

The Brighton borough engineer and surveyor has submitted to the works committee of the corporation a report on Volk's electric tramway. It will be necessary to reconstruct one portion of the line on piles to the southward of the widened Madeira-road, the cost of this to Mr. Volk being estimated at £1,500. The committee consider this a seasonable opportunity for re-considering the existing arrangement between Mr. Volk and the corporation, and recommend the grant to Mr. Volk, at a yearly rental of £120, of a lease of the arch he occupies and a license for his line for a period of 21 years, the line, rolling stock, and plant to become the property of the corporation at the end of the twenty-one years.

A meeting of the Chapter of St. Ninan's Cathedral, Perth, was held in the cathedral on Friday. It was agreed to go on with the larger scheme for improving the cathedral, with certain modifications. The Bishop of St. Andrew's announced that the subscriptions already received for the improvement scheme amounted to almost £85,000, which is half the sum which the improvements are estimated to cost.

At the London Consistory Court on Friday, a faculty was granted to the vicar and churchwardens of Hendon to remove the gallery built in 1827 over the north-east chapel of that church and for the erection of a stained-glass memorial window in the chapel. A faculty was also granted to the vicar and churchwardens of Christ Church, Chelsea, to extend the chancel, to build a choir-vestry, and a clergy-vestry and organ-chamber, to take into the church a space at present occupied by a porch, to construct two new porches elsewhere, to extend the front of the church, and to alter the galleries by lowering the front seats. There is also a proposal to build a church-room on land adjoining the church, given by Earl Cadogan. The alterations will cost from £3,000 to £5,000, of which £2,500 is already in hand.

An inquiry was held by Colonel J. T. Marsh, R.E., Local Government Board inspector, at St. Helen's Town-hall, yesterday, into an application by the corporation for sanction to borrow £13,000 for the provision of refuse-destructor works at Boundary-road, in close proximity to the residential part of the town. The matter had excited considerable controversy in the town, and the scheme was opposed by many property owners and ratepayers. Evidence was given by Mr. G. J. C. Broom (borough engineer) that the site was the best they could acquire in the borough for destructor works, and he estimated the saving in carting alone to the corporation at £700 per year.

The Quay Chapel, Woodbridge, East Suffolk, was reopened, after restoration, on Wednesday week. Pitch-pine benches have taken the place of the old-fashioned pews; the pulpit, which had been occupied by, among others, Rowland Hill, has been superseded by a Gothic rostrum of varnished pitch-pine. An entirely new floor has been laid, and the ceiling ornamented and strengthened with moulded ribs. The old-fashioned small square sash windows have been replaced with leaded lights in pale tinted cathedral glass and ruby margin formed in Gothic heads. The walls are covered with sage green, relieved with terracotta stencil border. New entrance doors have been hung. The system of lighting has been entirely rearranged, and incandescent burners have been added. The galleries have also been re-benched. The organ has been repaired by Messrs. Bishop, of London. The cost of the alterations, which were carried out by Mr. W. Ingram Smith, has been about £500.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXIII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers so complete volume just ended should order at once, at many of them soon run out of print.

RECEIVED.—J. and R.—G. A.—O. B. W.—A. P.—W. N. and Co.—T. F. (Swansea).

Correspondence.

COMPETITIONS.

To the Editor of the BUILDING NEWS.

SIR,—The thanks of the profession are due to Mr. H. B. Cresswell for his splendid paper on "Competitions" reported in last week's issue of your journal, and it is to be hoped that it will help to kill the apathy which is apparently gradually strangling us, and rendering us the butt of every little obscure urban council, who seem not to have the slightest idea of an architect's professional or social position.

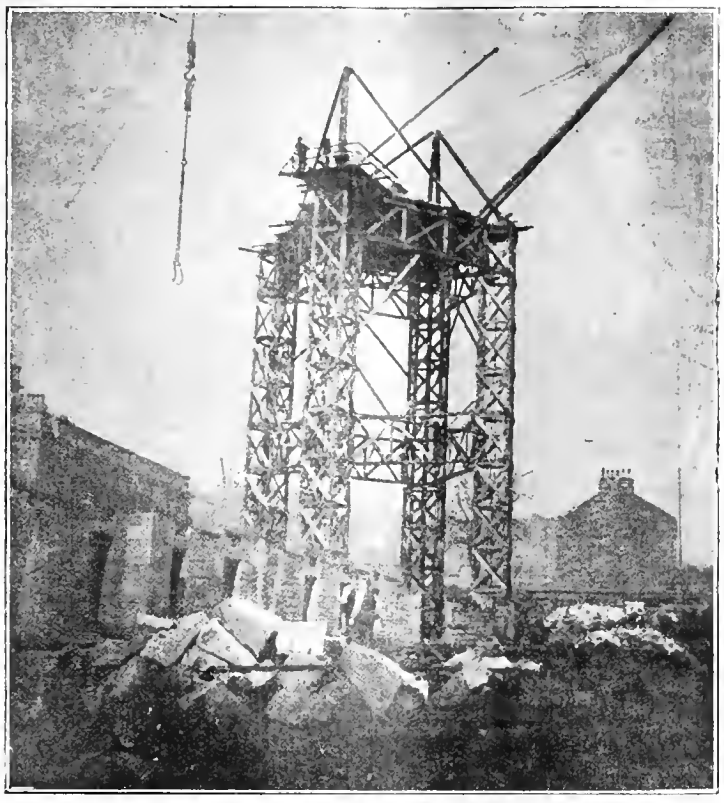
I think the cause will not be far to seek, when, as is generally known among the profession, any person may call himself an architect, and in the provinces it is no uncommon thing to see a carpenter or joiner, or small builder, an auctioneer, or even an undertaker, putting the title of "architect" at the end of their names.

Of course, the general public are liable to be misled, and imagine that such people are really what they profess to be.

This is very humiliating to the gentleman's son who has paid a heavy premium, and who fondly imagines he has entered a respectable and honourable profession. The only remedy for this state of things is registration, which would, of course, mean that a man must have an architectural training to enable him to pass the rigid examination which should be held, and I fail to see that this would affect the influence of the Institute (as some people seem to imagine), which would hold a parallel position to some of the colleges in the medical and other professions.

Apologising for trespassing on your valuable space to such an extent,—I am, &c.,

REGISTRATION.



FOUR-LEGGED CRANE SCAFFOLDING.

SIR,—I venture to send you a small photograph of the four-legged crane scaffolding at the Royal Infirmary extension in this city, taken April 16, 1898. The Ilford plate negative is at your service. I much regret that none of your correspondents have been sufficiently interested in the subject of these structures to correct my calculations which you were so good as to print on April 1, and to which I should like to add the note, which I now inclose.

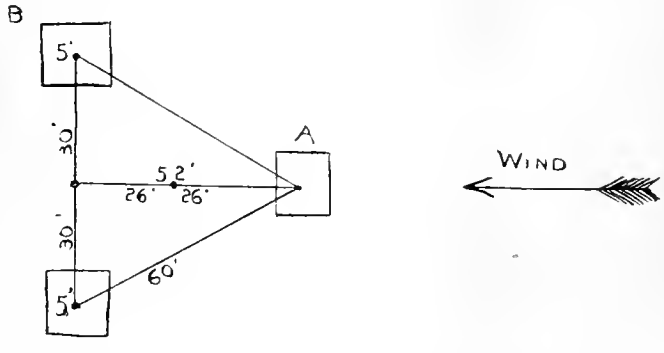
The effect of the three legs or towers being so securely connected together by the horizontal lattices at top and half-way down as to form one combined structure appears to be as follows:—In the normal state the combined weight of the three towers might be supposed to be concentrated at the centre, but there will probably be a weaker and stronger position for the legs.

The weakest seems to be with one leg in front and two behind (see diagram), all being square to the wind, while the strongest position would probably be with the wind reversed.

Let w be the weight of each tower. In the normal case there would be a moment of stability of $3w$ (26ft. by 5ft.) instead of three times w by 5ft. (as when considered unconnected), to prevent the overturn of the combined structure, or it would be about six times as strong as the separate towers. In the weakest case the moment of stability of the tower A would be increased by its greater distance from the fulcrum line B C, the moments of B and C remaining as before.

The result is naturally better in the first calculation, based on equality of situation, as the weak position of two out of the three towers overbalances the strong position of the one—i.e., $3w$ (26ft. $\times$ 5ft.) = $93w$, while w (52 $\times$ 5) + $2w$ (26ft. $\times$ 5ft.) = $67w$, and in the latter case the result would be only $4\frac{1}{2}$ times as strong as $3w \times 5$, which is the calculation unconnected.

Applying this in par. (5), where the tower $\frac{1}{8}$ hollow was only $\frac{1}{3}$ the weight required, if of 32lb. wood, we now have a combined structure $4\frac{1}{2} \cdot \frac{1}{3}$, or once and a half the strength of equilibrium in a violent hurricane of 100 miles an hour. The four legs would require to be nearly



3ft. square in each frame of 10ft. $\times$ 10ft. to provide this factor of safety of $\frac{1}{2}$ under such pressure; but proportionately as before, less wind pressure would permit relatively smaller legs.—I am, &c.,

"NISI DOMINUS FRUSTRA."

Edinburgh, April 23.

The new nave and baptistery of St. Luke's Church, Rochdale, were dedicated on Saturday afternoon by Archdeacon Wilson. The late Mr. John Robinson gave the land upon which the church stands as far back as 1875, and in 1888 the chancel was built at a cost of £2,900, a temporary nave being constructed at the same time. Now the work has been completed at a further cost of £1,150.

At St. Peter's Church, Arkley, on Friday, the Bishop of St. Alban's consecrated the new chancel just added to the church. It has been erected from designs by Mr. J. C. Traylen, A.R.I.B.A., of Broad-street, Stamford. The style is Early English, with groined oak roof and six clerestory windows. The floor is of stone, with marble in the sacrarium. The chancel is 31ft. by 17ft., and the height 27ft. to the ridge of the groining, and the vestry is 20ft. by 10ft. 9in. The chancel is lighted by four three-light peudants. Additional seating accommodation for nearly 100 people is provided by means of a south transept, and the additional length added to the church. The work has been carried out by Mr. Wade, of St. Neots, Hunts.

Intercommunication.

QUESTIONS.

[11939.]—**Workmen's Dwellings.**—Would some kind reader say the cheapest way of getting plans and specification for building workmen's dwellings, preparing for contract, &c.?—GRANTLY.

[11940.]—**The New Incandescent Light.**—Can anyone give particulars of the new incandescent light, which, I am told, requires no mantles? I am sure if it is of any use, and is advertised in this and the other professional papers, architects will thankfully use it. I have tried all the incandescent lights with mantles, and while I am well satisfied with the saving in gas two of them effect, I have reluctantly ceased to use them because of the bother and expense resulting from the fragile mantles. Shall be glad of particulars of the new light.—R. T.

[11941.]—**The Gold Coast.**—An advertisement has appeared several times in the columns of your paper during the last year, emanating from the Crown Agents of the Colonies, in which are sought the services of draughtsmen for the Gold Coast of Africa. As the salary offered is large in comparison with the pittance received by these professional gentlemen in this country, there are many, myself included, who would offer themselves for the post, if it were possible to get accurate information as to the duties and life. The London agents to the Crown, though most obliging, can furnish no further particulars than what appear in the advertisement, and I write on behalf of myself and others to know if one or more of your numerous readers who have perhaps spent some years on the Gold Coast in the capacity of draughtsmen to the Crown, would write a description of the nature of their duties, life, and associates, and as to who, what, and where their masters are, and whether the climate is as terrible as we in our ignorance imagine it? None to whom I have spoken seem to know anything about the subject, and I am sure that any light that could be thrown upon it through the columns of your paper would be most heartily appreciated by many clever young architects.—FIDEI TENAX.

[11942.]—**Adjoining Owner.**—I am architect for some new premises which will be about 2ft. higher than the adjoining property, the owner of which objects to my flashing and fixing soakers under his slates so as to make it waterproof between the two. He has written me as to how I intend to do it. Is it usual to get permission from the adjoining owner? Also, if he refuses to have this done, can he claim any compensation for dampness afterwards? I presume flashing is not considered as an easement.—DOUBTFUL.

[11943.]—**Fixing Finials.**—Will a practical correspondent inform me of the best and most secure way to fix terracotta and stone finials? Is it necessary to have a copper or metal rod up the centre, and what kind of cement should be used? Will a slate dowel be better?—ARCHITECT.

[11944.]—**Cambered Arches.**—I should like to be informed how the bricks of a flat brick gauged arch are set out and the bevels found? The ordinary treatises do not treat the subject.—A. B.

[11945.]—**Municipal Engineer's Qualification.**—What are the necessary qualifications for a borough surveyor, and how can a student prepare himself? Are there any books that will assist? I shall be glad to have a reply through your columns to these questions.—YOUNG SURVEYOR.

REPLIES.

[11937.]—**Powder Magazine.**—A store magazine should be solidly constructed with an arched roof; the sides and ends should be battened-up to the spring of the arch, and the roof either close-boarded or rendered in cement. Prevention of dampness is the chief point to guard against. Ventilation without being obliged to have the door open is important. Great care must be taken to protect the magazine from lightning if in an exposed position. All metal employed for hinges, bolts, keys, &c., should be of copper or copper alloy. It depends so much on the purpose for which the magazine is required, the site, and capacity, how it should be constructed.—C. E. H., Ex-Army Reserve Officer.

CHIPS.

The Croydon Town Council have unanimously resolved to erect new fire brigade stations at Croydon, Thornton Heath, and South Norwood, at a cost of nearly £5,000, and to provide new curricle hose-carts at four other stations.

On Saturday a special service was held in the side chapel, Brighton parish church, when a five-light stained-glass window, a memorial to the late Mr. Edward Hoadly, was dedicated. The window, the artist of which is Mr. C. E. Kemp, represents the Crucifixion, the central light depicting the Saviour and the Holy Women, the lights on either side being filled with Roman soldiers, while the two further lights show the crucified thieves.

At the last meeting of the Southampton Corporation, the Housing of the Working Classes Committee brought up a scheme for the erection of artisans' dwellings on part of the cleared slum area in Simnel-street. The cost is estimated at £5,000, and accommodation will be provided for 134 people. The scheme was adopted.

There has been placed in St. Magnus Cathedral, Kirkwall, a stained-glass window to the memory of the late Provost Thomas Peace. The subject is Christ's Story of the Good Samaritan. The memorial is erected in one of the windows of the south aisle, and has been executed by Messrs. Ballantyne and Gardner, Edinburgh.

LEGAL INTELLIGENCE.

IN RE W. AND T. CROSS, OF WARRINGTON.—At the Warrington County-court, on Friday, before his Honour Judge Ffoulkes, Messrs. Walter and Thomas Cross, builders, Warrington, applied for their discharge in bankruptcy. The petition was filed on October 7, 1896. The liabilities, according to proof, were £2,258 2s. 8d., and the assets realised £107 17s. 9d. A first and final dividend of 1½d. in the pound was all that had been paid. He reported nine serious trade offences against the bankrupts, including that they had kept no books, continued to trade after knowing they were insolvent, failed to account satisfactorily for the deficiency in the assets, guilty of rash and hazardous speculation, within three months after being unable to pay their debts had given preference to two other creditors, and each of them had made previous composition. Mr. Arthur Browne, solicitor, on behalf of the bankrupts, said these offences arose through ignorance of their position and want of education. They were hard-working bricklayers, who had begun building on their own account, first in a small way and latterly on a much larger scale, when they employed as many as 150 workmen. The judge, in reviewing the report, said it was a bad case. Ignorance and want of education was absolutely no excuse whatever. He refused the application altogether, and declined to give leave to Mr. Browne to apply further.

IN RE W. R. QUESTED.—A first meeting of the creditors of W. R. Quested was held before Mr. A. H. Wildy, Official Receiver, on Friday. The debtor, a builder, described as of Shrewsbury-road, Stonebridge-park, states that he has been engaged in building operations since October, 1894, at Penge, Harlesden, Willesden, and Harrow. The mortgagees have foreclosed, and the debtor attributes his failure to having too many irons in the fire, and to their being too far apart. The accounts show gross liabilities amounting to about £25,000, of which £5,202 are expected to rank, and assets £470. Mr. A. C. Bourner, accountant, was appointed trustee to wind up the estate in bankruptcy.

SEWERAGE PROVISION FOR MANUFACTURING REFUSE.—PASMORE AND OTHERS V. OSWALDTHISTLE URBAN DISTRICT COUNCIL.—In the House of Lords on April 28th, the Lord Chancellor, Lord Macnaghten, Lord Morris, and Lord James of Hereford gave judgment in an appeal from a decision of the Court of Appeal. The action was for a *mandamus* commanding the defendants (respondents in the present appeal) to cause to be made sewers under the Public Health Act, 1875, and to give facilities for enabling the plaintiffs to carry the liquid proceeding from his factories or manufacturing processes into the sewers under their control. The action was begun by Philip Cadell Peebles (since deceased), who owned and carried on the business of paper-making at the Whiteash Paper Mill, to compel the defendants to provide sewers for the reception of the liquids from the paper mill. The claim was based on the Public Health Act, 1875, sections 15 and 21 of which impose on a local authority the duty of providing a proper sewerage system. The respondents, however, contended that such obligation was not one towards the appellants or any individual occupier, but for the benefit and purposes of the whole district. They also relied upon section 299 of the Act, which prescribes, as the remedy in such a case, complaint to the Local Government Board. The case was heard by Mr. Justice Charles on November 11, 1896, and by arrangement the question of law was argued before any evidence was gone into. The learned Judge granted the *mandamus*, but on March 18, 1897, the Court of Appeal [the Master of the Rolls (Lord Esher), Lord Justice Lopes, and Lord Justice Chitty] reversed that decision, and dismissed the action with costs. The Lord Chancellor, in moving that the appeal be dismissed, said there was nothing in the Public Health Act which would justify the issue of a *mandamus*. The whole purview of the Act made impossible the application of such a remedy. Performance of a statutory obligation could not be enforced in any other manner than that prescribed by the statute. He entirely concurred in the judgment of the Court of Appeal. The insufficiency of drainage in this case only extended to a particular manufactory. It was, therefore, within the exact words of the Rivers Pollution Prevention Act, 1876, section 7 of which provided for the grant of facilities for enabling manufacturers to get rid of refuse and enacted that no sanitary authority should be required to give such facilities where the sewers of such authority were only sufficient for the requirements of their district. The duty lay primarily on the manufacturer to get rid of his own refuse. Lord Macnaghten read a judgment to the same effect, and the other learned Lords concurred.

MANCHESTER CORPORATION V. PERKINS, GRAHAM, AND CO.: ARBITRATOR'S AWARD.—Sir Benjamin Baker, the arbitrator to whom the action of the Manchester Corporation against Messrs. Perkins, Graham, and Company, in respect to the construction of certain sewers in that city was referred, has made his award. The arbitrator finds that the defendant company committed breaches of the contract set out in the statement of claim, and that such breaches consisted in part in the fraudulent substitution by workmen employed by the defendant company of works not in accordance with the terms of the said contract for the works which the defendant company were bound to execute, and which the said workmen were employed to execute. "It was the duty of the defendant company and the defendant James Perkins to have prevented the said fraud, and to have discovered and remedied the improper substitution of works, and that by the negligence of the defendant James Perkins, or those for whom he and the defendant company were responsible, the defendant failed to prevent or discover the same," but his failure to do this was due to negligence, and that owing to such negligence the defendant "was not aware of the said fraudulent acts, and that he was not party or privy to any fraud in the matter, and that neither he nor any other director or agent of the company having any duty or authority to make any representations to the plaintiffs on the subject made any fraudulent representations." In respect of the contract in the statement of claim, the arbitrator finds that the plaintiffs were entitled to retain the sum of £464 16s. 2d., and to receive out of court the sum of £1,900 paid into court by the defendants, and to receive from the defendant company a further sum of £1,819. In respect of contract No. 11 in the counter-claim the plaintiffs were entitled to retain the sum of £350 in satisfaction of the breaches of that contract. The arbitrator further finds that the defendants Godfrey Heathcote and Richard Jessop Dearden are liable upon their bond as sureties for the defendant company to pay to the plaintiffs the sum or sums not exceeding £1,000 in discharge or part discharge of such part of any of the said sum of £1,819 as the defendant company shall fail to pay in pursuance of the award and judgment entered thereon. Accordingly he directs that the sum of £1,900 paid into court in the action, and any interest which may have accrued thereon, be paid to the plaintiffs, and that judgment be entered for the plaintiffs against the defendant company for £1,819, and against the defendants Godfrey Heathcote and Richard Jessop Dearden jointly and severally for £1,000, but that judgment be not enforced against the last-named defendants except for such part of the sum of £1,840 as the defendant company shall have failed to pay. He orders that each of the parties shall bear his and their own costs of the action and counter-claim and all proceedings thereon, including the trial, and that the costs of the award, which are fixed at £296 15s. 6d., shall be paid, as to one moiety by the plaintiffs, and as to the other moiety by the defendant company. In conclusion the arbitrator declares that, save as aforesaid, no party to the action or counter-action is entitled to any relief against the others or other in respect of the matters referred to him.

Mr. William Saise, late surveyor to the recently-dissolved urban district council of Stapleton, near Bristol, has been elected surveyor to the urban district council of Kingswood.

The Light Railway Commissioners have informed the promoters of the Sheppey Light Railway that they will recommend the Board of Trade to issue an order empowering the construction of the proposed line from Queenborough to Leysdown. The route originally laid down by the promoters has been diverted to meet the wishes of the various public bodies in the Isle of Sheppey, who favoured a route which would bring the line more into touch with Sheerness and Minster. The cost of the line is estimated at £52,000.

After long delay, the centre span, which had been lacking to complete the London County Council's temporary iron bridge over the Thames at Vauxhall, has at length been placed in position and fixed. Its span is 165ft., and its weight about 130 tons. Although the new structure is nominally temporary, it will in reality have to do duty for probably ten or a dozen years, whilst the condemned Vauxhall and Lambeth bridges are successively undergoing demolition and reconstruction. It has been executed by the Thames Ironworks and Shipbuilding Company.

Colonel W. L. Coke held an inquiry at the Town-hall, Morley, on Friday, in respect of an application by the corporation to the Local Government Board for sanction to borrow £40,000 for purposes of street improvement, £2,600 for the erection of artisans' dwellings, and £400 for works of sewerage in Victoria-road. Plans of the various works were explained by Mr. M. H. Sykes, borough surveyor of Stockton-on-Tees, formerly of Morley, under whose supervision most of the works had been carried out.

Lieutenant-Colonel A. E. Smith, R.E., held an inquiry at Bootle, on Friday, on behalf of the Local Government Board respecting an application by the Bootle Corporation for permission to borrow £2,734 for street improvements.

Our Office Table.

The annual *soirée* of the Architectural Association last Friday evening reverted to the older form of a smoking concert at the Café Monico, and the return to a simpler and more convivial form of entertainment proved exceedingly popular. Among the crowded audience we noticed a large proportion of the older members of the A.A., who seized the opportunity given by a less formal gathering for a social chat with early friends. The president, Mr. Hampden W. Pratt, occupied the chair. With the exception of Mr. F. D. Clapham, nearly all those who appeared on the boards were professional entertainers, and the various selections were heartily received, and in many cases redemanded. These included a pianoforte selection by Victor Holliday, sentimental songs by Messrs. W. H. Berry, F. Pearce, M. Denis O'Sullivan, and A. S. Winckworth; recitations by Messrs. E. L. Ebsworth, Wilfred Stracey, and F. D. Clapham; ventriloquism by Mr. G. W. Kenway, and comic songs by Messrs. W. H. Berry, Bob Rae, Wilson James, Garney Russell, and Charles Cochrane.

It is a matter for regret that the ever-flowing tide of house-building in London steadily encroaches on the outlying suburbs, and engulfs the larger mansions with their spacious grounds; but the change in the old order giving place to new is inevitable. The latest instance of the kind is the large group of freehold properties in Streatham, occupying the area between the High-road, Streatham, and the picturesque common of Tooting Bec, which is to be sold by auction by Messrs. Farebrother, Ellis, Egerton, Breach, and Co., at the Mart, Token-house-yard, on Thursday in next week, the 12th inst., in one lot. There are at present situated on the properties seven family residences, with pleasure-grounds and stabling, the remainder consisting of slightly undulating park-like meadow land, and some business premises in the Streatham High-road. The estate possesses four existing frontages, nearly 3,000ft. in length, to the High-road, Tooting Bec-road, Garrad's-road, and Mount Ephraim-lane, and contains a compact area of 47 acres, "ripe for immediate development as a high-class building estate," as the auctioneers' phrase runs.

The excavations in the island of Milo, which were recently commenced by the English School of Archæology, under the Director, Mr. Hogarth, have been continued with much success. The first ruins brought to light were those of a very ancient Acropolis, and there were also discovered the structure of three towns, each built over the other, and two of them, as indicated by the style of the fragments and vases, belonging to the Mycenian epoch. The third lies next to the rock. The Acropolis belongs to the island epoch, before the introduction and development of Mycenian art. The excavations are regarded as very important in relation to the origin and extension of Mycenian art in modern Greece. Professor Gardner, ex-Director of the School, accompanied by about twenty students from University College, London, has lately arrived in Athens, and will go to Milo to visit the excavations.

The special sub-committee of the Birkenhead Gas, Water, and Electrical Committee, appointed last January to report upon the manufacture and supply of carburetted water gas by the corporation, now report that investigations have been made by the borough gas engineer, Mr. T. O. Paterson, M.Inst.C.E., with the result that of the 241 persons who petitioned the council complaining of badly-lighted houses and streets, and noxious smells, and alleging serious injury to health from the gas supply, 177 replied to a circular requesting a definite complaint. In 129 cases a special inspection was made, and in 38 cases the defect was remedied, 51 were satisfied without anything being done, and 30 persons remain dissatisfied. Statistics are given showing that the average illuminating power of the gas during the year was higher than the preceding four years, when water was not mixed with the coal gas. The report also states that the number of complaints fell from 3,914 in 1896 to 1539 last year, and police complaints of street lamps were likewise reduced in a marked degree, while the utter absence now of naphthaline deposits in the services has removed a fruitful cause of complaint. As to the bad smells alleged, the committee state that every precaution is taken to prevent the emission of bad smells at the works, and quote from a special report by Professor Sir Henry Roscoe, of London—"The products of combustion of carburetted water gas are not more injurious to health than are those of coal gas"; and a somewhat similar opinion given by Professor Lewes, F.I.C., in March last year. The gas engineer states that if the mixture of coal gas and carburetted water gas now supplied to the town is distributed and consumed with the same care and attention to pipes and fittings as has been given when coal gas only was supplied, there can be no reasonable or valid objection to the supply and use of a mixture of carburetted water gas and coal gas.

A scheme for supplying electric current within the whole municipal area will be submitted to Glasgow Corporation on an early date. Mr. Chamen, the newly-appointed engineer, has submitted a report on the matter to the electricity works sub-committee of the corporation, and that committee has approved generally of the suggestions made. The report states that the Waterloo-street station, with its capacity for 3,300H.P., being taxed to its utmost limit, a new site has been purchased at Port Dundas, where work has already been begun, and arrangements have been made for the purchase of another site for a generating station on the south side of the river, near Eglinton-street station. At Port Dundas there will be no difficulty in installing some 30,000H.P., and at the southern station another 15,000H.P. Waterloo-street station is at present distributing current at a pressure of 100 and 200 volts; but the Board of Trade regulations now permit current to be supplied at 250 and 500 volts, which enables the current to be carried much farther, and saves very largely in the amount of copper required in the distributing mains and feeders, the economy being about 50 per cent. The new plant already ordered for Port Dundas is designed to supply current at the increased pressure, and the plant for the southern station could be similarly designed. The capital expenditure detailed in the report is £551,000, made up as follows:—Capital expenditure at present, £150,000; capital expenditure proposed in report, £396,000; cost of removal of Waterloo-street plant, £5,000.

Mr. E. M. Wimperis, R.I., is to be congratulated on the excellent mezzotint which Messrs. Frost and Reed, of Bristol, have just now published of this painter's breezy picture, entitled "A Wet Road." The village church, surrounded by farm homestead buildings, occupies the middle distance beyond a meadow, in front of which, and skirting the lane which is flooded by the spring rains, runs a timber foot-bridge. A waggon and horses form the central group in the foreground, and are seen emerging from an avenue of trees in full foliage, massively and richly handled, reminding one of Constable. The sunlit, rolling clouds are well in scale with the landscape, which is rich in tone and delicate in the management of its high-lights 'twixt the leaves, the effect of the whole being broadly treated, just catching the partial glow of the sunshine after the early summer's shower. The engraving, which measures about 3ft. by 2ft., including the margin, has been charmingly engraved by Mr. A. J. Skrimshire.

The first anniversary of the Charity Bazaar fire in Paris, by which about 124 persons lost their lives, was celebrated on Wednesday by a meeting of the executive of the British Fire Prevention Committee, formed for the purpose of dealing with all matters relating to fire protection, but having special regard to the prevention, as distinct from the extinguishing, of fires. According to the provisional rules, the main objects sought by the committee are as follows:—To direct attention to the urgent need for increased protection of life and property from fire by the adoption of preventive measures. To use its influence in every direction towards minimising the possibilities and dangers of fire. To bring together those scientifically interested in the subject of fire prevention. To arrange periodical meetings for the discussion of practical questions bearing on the same. To establish a reading-room, a library, and collections for purposes of research, and for supplying recent and authentic information on the subject of fire prevention. To publish from time to time papers especially prepared for the committee, together with records, extracts, and translations. To undertake such independent investigations and tests of materials, methods, and appliances as may be considered advisable. To facilitate the formation of centres for any of the special interests involved, to offer such technical information as these interests may require, and to issue notices, warnings, &c., for their especial benefit. To retain skilled advisers for the inspection of buildings or appliances where independent advice is desired. The list of persons who have already joined the committee not only contains a large number of names, but shows that the movement has had encouraging support from the technical professions. At their meeting on Wednesday the executive committee, of which Mr. Edwin O. Sachs is chairman, considered the definite arrangement of a series of independent tests with fire-resisting materials.

Professor Hull, late director of the Geological Survey of Ireland, read a paper before the Victoria Institute, on Monday night, descriptive of his researches as regards the river valleys and escarpments off the British Isles. Referring to the fact that the British Isles were planted on a platform raised 100 fathoms, called the 100-fathom platform, he described the platform as sloping down to the ocean-bed everywhere except off the west coast of Ireland, where it became a magnificent escarpment of 7,800ft., ending in a sloping plain going down 12,000ft. more. He held that this great escarpment was once above the sea-level previous to later stupendous physical changes. He referred to the Irish and English Channels as being submerged river-valleys, and described the North Sea, Irish Channels, and north-west coasts as having been covered in parts with land-ice, the muddy waters of the later glacial seas giving place to those of the present day.

Another cave was discovered at Oban on Saturday. On removing some earth from a rock-face at the west end of High-street, a large quantity of shells was come upon. These were recognised as of the same type as those found in the M'Arthur Cave. Messrs. Munro and M'Isaac, Oban, and Dr. Allan Macnaughton, of Taynullt, took measures with the view of having the cave refuse thoroughly examined. Two bone harpoons were got early in the day. Their length is 3in., and breadth ¾in. The barbs are only on one side, and in this they differed from the harpoons of the M'Arthur Cave, which had barbs on both sides. That the cave had been occupied for a long time was evident from the cart-loads of shells which have been taken away from the opening, and the great quantity that the workmen are still clearing away. A part of a large antler of red deer was also found. That the cave dwellers had fires was shown clearly enough, burnt wood and ashes being abundant. The vaulted roof of the cave is blackened as if by smoke. It is expected that Dr. Joseph Anderson will visit the cave and report upon it, as he did in the case of the M'Arthur Cave, which yielded such interesting relics of a far past time.

Messrs. B. Ward, and Co., of 15, Great George-street, Westminster, London, S.W., have recently brought out a patent artificial stone step with a leaded tread, and have used them at the extension of the Architectural Museum, Donald Currie and Co.'s new offices, and other buildings. The lead is cast in the form of a grid, so that each dot is, as it were, tied together, and is ¾in. deep. The advantages are perfect security against slipping, great durability, neat appearance, and considerable economy.

Mr. George Keeble, of Peterborough, is opening the ground for a brickyard alongside the new railway line at Bourne, Lincolnshire. The yard is intended for the production of red bricks.

It is proposed to carry out the widening of Camberwell New-road at its junction with Camberwell Green at an estimated net cost of £31,500. The Camberwell Vestry have voted £5,000 towards the cost, and the London County Council have the matter under consideration.

The Streets Committee of the Edinburgh Town Council have resolved to recommend approval of plans of a new bridge proposed to be erected over the Water of Leith at Bonnington, at a probable cost of £5,500, and to ask a remit to meet with Leith Corporation on the subject.

A Select Committee of the House of Commons began, on Friday, the consideration of the Southwark and Vauxhall Water Bill, the objects of which are to enable the company to acquire lands, construct additional works, and take additional water from the Thames. The company propose to construct new storage for 1,076,000,000 gallons of water.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (To-morrow).—Edinburgh Architectural Association. Visit to Craigiehall. By train from Caledonian Station, 2.7 p.m.

MONDAY.—Society of Arts. "Electric Traction," Cantor Lecture No. 2, by Professor C. E. Carus Wilson, of McGill University, Montreal. 8 p.m.

Bristol Society of Architects. "Plumbing," by George Tucker. 8 p.m.

Carpenters' Hall, London-wall, E.C. "Strength and Strains in Wood," by Professor T. Hudson Beare, M.Inst.C.E. 7.30 p.m.

TUESDAY.—Society of Arts. "The Art of William Morris," by F. S. Ellis. 8 p.m.

WEDNESDAY.—Society of Arts. "Water-Gas and its Applications," by Professor Vivian B. Lewes. 8 p.m.

FRIDAY.—Auctioneers' Institute. Annual Dinner at the Hotel Cecil.

CHIPS.

The memorial altar to the late Bishop Edward Bickersteth, D.D., Bishop of Japan 1886-97, leaves England this week, and will find a resting-place in St. Andrew's Church, Shiba, Tokyo, Japan, where the late Bishop so long laboured. It is composed entirely of British oak, and the elaborate sculptured panels and carvings are in high relief. The work has been executed by Messrs. Harry Hems and Sons, of Exeter.

A Jubilee church room at Soperton, Devon, designed by Messrs. Tait and Harvey, of Exeter, was opened on Wednesday in last week.

The first of Mr. J. Romilly Allen's Yates Lectures in Archæology, the subject of which is "Celtic Art and its Developments," was delivered at University College, Gower-street, W., on Wednesday.

A font and a memorial window were dedicated in the Parish Church of St. Etheldreda, Fulham, on Saturday, by the Rev. Professor Collins, of King's College.

The Bishop of Coventry, on Saturday afternoon, preached at the dedication of the new Church of St. Edward, which has been provided by the purchase and adaptation of an old Presbyterian Chapel in New John Street West, near Summer-lane, Birmingham. About £1,200 has been expended in the purchase and alterations.

The foundation-stone of a Church Sunday-school was laid at Perranarworthal, West Cornwall, on Thursday in last week. Mr. W. Smith, of Truro, is the architect of the new building, and the contractors are Messrs. J. Row and J. Barnicott.

The Streets Committee of the Court of Common Council for the City have recommended in an amended report on the area affected by the Cripplegate fire, that Jewin-street be widened to between 40ft. and 50ft., in that way placing it on an equality with Fore-street. At present, from No. 26 to No. 30 the width is 30ft., while the remaining portion of the street is 3ft. wider. The suggestions for improving Well-street and Hamsell-street and for extending the improvement into Smithfield and London Wall have been negatived.

The new railway route between Wrexham and Mold was opened on Monday. The line runs *via* Brymbo, Ffrith, Llanfynydd, and Coed Talon. It is the joint property of the Great Western and North-Western, and from Coed Talon to Mold the last-named company is the owner.

The members of the Harold Club, at Low Moor, assembled in force on Tuesday evening at the club premises, which have recently undergone some noteworthy extensions. The principal alterations have affected the assembly-room on the ground floor, which has been considerably enlarged, and is now quite twice its original size, whilst immediately above it the billiard-room has been similarly extended, all at a cost of about £859. Mr. Healey, of Bradford, was the architect.

At the Tuesday meeting of the Birmingham City Council sanction was given to a scheme for purchasing for £2,250, land at the corner of Moseley-road and Lime-grove on which to build a branch school of art, which is to cost not more than £7,750 in addition. At the same meeting the final stage was reached in the competition for Holly Moor Asylum, the report of the assessor, Mr. G. T. Hine, F.R.I.B.A., being passed after some discussion, recommending the adoption of the plan No. 4, marked "Forward," by Messrs. Martin and Chamberlain, of that city.

A Local Government Board inquiry was held at Dublin on the 28th ult. by Mr. Cotton, chief engineering inspector, into applications made by the corporation for the following loans: £1,300 for converting the site of the Green-street Prison into an open space; £1,000 for repairing Bachelor's-walk; £3,000 for concreting footpaths; £1,900 for new paving; £4,800 for repaving; a further sum of £2,700 for concreting footways; and £364 for asphalting.

Trade News.

WAGES MOVEMENTS.

BANGOR.—The carpenters employed in the Bangor building trade on Saturday intimated to the masters that unless there was an immediate increase in wages their tools would be removed. The masters, in resisting the demand, submit that longer notice should have been given, so as to enable them to readjust their estimates for contracts. At a meeting on Saturday night the establishment of a branch of the plasterers' union was decided upon. The master painters have conceded the demand for a uniform rate of wages.

BLACKBURN.—On Saturday morning the stonemasons of Blackburn and district all came out on strike for an advance of one halfpenny per hour, and against the proposal of the employers to abolish a rule prohibiting the importation of stone worked in other towns. Nearly all the towns in East Lancashire, as well as Manchester, are involved in this dispute, which may lead to a considerable stoppage of building operations.

BRIGHOUSE.—The masons' labourers came out on strike on Monday for a halfpenny per hour advance in wages, their present remuneration being 5½d. per hour. Some of the masters have conceded the men's demands. The building trade is very brisk at present in the borough, and it is expected that the dispute will be brought to a speedy termination.

GREENOCK.—The federation lock-out notice not having been withdrawn on Saturday by the Greenock Cabinet-making Company, Limited, the employés of the firm came out on strike. The men lifted their tools on Saturday afternoon. About 50 men are affected.

LEIGH, LANCS.—The joiners and carpenters of Leigh, Tyldesley, Atherton, and surrounding districts have requested an increase in wages from 8½d. to 9d. per hour, and a reduction in working hours from 51 to 49½ per week. The men, who number 166, were, failing these consessions, to have struck work on Saturday; but the employers sent a communication requesting the men's delegates to again meet them in a few days. They have agreed to do so, and not hand in their notices until after the conference.

PORTSMOUTH.—The Portsmouth plasterers of this town have struck work for one penny per hour advance. It is believed that an amicable settlement will soon be arrived at.

ROCHESTER.—The threatened strike in the building trades in the district of Rochester, Chatham, and Gillingham which was to have commenced on Monday, has been averted, the employers having agreed to increase the pay of the bricklayers a penny per hour, that of the carpenters a halfpenny, and that of the labourers a halfpenny per hour. The demand of the plasterers for an increase has not yet been complied with, as their notices have not expired. It is now expected that the painters will apply for an increase, so that the whole of the employés in the building industry will have improved their position considerably. Work is exceedingly brisk here, apart from that provided by the Royal Naval Barracks, the Chatham town-hall, Messrs. Barnard's theatre, the New Brompton co-operative bakeries, and other large structures in course of erection. The cost of labour has now been increased 12½ per cent., and the price of building materials has advanced all round.

SOUTH SHIELDS.—A meeting of employers and employés was held at South Shields on Monday, when it was agreed to leave the question of cementing and tiling — the bone of contention between the bricklayers and plasterers—at the discretion of the employers. Work was resumed on Tuesday at the following rates of wages:—Bricklayers, 10d. per hour; plasterers, 9½d. per hour; labourers, 6½d. per hour.

STOCKPORT.—The labour market in this town is in a very restless condition. The house painters are agitating to have their wages raised to the Manchester rate. A dispute amongst the joiners was amicably settled on Saturday at a conference between masters and men, but all the bricklayers are still on strike. The question in dispute is a proposal by the masters to curtail what is known as walking time. The employers' proposals would necessitate the men working outside the town rising much earlier to reach work.

WINSFORD.—The bricklayers of this district came out on strike on Monday, as the demands made by them in the notice just expired were not granted. They claim that they are the worst paid bricklayers in Cheshire, their wages being 6½d. per hour, against 11d. in Manchester and Liverpool, and 9½d. in Northwich. An additional 1½d. per hour has been demanded, and builders have agreed to make the concession providing the Salt Union fall in; otherwise 7½d. is offered. The men have refused this, and the Salt Union are unwilling to grant the increase.

WESTON-SUPER-MARE.—A large number of carpenters ceased work on Saturday on account of a difference with their masters. Their demand for an increase of wages to the extent of ½d. per hour was acceded to, but as the masters insisted upon altering certain of the rules of the society the men decided to go out on strike. At a meeting of the men on strike, held on Tuesday evening, a resolution was passed to the effect that no alterations could be, or should be, passed in the working rules without the six months' notice required by Rule 9, to which the masters had agreed, being duly given.

The Lord Chancellor opened the new Victoria wing of the Morley Convalescent Home for Working Men at St. Margaret's Dover, on Wednesday. The institute has been doubled in size, the accommodation having been increased from 60 to 120 beds, and a dining-hall and administrative offices have also been provided. Mr. G. Stevenson was the honorary architect.

On Thursday in last week the Bishop of Southwell dedicated the completion of the north aisle of the church of St. Alban, Sneinton. The church, designed by Messrs. Bodley and Garner, was consecrated ten years ago, but, owing to lack of funds, the north and south chancel aisles were not then built. Now the north aisle is finished.

Mr. Edward D. Conolly, a prominent contractor and builder, of New York, died at his home in that city a fortnight ago. Mr. Conolly's most important work was the building of St. Patrick's Cathedral, with the rectory and the archbishop's house adjoining; but he erected also many houses and other structures in and about New York. He was one of the founders of the Mason Builders' Association of New York, and a member of the Catholic Club.

The Unopposed Bill Committee of the House of Commons passed, on Wednesday, the Bill authorising the incorporation of a new company for the purpose of constructing a tramway from Llandudno to the summit of the Great Orme's Head. The capital of the company will be £25,000, with power to raise £6,250 upon the issue of debentures. The tramway, which will be 7 furlongs 6·80 chains in length, will be constructed as a single line. The time granted for the construction of the line is three years from the passing of the Act. This Bill has already passed the House of Lords.

The Alloa Public Baths and Gymnasium, which have been erected by Mr. John Thomson Paton for the benefit of the community, were formally opened on Friday by Mr. J. B. Balfour, M.P., Q.C.

A three-light stained-glass window has been placed in All Saints' parish church, Holbeach, in memory of the late William Rippon, who, although he lost his sight at the age of 28, continued in business as a working watchmaker. The subject is Our Lord healing Blind Bartimæus, and the work has been executed by Mr. E. M. M. Smith, of Spalding.

The committee for the restoration of the fine parish church of St. Germains, Cornwall, was formally disbanded last week, the work of restoration, on which it has been engaged for the past ten years, having been completed, at a total cost, including special gifts, of over £8,000. It was agreed to expend the balance in hand of £30 in another stained-glass window.

Six large stained-glass windows have been placed in All Saints' Church, Eastbourne, as a memorial to Lady Victoria Long-Wellesley, who built the church in 1882.

A stained-glass window has been placed in the east end of East Down Church, Devon, in memory of the Rev. T. F. Arthur, who was for 28 years rector of the parish. The subject of the window is Christ, with St. John (the Patron Saint) on the left and the Virgin Mary on the right. Mr. C. E. Kemp, of London, was the artist.

Mr. Sidney Webster, builder and contractor, of Bootle, died at his residence in Birkdale near Southport on Friday, aged 51.

A new laundry and other additions are about to be made to the workhouse at York from plans by Mr. Penty of that city. Tenders amounting to £4,437 were accepted for the works by the York board of guardians last week.

The Leicester Corporation have sanctioned the purchase of certain properties at a cost of over £6,000 for their street-widening schemes, and have decided to ask the Local Government Board for compulsory powers of purchase to acquire various other properties. The scheme will cost between £100,000 and £150,000.

The Government of Victoria intend to carry out several public works, including a scheme for the irrigation of the country, for the erection of cold storage depots, and for the opening up of the inaccessible parts of the Colony, at the aggregate cost of over two million pounds, which will be raised locally at the rate of £750,000 annually.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2262.
FRIDAY, MAY 13, 1898.

IRRESPONSIBLE BUILDING.

AN immense number of buildings of a private and semi-public character are erected without any responsible control. The contractor in many instances becomes the mere figure-head who undertakes to carry out the work by organising labour and obtaining the materials, but he does not bind himself to do much more; if he does, he manages to throw any blame that attaches to the work on the shoulders of others, and often on the architect. He alleges an omission of something in the specification or drawings, or tries to wriggle out of his duty under the pretext of an alteration or extra. Nor can the architect be regarded as culpable. His responsibility only extends to matters of design and general supervision; but he does not guarantee that all the materials used are sound or that the workmanship is quite up to the standard required. He has to find the lowest tender at which his design can be carried out, and how can we expect him at the same time to guarantee the work? No doubt it would be honest on his part to refuse to accept a very low tender; but in ordinary business in these days he is obliged to stifle his conscience, and submit to the inevitable. Very often he is called upon to carry out work that cannot be executed at the price undertaken, and he is compelled to wink at a good deal of what is done if the building is to be finished at all. This is one of the greatest hardships of the architect's position under a contract system which binds the contractor to drawings and specifications or terms of contract that he cannot fulfil. And it places the architect in the unfortunate dilemma of either having to watch very closely the work of the contractor, or else having to pass unnoticed a number of things that are contrary to the specification standard. To object to every load of bricks or timber, or to find fault with the brickwork or the joinery, necessitates often to wink at a great many little things that are almost as important. The degree of responsibility is very largely regulated by the conditions imposed—the contract amount, time of completion, and other matters. The architect's responsibility is also a question of whether he is to have full power to provide what is necessary, or to cut and trim to meet a client's pocket or a whim. In some cases the buildings are erected for a speculative purpose to pay or sell, and the architect's control or supervision becomes a mere nominal matter. In short, an architect is engaged simply to prepare a design or a set of plans, and to see to the erection of the buildings. The employer hardly expects him to do more than to supervise the buildings in a general way. He does not look for substantial construction, for he is only a leaseholder, and does not see putting more money on another man's land than he is obliged to do. If the building endures his lifetime, he is satisfied; he only wants it designed in a tasteful or fashionable manner. Hundreds of new commercial buildings, hotels, blocks of dwellings, and offices are put up in this way. They are built to let or sell, or to do business in. Can we expect any substantial construction? Irresponsibility attaches to all buildings of this sort. If the walls, roof, or floors of a building so built give way, or kill or injure anybody, the question of responsibility is in everyone's mouth. But how can the syslem of building we have described be expected to produce any better results? When, as in the recent serious collapse at Westminster, the result of which we report, the contractor states he secured the land to build upon, and that the erection was "purely a venture"; that he sub-contracted for the brickwork, concrete floors, girders, and roof, by which he lost all control and only had to do with the labourers, how can responsible building be secured? To employ an architect to prepare plans and then to leave others to carry out the contract work—this is the way many of our buildings are erected. The practice of sub-contracting has, no doubt, much to do with building failures. Foundations, brickwork, fireproof floors, or iron girders are sub-let; but very often the general contractor, who is held responsible for the work, cannot insist that the parties who undertake these branches should be placed under the same agreement or contract as he himself holds—in short, that each sub-contractor should hold under the same terms and be responsible for carrying out his particular work, as if he were working direct under the contract.

In most good contracts the provision is made that the contractor shall not, without the consent of the architect in writing, sub-let any portion of the work; and a further clause ought to be inserted that no sub-contractor, whether nominated by the architect or contractor, shall be engaged who will not enter into a contract with the latter to the effect that he will carry out the work according to the contract, and indemnifying the contractor against any claims that may be made against him in consequence of any act, omission, or fault of the sub-contractor or those in his employ. But how often is this saving clause left out, and the work is sub-let to men who have no interest in the building whatever, and who only agree to carry out such-and-such work at a given sum, but without making themselves responsible for anything beyond. The irregularities of the sub-contract work at Abbey Mansions, Westminster, illustrate this independence. It is hard to say, perhaps, what kind of contract is considered "personal" in law, especially if there is no condition of the sort we have just defined, though from certain facts, as the selection of builder, this condition of a personal contract may be implied. Employers and architects are not quite so careful as they ought to be in cases of this kind. There is a legal maxim to the effect that "no one not a party to a contract can sue on it," and according to this rule, if a builder sub-lets to a bricklayer or plasterer any part of the work, the said workman or sub-contractor cannot sue the employer. The same rule may be said to apply to employers. They cannot sue for any defect on the sub-contractor's part unless it forms a condition of contract. The right to sub-let also is larger than the right to assign, and it has been held that the contractor can claim for work he sub-lets if done properly; but he is also liable for the defects of the sub-contractor. An important point has been sometimes raised as to whether, if a sub-contractor knew the terms of the original contract, they would be binding; but the fact of knowing does not prove that the sub-contractor agreed. But these are questions of legal import into which it is not necessary to go here.

PICTURES AT THE ROYAL ACADEMY.

[THIRD NOTICE.]

THE Fourth Gallery, with the few exceptional pictures we have noticed, need no longer detain us. A good deal of the wall-space is taken up by work of a commonplace and indifferent character, in addition to portraits. H. Weigall's large and crowded picture of the interior of a Court of Quarter Sessions at Sandwich is interesting only to a few. The painter has done his best to delineate with minuteness the incidents and features of the particular trial represented before His Honour Judge Lumley Smith. But no painter can make such a subject pictorial. John M. Swan's poetic theme, "Fortune and the Boy," is a kind of enchanted garden in which a boy is lying down near a fountain. The painter depicts the fair phantasy of the boy's imagination or dream. From the iridescent colour of the water the fair figure of Fortune rises. The work is subtle and admirable in colour. "Electricians"—boy amateurs round a bench examining a battery or making one—is clever and vigorously painted, admirable in colour. George D. Leslie's view of "Arlington Row, Gloucestershire" (369), is interesting for the greenish hue which pervades the landscape; a row of stone houses for artisans, covered with stone shingles, with a green hilly background. The effect is that of looking at a landscape through green glasses. It is rather a conventional treatment devoid of atmosphere.

There is not much in Gallery V. Colin Hunter's "Bringing Home the Bracken" is a very fine North-country scene. A boat laden with bracken is being rowed along a river in the dusk. The reflected light of the waning day is admirably and feelingly painted. F. L. Gloag's curious picture, "The Magic Mantle"—an Arthurian legend—is mystical and clever. It represents a boy who came to the court of King Arthur "with a magic mantle which no wife could wear who was not true to her lord." T. C. Gotch has no one symbolic picture of the interest excited in his last few works. The large picture in No. VII. Gallery, called "The Awakening" (511), is scarcely as clever as the "Heir of all the Ages." It represents a vision of three angels appearing to a waking girl, who is sitting at the side of her bed. The interior appears most like the interior of a convent dormitory. Over the bed hangs a crucifix, and we just see the corbels of the roof. The colour is decorative, and the painting exquisite in finish and reverential in character. The large portrait group "The Children of L. Breitmeyer" (375) is flat in painting, and is in a subdued colour. The children are playing with toy-soldiers on a small fancy inlaid table. H. W. B. Davis's sunny landscape "Under the Greenwood Tree" (387), a slope of rich meadow land chequered in sunlight under wide-spreading trees, through which the sun casts flickering gleams of light and shadows, while a number of deer are disporting in the shade, is, without doubt, his best work. There is much in this gallery that is commonplace. Some of these are "skied," but it would have been better if they had not been hung, and had given place to others. Next after H. W. B. Davis's "Under the Greenwood Tree," is Joseph Farquharson's "As the Shades of Evening Close"; there is a true poetical feeling in the landscape. The painter represents dusk, and his colouring and reflected light on the darkening landscape and carthorses are most tenderly painted, full of fine tone. It is one of the finest landscapes exhibited. On the opposite side of the room we see a very different handling. It is by Adrian Stokes, and is called "Mountains and Hill." The hills are painted in a flat, broad manner; but the result is an effect of light and openness that redeems its bareness.

One of the most delightful seapieces is Edmund G. Fuller's "Bowl Cove, Cornwall" (402), the sunlight on the waves and foam is very frosh and sparkling in its naturalness. W. Dendy Sadler paints one of his quiet country parlour scenes, "The Young and the Old" (400), a group of country gentlemen finishing their repast. Ale and bread and cheese are on the table, and a young waitress is decanting port out of an old crusted bottle. Remains of a meat pie appear on a side tray, and one old gentleman is taking a pinch of snuff. The picture

is admirable for its quiet humour and accessories. His other and more striking picture in the next gallery is called "A Little Mortgage." In a well-furnished lawyer's office lined with books a young smirking, thriftless dandy, cane in hand, sits opposite an elderly solicitor, who has a large parchment before him, and is casting an astonished glance through the corners of his spectacles at his client, who with perfect nonchalance, and in a light jaunty manner, is confiding his affairs. The two men are exact opposites: one is businesslike and reserved, the other a reckless, thoughtless spendthrift, whose chief object is to raise money.

Breadth and good colour are also seen in Ernest A. Waterlow's "A Moorland Road," an effective landscape, and in C. E. Johnson's landscape (432) "Through the Forest," sunlit trees and river. One of the few figure-subjects not equal to C. E. Perugini's work is "Idleness," a dark Italian girl feeding a swan with cherries. In the next gallery, T. B. Kennington's "Diana" (436) is a composition of hardly the ideal treatment we expect to find in a classical theme. The half-draped sleeping goddess and her attendant nymphs are in a wood. The colouring is exceedingly rich though harmonious, but the painter is more successful in his portraits. Near it W. H. Margetson, in "Castles of Sand," has a graceful subject: a girl seated on a sandy beach, listlessly piling up a small mound of sand. The light and colour are admirable, and the idea of girlish fancy is pleasingly rendered. Peter Graham's "Lashed by the Wild and Wasteful Ocean" (445) is a companion subject to the one we have noticed, "The Grass-Crowned Headland of a Rocky Shore" (420). In this a rocky buttress of the coast stands out, the dashing waves are relentlessly being beaten through the natural opening, broken into fine foamy spray. There is freshness and atmosphere in this vivid realisation of sea-beaten coast and the surf. The colossal picture, or rather tempera design, of Seymour Lucas, representing "William the Conqueror Granting a Charter to the Citizens of London," given by the Corporation to the Royal Exchange, is a boldly-conceived piece of decorative painting which dwarfs by its size and colour the other easel pictures. As one of a series of decorative subjects for this great City Exchange, nothing can be more effective. It is broadly treated, and the central figure of the Conqueror granting the charter to the kneeling official, the standing figure in cardinal's robe, and the retinue of the king are rich in colour, and are relieved by the massive stone Norman background of the interior. The painter has not lost sight of the importance of a decorative scheme of colour and treatment. Thomas Mostyn's "The Cloud" is Constable-like in handling and colour, and the painter has given a faithful picture of cloud effect on a landscape; but why so large a canvas? J. H. Lorimer's "Shelling 'Honesty'" (467), a large interior with portraits of a lady and her children, is wasteful, and the perspective and accessories of room ill-drawn and meagre. John R. Reid has a large picture too, in his brilliant open-air manner, vigorous in its realism. "Hiding the Deserter" has a touching side. The tearful maiden, who is standing before an open shed in which the deserter has hidden himself, tells its own tale. Beyond, we see the red-uniformed soldiers sent in pursuit, and they are being directed another way by the mother, who is doing her best to save her son. Carolus Duran's very sumptuous length portrait of "The Countess of Warwick" (484) shows the young countess in black, holding a large white rose, against heavy scarlet plush hangings; but his most important portrait group is "Madame Georges Feydeau and her Children," a picture that was at the Champ de Mars last year, a delightful and sympathetic arrangement of the figures, and equally charming in colour. The steel-coloured satin-frocked little girl, with her white rose and loose petals on floor, is daintily painted.

Nice feeling is shown in Owen B. Morgan's "Evening." Robert W. Allan sends one of his masterful seapieces in "Winter Storm" (492), a vigorous and powerful rendering of a storm-swamped jetty and disabled vessels. Arthur H. Buckland's "Returning Home at Evening" (504), a picnic party coming through a wood in the dusk, is painted with feeling, and we must note the historical incident in Robert Hillingford's picture, "Summoned to Waterloo: Dawn of June 16, 1815," and Fred Morgan's children's group, "The Sunshine of His Heart" (497).

Two or three subject-pictures are in the next gallery. Walter Langley's "A Cousin from Town" (522), a courtyard of a fisherman's cottage, a little fellow playing the banjo to his old uncle and young cousins, is handled with the same conscientious care and sympathy we expect from this leader of the Newlyn school. The large picture of "Wreckage" (529), by C. Napier Hemy, hoisting up some broken masts on a rock by pulley tackle is powerful. The tumultuous sea breaks over the rock as the men are hauling in their "find." The large interior, "Meeting of Burns and Scott" (535), is of interest to readers. The painting of the two chief figures is careful and expressive, and there is a warm rich tone of colour in Charles M. Hardie's work. Lucy E. Kemp-Welch's great picture, "To Arms"—an incident in the camp of the Duke of York's army before the Battle of the Roses at St. Alban's—is vigorous, but less interesting than the greater canvas of the Colts in the New Forest.

J. W. North paints a truly woodland poem, "The Morning Moon" (571), in which all the subtlety of his touch and the harmony of his palette have been combined. The delicate spring-like foliage and the deep blue rushing stream have all the iridescent hues. George Clausen's large vigorous picture of a ploughed field, an old white horse and lad engaged in harrowing, is replete with that strong realism so ably depicted by this painter. The youth is about turning the horse. The sunlight on the horse and landscape is very natural and broadly painted. Robt. W. Allan's picture of a "Fisherman's Haven" is admirable in colour.

In Gallery VIII., H. H. La Thangue gives us another of his strong labour pastorals, "Harvesters at Supper"—a few labourers, men and girls, partaking of refreshment by firelight in a cornfield, is one of his best works. In a more poetic vein is William Stott's picture: "The Happy Valley"—a pleasing study of sentiment. A pretty maiden and her lover stand on the brink of a limpid stream amidst flags and foliage. H. S. Luke has a brilliant seascape, "An Idyll of the Sea"—a boy and girl in a boat on a sunlit sea (621). Solomon J. Solomons' great picture, "On the Threshold of the City, June 22, 1897," at the end of gallery, is a striking episode of the Jubilee procession. The Lord Mayor, in his scarlet and ermine robes, and Col. Burnaby the mace-bearer, the sheriffs on horseback, and a brilliant following are awaiting the Queen at Temple Bar, the decorated street forming a background. The painter has been successful in giving us good portraits, and the grouping and colour are brilliant and picturesque. Frank W. W. Topham's work, "Rescued from the Plague, 1665," tells its own tale. The child of a citizen, a saddler, is being rescued by a friend from a window. All the other children have perished from the plague, and the mother is handing her naked girl into the hands of the rescuer. The subject is painted with care. The rich, carved bay window, the doorway bearing a red cross and the words "Lord, have mercy upon us," are eloquent details. Another brilliant picture is "Sparklets," by Robert W. Macbeth. The scene is the interior of a large skating-rink or ice carnival. Girl skaters in brilliant fancy costumes are whirling round on the ice. They hold rich drapery in their gyrations, and many gaily-dressed men and women in galleries and on the ice make up the scene. The painter has imparted the sense of rapid motion to the scene. The Hon. John Collier's large picture of "Trouble" is pathetically painted.

MODEL SPECIFICATIONS.—XII.

TERRACOTTA—(*continued*).

WE now proceed to specify other details for which special care and finish in execution are necessary. Our sketches include an arched doorway with broken curved pediment and ornament; a bay window with quadrant end lights; an oriel or corner window projecting on corbel; and internal decorations. We refer to previous general clauses.

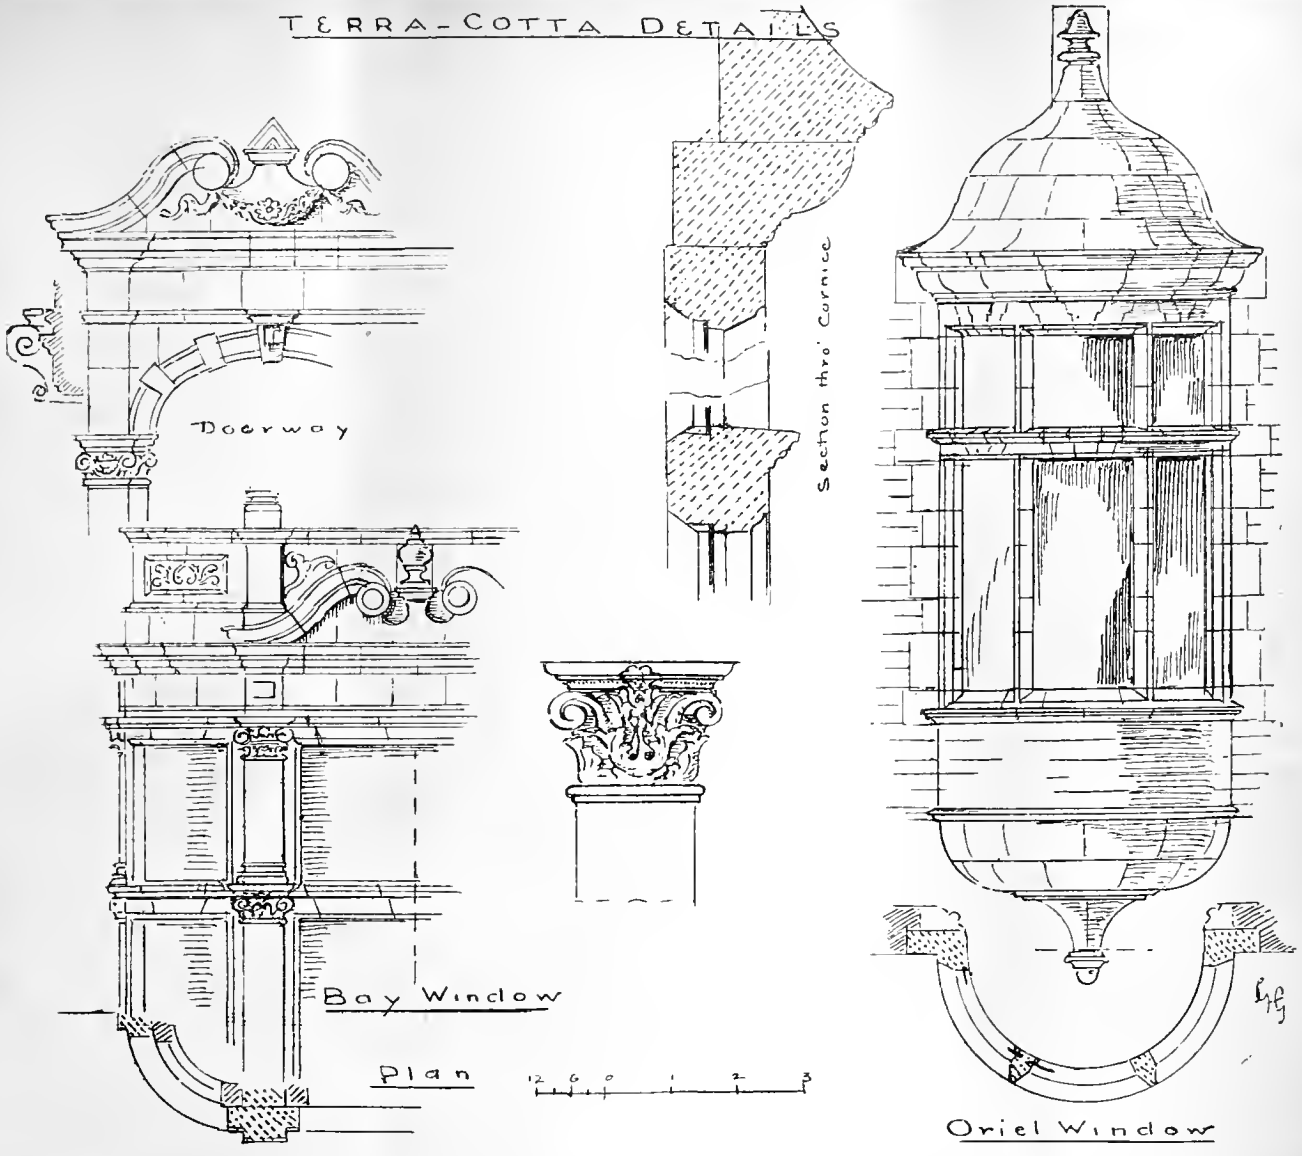
11. *Doorway.*—The doorway or entrance shown in the architect's drawing to be set out full size by the contractor, and be approved by the architect, and supplied to the manufacturer (J. C. Edwards, Ruabon, Doulton, or Hathern Station Company). The several parts, mouldings, and enrichments to be carefully modelled and jointed in accordance with the drawings. The terracotta work to be well burned and of uniform colour, free from cracks and other defects, and the arrises to be sharp and true in line, and the ornamental work clean and sharp. The side pilasters, plain (or fluted), are to be modelled in pieces 9in. (or 12in.) high and a foot or 15in. deep, to bond with brickwork, and to project 4in. (or 6in.) from the face of work; the spandrels to be of terracotta, 4½in. or 9in. deep, and to be well bonded to the brick backing, and flushed on with mortar. The moulded cornice and curved pediment end mitres to project from face of terracotta work 6in. (or 9in.), and to be well pinned into wall in cement, and jointed as shown. The elliptical arch to be carefully turned, and the arrises and mouldings kept sharp and true, and to be jointed where shown. The capitals to pilasters and keystone and the tympanum ornament to be modelled from architect's detail (or be selected from Edwards, Ruabon; Cliff and Sons, or Doulton, Lambeth, and to be approved by the architect), and to be clean and well relieved. No piece to be cut, chipped, or filed to remove the vitreous skin. The whole to be set in fine mortar, and the joints to be not more than $\frac{3}{8}$in. and neatly weather-pointed. Clean off jambs to receive wooden frame. If necessary to describe size of pier-caps and entablature, the clause may read—

The cornice, &c., to be 12in. high, 9in. projection, and 18in. on bed, and the pier-caps to be, say, 14in. by 14in. by 12in., as in margin.

12. *Bay Window.*—The projecting quadrant-ended bay window to be executed in well-burnt red (or cane-coloured) terracotta of approved manufacture (or from Doulton's, Lambeth). Careful full-size drawings to be made from architect's design, and the mouldings and enrichments to be carefully modelled and jointed in accordance with the same. The mullions or pilasters to be formed of solid (or hollow) blocks, each 9in. high and 9in. (or 12in.) on bed, dowelled together in cement (or filled up with fine concrete as the work proceeds), and to have caps and bases, as shown in sketch, left clean and well relieved. The transoms to be in pieces, with joggled joints, as shown. The quadrants or sills and curved transoms to be formed of pieces accurately fitted and dowelled together in cement, and the curved moulded cornice, &c., over to be jointed in small pieces; the mouldings and arrises to be kept true and sharp.

The ornamental pediment and tympana to be artistically modelled and jointed to the architect's satisfaction, and to be left clean and sharp. The joints to be $\frac{3}{8}$in. wide, and neatly pointed in coloured Portland cement. The curved portions and transoms to be supported during erection on wooden frames, and clean off and straighten the reveals of window to receive wooden sash or casement frames, and cut the brickwork to receive the heads, transoms, and sills, and pin with cement.

13.—*Oriel Window.*—The projecting or oriel window (see sketch) to be executed in well-burnt red (or buff) terracotta, made by Edwards, Ruabon, or other approved manufacturers. Full-size drawings of the corbelling and half cupola are to be made from the architect's design by the manufacturer, with the assistance of contractor and



approval of the architect, the pieces of each course to be carefully moulded or modelled to accurate curve and bevels, and after "firing" are to retain their truth of form and sharpness; all mortises, grooves, joggles, and projecting parts to be prepared before the burning, so that no cutting or filing is to be required afterwards. The corbelling supporting the window is to be securely bonded or pinned into the wall, the corbel and course (or two) above it to be "tailed" into the wall at least 9in., and to be counterweighted by a rolled iron joist to carry ends of joists. Every piece or block in each course to be dowelled in cement and the horizontal beds to form grooves and tongues (or the courses to have joggled joints) set in cement mortar with close joints not more than ¼in. thick. Each course to break joint, and to be well tailed into wall at least 9in. The mullions to be 6in. wide by 8in. deep, and to be formed of pieces not more than 9in. in height, dowelled together. The transom and head to have radiating joggled joints, as shown in detail, and the half cupola to be executed in courses and constructed in the same manner as the corbelling, set in cement and weather-pointed as the work proceeds. (If the oriel is large and heavy, an iron or chain band should be let into the upper course of corbelling or at the springing of cupola and bolted through the wall at the end.)

14. *Cupola.*—The cupola shown in sketch (p. 591) is to be built of well-burnt terracotta free from all cracks and other defects (or supplied by Doulton and Co., Lambeth, Stiff and Sons, Lambeth, or Edwards, Ruabon). Proper angle arches to be turned at the top of square tower for the octagon base, which is to be faced with terracotta 4½in. thick, well bonded and grouted in cement; the piers or columns at the angles of octagon are to be carefully modelled from the full-sized drawings prepared by architect (or contractor), and to be of pieces 12in. high and of the section shown, with projecting piece to form bond with brickwork (see plan A, p. 591), made hollow and filled in with lime concrete as the work proceeds (or the columns to be cylindrical solid shafts, with dowels cast on to fit into corresponding mortises below in cement, bonded at every other course to the pier). The arches to be turned and jointed as shown, with keystones, and the entablature to be according to detail in two courses, 12in. (or 18in.) high, the pieces to be cramped together, and to prevent spreading or thrust a copper chain to be let into a groove in the upper course, or the upper part of peristyle to be tied by iron rods let into each corner and secured to a central ring (as shown by detail). The cupola to be executed in shaped blocks of terracotta dowelled together every third course, and well bonded into wall. The lower courses to be cast hollow, and to be 15in. (or 18in.) on bed, gradually diminishing to 6in. at the upper part. Carefully set out moulds to be made, and the blocks to be true in line and surface after burning, and no cutting, filing, or rubbing done afterwards. The whole of the work to be set in cement, and the joints are not to exceed ¼in. in thickness, and to be neatly pointed with a bevelled joint.

15. *Niches.*—The niches (shown in drawing) to be executed in well-burnt red or buff terracotta, free from cracks and other defects, the pieces for which are to be accurately modelled from full-size details, allowing for shrinkage. The blocks to be laid in courses with radiating joints set out with proper bed-moulds and face-moulds (see sketch). Each piece to be 4½in. at its thinnest part.

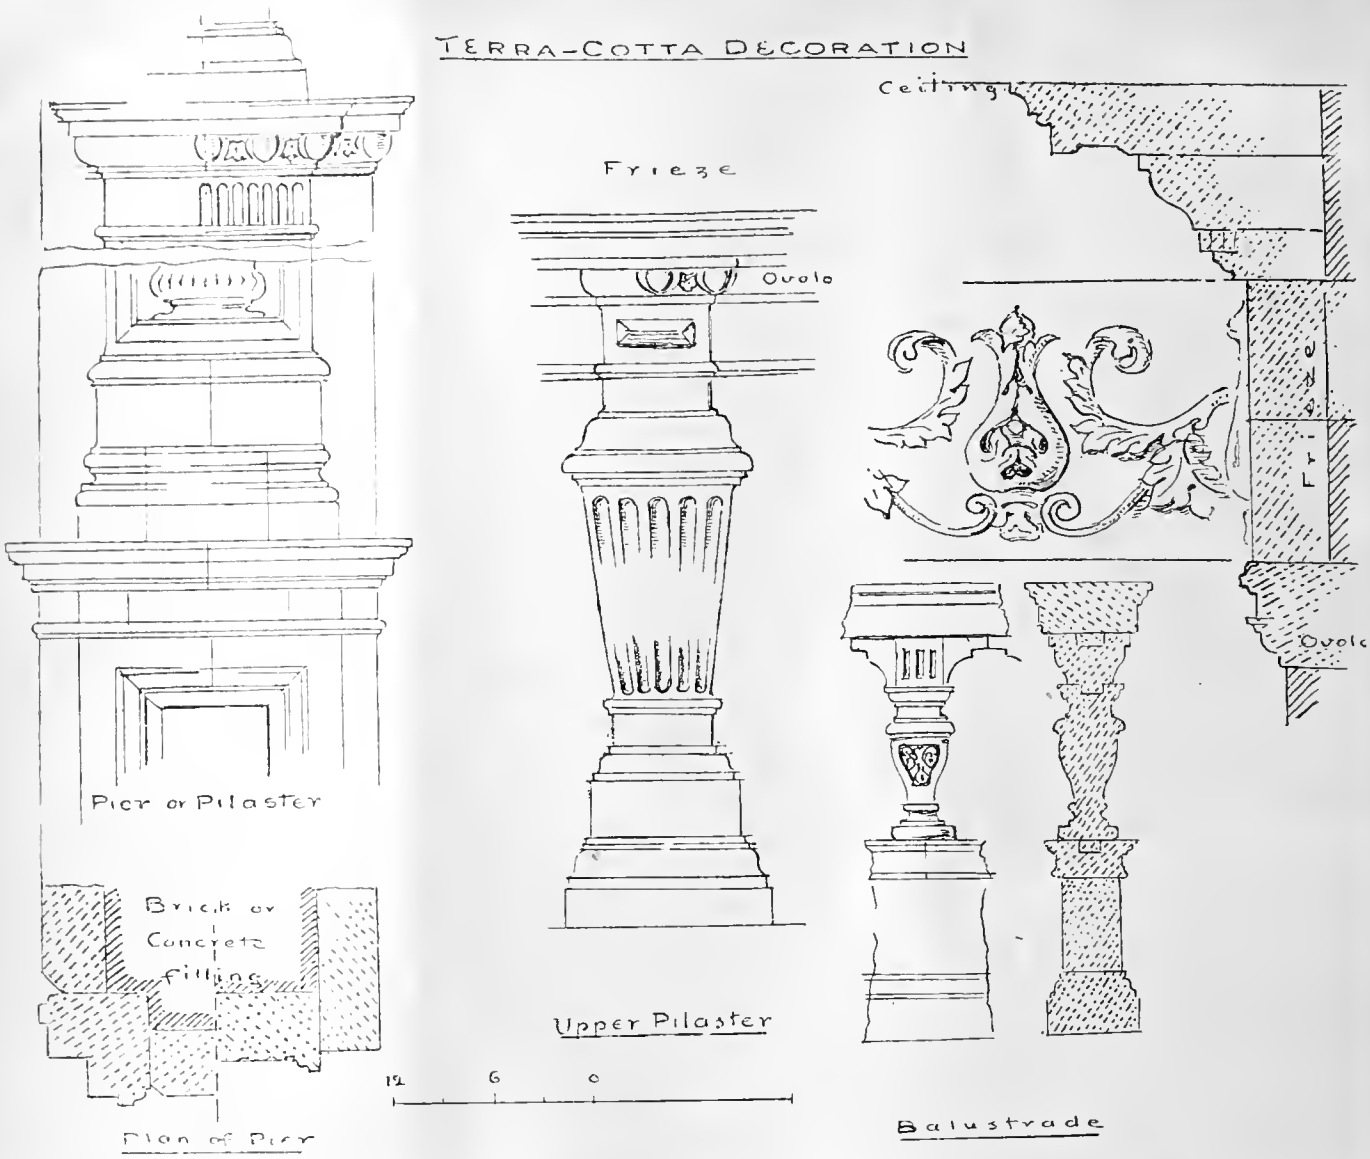
16. *Chimney Tops.*— Fix Doulton's or Edwards, Ruabon, Stiff and Sons', Cliff and Sons', or Hathern Station Brick Co.'s red (or buff) chimney tops (Nos. 21 or 26), or Barham's patent smoke-preventing chimney-pots, price 8s. 6d. each.

17. *Chimney Shafts.*—The chimney stacks (here describe if square, octagonal, or circular), to be carefully modelled according to design and to be executed of well-burnt red (or buff) terracotta, free from cracks and other defects (or specify any particular number or design from Doulton's or Edwards's catalogue), and to be true in shape and line after burning. The flues to be 9in. (or 12in.) diameter. The shafts to have panels or pilasters externally, and to be in pieces not more than 12in. or 18in. high, grooved and tongued or dowelled at the joints, and set in cement mortar, and neatly pointed. Or—

The chimney-stacks to have courses or bands of buff terracotta 9in. high every four courses of brickwork, with moulded caps, as shown in design, of hard burned terracotta (or the chimneys to have red or buff terracotta tops. No. 433 or 455A of Edwards, Ruabon). The tops to be well burned, true in line, and be fixed in Portland cement and flaunched round base. Or—

The chimney-shafts to be built of terracotta in cement mortar. The capping to have one or two moulded courses (see drawing). The upper course to project 9in. and 12in. high, and mitres at angles, and each flue to have a terracotta pot, p.c. 3s. 6d., bedded and flaunched round in cement.

Our second series of sketches illustrate the decoration of a hall or vestibule, executed in terracotta or faïence, and partly taken from Mr. J. C. Edwards's catalogue. We show on the left a pier or pilaster, which may be isolated and carry arches, or project from the wall. Our paper limits prevent us showing the whole height of pilaster, and we give only the dado, base, and capital, with a small order of baluster-shaped pilasters above (see sketch in centre). The main pilasters are supposed to have some kind of relief ornament or arabesque, the upper ones are fluted. The plan shows the mode of encasing the brick piers with the terracotta. The main frieze and cornice is sketched on the right-hand corner, and a balustrade of a staircase or balcony shows the mode of fixing the pieces by dowels, a plan that may be adopted in jointing, columns, mullions, and other features. In work of a decorative character great attention should be



paid to the truth and accuracy of the pieces, so that after they are burned they may fairly be equal to the models. Warped or twisted blocks are disappointing, and, as a consequence, in fixing them it is difficult to obtain fine joints or truthful line or sharp arrises. Any chipping or filing destroys the vitreous skin, which is objectionable for outdoor work, and ought, if possible, to be avoided in interior. By having plenty of joints, and using small pieces, much accuracy may be attained. It is impossible to expect accurate work or fine arrises if the models are not prepared from full-size drawings made under the supervision of the architect, and allowing for shrinkage.

The clauses for internal terracotta work will follow the same lines as those already given; but, if anything, truer and more accurate workmanship and setting are required.

Faïence is largely used for internal decoration, as in the lining of restaurants, vestibules, and other purposes. The clauses we have given for terracotta may be applied to faïence, as the blocks are made in a similar way; but the architect should more particularly specify the tints or shades of colour, or, what is better, ought to have samples deposited with him by a good firm, and require that the work executed should be equal to the samples. Neatness and accuracy in the jointing and fine sharp arrises are most essential, though rarely found. The sketches we have given for terracotta will illustrate this sort of work, and the jointing is similar.

Glazed or enamelled brick is used for a variety of ornamental face-work, such as to bath-rooms and lavatories, vestibules, fishmongers' shops, dairies, restaurants, or dados of hospital wards, &c. Excellent glazed and enamelled bricks are made by J. C. Edwards, of Ruabon, made from selected clays, the coloured glazes being fired at a great heat, which is essential for durability. A clause suitable for this kind of work may be as follows:—

18. *Glazed Brick Wall Facing.*—Face walls of kitchen or vestibule with salt-glazed bricks, pointed in cement: or the dado to be faced with red buff, chocolate (or other coloured) glazed facing bricks of Edwards, Ruabon, with neat joints ¼in. thick, and all headers to be unbroken, with brick moulding 3in. or 6in. deep at top, and skirting as per sketch. The brickwork to be pointed with a flush joint in tinted mortar or Parian cement, and to be approved. The frieze to be of selected pattern 6in. (or 9in.) deep, or line the walls with ¾in. cream or buff glazed tiles in 6in. squares, set in cement on a backing of Portland cement and sand, with a dado border 6in. and skirting 12in. high, pointed in coloured Parian.

Glazed and enamelled bricks are made in every variety of tint, and are made glazed on one side or one end, or on one side and one end for a return angle: they are made also with two sides and two ends glazed or one side and two ends. The best salt glazed bricks are in stretchers and headers. For dado mouldings, corners, &c., bull-nose bricks, chamfers, coigns, and other bricks are made glazed, and can be supplied by several leading manufacturers.

The foundation-stones of a new Wesleyan Church, situate in the Poole-road, Bournemouth, costing £5,000, were laid on Friday afternoon.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XXIII.

By an Assoc. Inst. Elect. Engs.

INCANDESCENT LIGHTING.

INTRODUCTION AND ELECTRIC HEATING.—The problem of lighting houses and streets is a very important one, and we need scarcely remind students that "heat lies at the root of all systems of artificial illumination." Bearing this in mind, it is evident that the electric light, although sometimes called a cold light, is an example of the heating effect of an electric current: and when we remember that the temperature of a conductor is always raised to a greater or less extent when traversed by electricity, it is obvious that the existence of the electric light is due to the intense heat which the electric current is capable of producing. To trace the connection between the electrical energy absorbed and the thermal energy generated, we must remember that electric pressure is lost whenever a current of electricity traverses a conductor, and also that the lost volts are numerically equal to the product of the current passing, and the resistance overcome, or algebraically that $e = CR$. For our purpose it is very instructive to consider this loss as being due to the production of a back pressure of e volts, in consequence of the passage of C ampères through a conductor of R ohms resistance, as then it is evident that a definite amount of energy is developed. To provide for this production of energy, there must be an expenditure of energy equal to eC watts, and since $e = CR$, it is clear that—

Expenditure of energy $= eC$
$= C^2R$ = energy developed.

Now, this amount of energy which is developed is in the form of thermal energy; and if H

denotes the total amount of heat developed in t seconds, we have, by Joule's law—

$$H = K \cdot C^2 R t \ldots\ldots\ldots\ldots (\alpha)$$

—where K is a dimensional constant, the value of which depends upon the units used. If C be given in ampères, R in ohms, and H in calories (a calorie being that quantity of heat required to raise 1 gramme of water through 1° Centigrade), then K is proved by experiment to be 0·24. Furthermore, an activity of 1 watt is 1 joule per second, so that the work done by C ampères in t seconds whilst traversing a conductor of R ohms resistance, will be $C^2 R t$ joules, and consequently 1 joule is equivalent to 0·24 calorie. Now, electric heating possesses many advantages over other forms of heating. For example, it is evident from an inspection of the formula $H = K \cdot C^2 R t$, that the amount of heat developed can be both perfectly controlled and localised. By adjusting the values of C and R, for instance, the amount of heat developed per second may be varied between wide limits, and by concentrating the resistance at the parts where the heat is desired, it may be readily manifested at those parts, and at those parts only. Consequently, the ratio of the energy *used* to that *transformed* is very high. But since the most important application of electric heating is the production of artificial illumination, we are, for the present, only concerned with the determination of the amount of electrical energy expended in producing thermal energy so that sufficiently high temperatures may be obtained as to produce light. If we take into consideration the thermal capacity of the material forming the conductor heated, we may express the connection between the heat developed and the temperature to which the conductor is raised in a given time t by means of the following equation :—

$$H = m\theta \ldots\ldots\ldots\ldots (\beta)$$

where θ is the resulting temperature, and m is a coefficient depending upon the material used, the nature of its covering, and environment. Then, again, any substance heated imparts energy by radiation or wave-motion to the surrounding ether, and if the frequency of the wave-motion be sufficiently high, as is the case when a conductor is raised to the temperature of incandescence, they affect the eye as light, so that of the total amount of radiant energy emitted by a conductor raised to a high temperature, a definite portion consists of luminous energy. Now, by Stéphan's law, the total amount of radiations in unit time emitted by a heated body is—

$$L = s \varepsilon \tau^4 \ldots\ldots\ldots\ldots (\gamma)$$

Where L = total flux of radiated energy ;
s = surface of the conductor heated ;
ε = the total absolute emissive power ;
τ = its absolute temperature.

It is therefore evident, by comparison of equations (β) and (γ), that to produce a given amount of radiations, under given conditions, the energy which must be expended diminishes rapidly as the temperature rises. And, as would be expected, the ratio of the luminous energy emitted to the total amount of radiated energy also increases with the increase of temperature, it follows that the required expenditure of energy corresponding to a given amount of luminous effect diminishes greatly as the temperature increases. For lighting purposes, therefore, all that is required is that electrical energy must be supplied to raise the conductor to such a temperature that the amount of energy radiated equals the amount of energy generated in the conductor, in which case the temperature of the conductor remains constant. In many cases this point coincides with that of incandescence, and then the luminous effect is that desired. And as the fusing point of different materials varies, the question, therefore, of the material to use as a conductor for the production of electric light is a very important one, and will be referred to later.

From equation (α) it is obvious that a body may be heated to any degree by making either C or R sufficiently great ; but when we consider the economical side of the question, large currents are readily seen to be undesirable. They would necessarily require massive conductors for distributing purposes, and this would mean excessive initial cost of mains, in consequence of which the cost of electric lighting would be prohibitive. The alternative, therefore, is to make the conductors which have to be heated of high resistance, and to use smaller currents. In fact, the fundamental principle adopted in all systems of electric lighting is to *distribute* and *concentrate* the resistance of a circuit at those points where light is desired, and at which the heating effect will be manifested to so great a degree that they become luminous, whilst the connecting parts of the system remain practically cool. Electric lamps are, in fact, simple transformers for converting electric energy into thermal and light energy at a number of points in a circuit. There are two types of electric lamps, (1) *incandescent* or *glow* lamps, and (2) *arc* lamps.

The essential part of an incandescent lamp is the conducting filament made of carbonised material, which is heated by the passage of a current of electricity, until its temperature is so high that it becomes luminous. The carbon filament is supported in a glass inclosure in which as perfect a vacuum as possible has been obtained. The object of the vacuous inclosure is twofold : (1) it prevents oxidation of the carbon filament, and (2) it diminishes the loss of heat due to convection. Means also exist for connecting the filament to an electric circuit. And when we remember that no light lends itself so readily for illumination purposes or produces such pleasing effects, and that it may be soft and yet brilliant without glare, that it is clean, cool, safe, and healthy, and that it may be placed anywhere, it is not surprising that incandescent electric lighting has developed so rapidly and is universally desired. Its growth has been phenomenal ; but we can only refer in brief to the early history of the development of electric lighting, although no page of history is more interesting or instructive. Probably the earliest record of a continuous light being produced by means of electricity was the announcement made by Davy, about the year 1800, that he had been able to produce an electric arc between two carbon points interposed in an electric circuit. During a demonstration given by Davy in 1810 at the Royal Institution, a battery of 2,000 elements was used to produce the arc.

As regards incandescent lighting, the first record of anything like a modern glow lamp was the application for a patent granted to J. W. Starr, of Cincinnati, in 1845, in which mention was made of a carbon burner heated to incandescence in a vacuum. It was not, however, until Professor Crookes had improved the method of producing perfect vacua that much real progress was made, and the lamp of to-day embodies ideas from each of the following workers :—Lane Fox, Swan, Edison, Maxim, Sawyer, and Mann, who individually did much to produce a satisfactory and commercial lamp during the period 1878-80.

Manufacture of the Incandescent Lamp.—As might be expected, considerable difference exists as to the details of the processes employed in manufacturing glow lamps, although the main principles are identical, and we shall find it convenient to divide the manufacture of an ordinary incandescent lamp into three distinct processes—*i.e.* (1) the manufacture of the filament ; (2) mounting, or the fixing and supporting the filament in a glass bulb, so as to make perfect connection with the electric-light mains ; and (3) the production of a satisfactory vacuum.

Considering the most essential part of a lamp *i.e.*, the filament—first it will be obvious, from what we have already said, that the filament of an incandescent lamp should possess several essential qualities if intended to form a source of light by being rendered incandescent by means of an electric current. The qualities which are indispensable are as follows : Infusibility, or at least a very high fusion point, high electrical resistance, electrical conductivity, high emissive power, homogeneousness, rigidity, durability at high temperatures, and elasticity. So far as is known at present, carbon alone may be produced so as to possess all these properties to the requisite degree. Many metals, for instance, possess sufficient resistance, and are cheap and easily produced ; but their melting points are too low. Of the metals, platinum and iridium alone have been used as the filament of a lamp, and, although platinum may be raised to a brilliant white heat before its temperature of fusion is reached, there is not sufficient margin between the temperature at which it is incandescent and the temperature at which it fuses to permit of it being used on a commercial scale for lamp filaments. Then, again, the electrical resistance of all conductors, with the exception of carbon, increases with the temperature, and it is a significant fact that whilst carbon naturally possesses the requisite qualities of an incandescent lamp filament to a higher degree than any other known substance, its *electrical conductivity increases* as the *temperature increases*, and, as a general rule, the *hot* resistance of a carbon filament is *half* the *cold* resistance.

In all cases carbon filaments are produced by the calcination of carbonaceous substances at a high temperature while out of contact with air, and the carbonaceous materials used may be divided into two classes—*i.e.* (1) *those containing carbon in a free state*, such as pure (retort) carbon ground to a powder, and formed into a paste by mixing it with a hydrocarbon liquid, tarry syrup, or a solution of sugar ; sometimes a mixture of lampblack and tar is used : and (2) *those containing carbon in a state of chemical combination*, such as silk, hair, woody and vegetable fibre (bass fibre and many kinds of grass), parchmentised paper and cotton, or pure cellulose ($C_6H_{10}O_5$). Probably those of the second class are more commonly used than those of the first-class. Edison, for instance, used bamboo fibre, obtained by the aid of special machinery, and as it is rich in carbon, has a straight grain, and possesses great tensile strength, it has been found to answer exceedingly well, being strong enough to withstand the pulling and twisting whilst reducing it to the desired size and proportions. Swan, after having tried parchmentised paper, used parchmentised cotton, which was prepared by immersing cotton-thread in a solution of sulphuric acid and water (of specific gravity 1·64), after which it was thoroughly washed to get rid of the acid. The more common process, however, consists in forming pure cellulose by dissolving cotton-wool (which is almost pure cellulose) in a solution of zinc chloride (of specific gravity 1·8). The resulting viscous solution is then forced through a small hole into a vessel containing a liquid in which it is insoluble, as, for instance, alcohol, which causes it to set and harden. Whilst it is in this condition and before it has thoroughly set, it is forced through dies from which it comes out in the form of a thread or filament. It is worthy of remark at this point, that inasmuch as cellulose is the chief constituent of the vegetable products—cotton and linen thread, paper, &c., the result of parchmentising cotton (Swan process) is to produce a tough, horny thread of cellulose in a gelatinous semi-transparent state, so that by either process an identical substance is formed. After the threads have been thoroughly dried, they are drawn through a series of jewel dies to reduce them to a uniform diameter throughout — *i.e.*, that required, and at the same time to polish them.

The next step, common to all methods of preparing the filament, is to carbonise or to convert them into a homogeneous solid carbon filament at a high temperature. This is a very important process ; and generally the filaments receive their shape at the same time by being wound on blocks or moulds of carbon of the shape required. The blocks on which the filaments have been wound are then placed in graphite crucibles, either by placing them directly in pulverised carbon, or in cases lined with charcoal dust, or they may be wrapped in cotton rag, or they may be simply separated by pieces of cardboard ; in all cases a carbonaceous powder covers the contents of the crucibles, so that all the spaces are filled, after which the lid is fastened on by means of fireclay, so as to insure air-tight joints. They are then ready for the furnace, which must be specially constructed of the best refractory bricks, so as to withstand a temperature of 1,600° to 1,800° which is required for the carbonisation process. And since so much depends upon the carbonisation, every care has to be taken to avoid sudden variations of temperature, and to subject them to a gradually increasing temperature until the highest temperature for which the furnace was constructed has been attained. When we remember that the heated carbonaceous powder covering the filaments absorbs any free oxygen present in the crucible, and also the gases which are driven off from the filaments as the temperature rises, and that it is this process, in fact, which drives off everything from the filaments which is not carbon, and leaves as a residue a very pure form of carbon, homogeneous, hard, and durable, with sufficient elasticity to withstand vibration, it will be obvious that this process of calcination demands care, especially since the chemical decomposition produces contraction of the filament, amounting to about one-third of the length and diameter. Not only must the temperature of the furnace be increased gradually, but it must also be cooled gradually after the desired temperature has been reached, and it is not until the crucibles are cool enough to be

removed from the furnace by hand that they are touched. The carbon filaments are now very fragile, and it is imperative that they are carefully handled whilst being removed from the crucibles to air-tight and dust-tight boxes, in which they are placed until subjected to the next process of flashing.

It will readily be understood that in the early days of lamp-filament making much experimental work had to be performed, and that the filaments were not so regular as we should now expect them to be. It is clear, however, that if the diameter varies at different points of the filament, there would be parts of the filament differing in resistance, with the result that the filament would be unequally heated when a current was sent through it, and not only would the filament be raised to different degrees of incandescence, but there would be the possibility and probability of the filament giving way at these weak points. To equalise and regulate the section of the filament, Maxim introduced the process of *flashing*, and although it is not now so necessary to flash the filaments, it is usual to subject all filaments to this process to insure homogeneousness, improved electrical conductivity, and a less tendency to disintegration.

The filaments having been cut to the desired length, the process of flashing is conducted as follows:—The filament is supported by spring clips or contacts, insulated from each other in a vessel completely filled with a hydrocarbon liquid or vapour (ordinary coal gas), connection also being made by means of the contact-pieces to a suitable source of electrical energy—i.e., dynamo or battery of accumulators. Means also exist for varying the current (a variable resistance being connected in series with the source and filament), and for making and breaking the circuit as desired. The current is first adjusted so as to raise the temperature of the filament to a dull-red heat, and if it glows unequally, it is then certain that the filament is not of uniform section. The result of heating the filament is to partially decompose the gas, and to produce a deposit of minute particles of carbon on the filament. And since the quantity of carbon deposited depends upon the temperature, it is obvious that the places most heated receive most carbon, with the result that in such cases the section of the filament is equalised throughout, as is proved by the filament being uniformly luminous throughout. Not only are the weak spots strengthened, but to cover the carbonised filament with a sheath of grey, hard, brilliant carbon of increased density makes it more refractory and of uniform conductivity. The complete process takes but a few seconds, the current being gradually increased until, with a certain maximum current passing, the filament glows uniformly, giving the required candle-power. In some cases the flashing process is conducted after one filament is mounted.

The next stage in the manufacture of the lamp is *mounting* the filament, and in all cases the *leading-in* wires—i.e., those which pass through the glass bulb, and make connection with the external circuit—are always made of platinum. Platinum is invariably used, because it possesses a high fusion point, a similar rate of expansion to that of glass (the coefficients of expansion are the same through wide limits of temperature), freedom from oxidisation, and ductility to a high degree. The method of connecting the carbon to the platinum is usually one of cementation, and it is imperative that two requirements must be satisfied. (1) The attachment must be electrically and mechanically good, and (2) the resistance of the junction must not be high enough to produce undue heating.

In some cases the ends of the platinum wire are tubular, into which the carbon is inserted; in other cases the platinum is flattened out, and the carbon riveted (Maxim's lamps) to it, or cemented by means of a carbonaceous cement, which is carbonised by sending a strong current through the joints. In many instances carbon is deposited on the joint by means of the flashing process, and, as will be evident, many modifications may be introduced in perfecting the process of connecting the carbon and platinum.

The final process is that of exhausting the bulb of air and moisture. As is well known, high vacua may now be readily obtained by means of the Geissler or Sprengel pumps, and it is of the utmost importance that the bulb be thoroughly exhausted, as the life of the filament depends largely upon the degree of the exhaustion obtained. (*To be continued.*)

THE ARCHITECTURAL ASSOCIATION.

THE twelfth fortnightly meeting of the Association for the present session was held on Friday evening, Mr. Hampden W. Pratt, president, in the chair.

REFLECTED LIGHTS FOR INTERIOR LIGHTING.

A paper on this subject, illustrated by numerous diagrams and plans, was read by Mr. W. Eckstein, of the firm of Messrs. Hayward Brothers and Eckstein, of Southwark. The treatment of light, or the proper distribution of daylight to any building, is, said the author, of greater importance than anything else, except, perhaps, drainage, and daylight assists largely in the sanitary conditions and cleanliness of all buildings, whether offices or warehouses. Daylight

1877	1 in 1·9	1 in 2·97	1 in 1·66	1 in 1·54

necessarily is brought in through the windows, and the light that enters the room falls on the floor at an angle up to about 45°, where it is nearly all absorbed, and consequently does not produce the full effect that is required for all offices. The arrangement of windows lends itself to assist or detract from the result obtained, and it will be found well to keep the head of the window as near the level of ceiling as possible; at any rate, not to be more than 12in. below it. The part of a window is practically of little effect if brought within 2ft. of the floor level. The window should be placed so as to give an equal margin of wall on either side as near as possible, and the length of an office should not exceed about twice the height of head of the windows from the floor, which in the ordinary way would be a limit of about 16ft. to 20ft. The general depth of an office should be taken about 16ft., as beyond that distance light is not good, and the extra space loses value, and there is a point where the extra depth can only uselessly increase the size of an office and not produce its proportion of rent. A

USEFUL RULE FOR THE SIZE OF WINDOWS

is that not less than 1sq.ft. for every 85ft. of cubic space and not less than 1sq.ft. for each lineal foot between the window and opposite wall inside should be given. Of course, all such rules would be varied by circumstances, as to whether on the ground, first, or any other floor, and also from what direction the light can be obtained. Generally the height of a window may be half the depth of a room less 2ft., and the width of a window one-third the width of a room. The first point to decide is the

BEST AXIS FOR THE OPEN AREAS

or well openings. Take the average day, and suppose that the sun rises at six, 6.E. will equal 6 a.m., and 6.W. will be 6 p.m. The usual hours of business are, say, from 9 to 5, and then the angle 509, if bisected, will divide the hours of sunlight equally, and it is this line which should rule the direction of the greater length that open areas and well-holes should have. This will be found to be 15° east of north. The open area or court should be made rectangular, not square, and lengthways, north and south. A portion of sunlight (every day that the sun is visible at all) would go into all the windows in the walls during each day, and in some seasons reach the bottom of the well-hole, and, at any rate, it would reach the maximum distance at all times. If in any town the roads have this direction of 15° east of north, and the cross roads are cut at right angles to them there will be a great advantage. The conditions for a successful building for use as offices is: (1) Ease of access; (2) good light; (3) good service; (4) pleasing environment and approaches; (5) maximum rentable area consistent with economy; (6) ease of rearrangement to suit tenants; (7) minimum cost with true economy. For good light, experience confirms the statement that courts should have their long axis north and south. As to the arrangement for good light, it is generally accepted that the requirement is that every portion of the office should be within 20ft. to 25ft. of a window, and that that window should not open directly to the south. It is to be hoped that the disadvantages due to the direct south light to an office will soon be appreciated, and the advantage of a court or open area, with its long axis north and south, more fully understood. Offices, on a bright day, facing to the south have to have the blinds partially closed in order to reduce the glare from the sun, the consequence being the back portion of the office has to be lighted, possibly by gas or other means. Upon valuable sites, where the amount of available daylight is very limited, it is necessary that the least possible space be appropriated as mere open areas for light. To show the difference of opinions on this matter, Mr. Boult, of Liverpool, compiled the accompanying table, which speaks for itself, comparing the different areas so appropriated in five different competitive drawings submitted for the new Stock Exchange, Liverpool, about 15 years since. The plot was 49ft. to Dale-street, depth 197ft., back width 36ft., and the total area 9,195ft., the only street outlet being Dale-street.

REFLECTORS.

Notwithstanding the proper arrangement of well-holes and light openings in the lower floors, it is necessary often to assist the daylight by reflectors. These are so generally known, and their good effect so considerable, that it is only advisable to point out that where possible the reflectors should be fixed at the sill instead of half-way up the window, and be exposed directly under the sky, and the light should be thrown up to the ceiling of the apartment, and if this is polished in hard plaster it will greatly assist to distribute the light throughout the room. Where volume of light is required direct,

LIGHT SHOULD BE ADMITTED VERTICALLY.

The light passing through a skylight is very much greater than that through any vertical window, and consequently the light received from the horizontal pavement-light is much stronger than from a vertical stall-board. It is hardly necessary to dwell on the difference of reflection and refraction, but it should not be overlooked. All rays of light move in straight lines, and when they strike upon any object they glance off its surface and are wholly or partially absorbed, or pass through the object as in a sheet of glass or a body of water. In the first place, the light is said to be reflected, and in the others refracted, because its course is partially diverted from the right line in which it left the luminous body, and its direction bent or broken back according to the difference in density between the two media. The direction in which light is reflected depends upon that from which it proceeds; it is always such that a perpendicular to the surface at the place of impact bisects the angle formed by the arrival and departure of the ray. Each half of the angle represents the angle of incidence or the angle of reflection; those angles are always equal, and always in the same plane; one being known, the other is readily ascertained. The perpendicular is termed the axis of incidence, the first ray the incident ray, the other the reflected ray. It is by the reflection of the rays impinging upon them that objects become visible, and the reflective powers of the objects are very variable. At a perpendicular incidence, water reflects only eighteen rays out of every 1,000, and glass only twenty-five, while mercury reflects 666. When the rays strike the surface obliquely, the reflection is augmented; at an incidence of 40° water reflects twenty-two rays, at 60° sixty-five rays, at 80° 333 rays; while at an incidence of 89½°, where the light almost grazes the surface, it reflects 721 rays out of every 1,000. Thus, as the obliquity increases, the reflection of water approaches and finally overtakes the reflection from mercury, but at no incidence, however

great, is the reflection from water, mercury, or any other substance total. Any beam of light meeting any refracting surface obliquely, it is obvious that one part of the beam will meet it before another; it is thus hindered in its motion by it as wind is hindered, but not stopped, by the trees. In lenses and prisms the emergent beam takes an oblique path, and in the case of lenses, either convergent or divergent (according to the kind of lens), and the position of the lens relative to the object. The principle on which the

MEASUREMENTS OF REFRACTION

are based was discovered by Willebrod Snell. According to Brewster, the index of refraction is—

For glass, two of lead to one of flint	1·830
Plate glass.....	from 1·514 to 1·542
Crown glass	from 1·525 to 1·534
Water.....	1·336

In comparing the lenses used in pavement lights, I assume the index to be 1·5; therefore the angle of refraction, on entering glass from the atmosphere, is two-thirds of the angle of incidence, and on leaving the glass it is half as large again. Referring now to the lenses and prisms that are most useful in

PAVEMENT LIGHTS

and stall boards, shop-fronts, offices, windows, &c., the first kind of glass used in decks or floors was undoubtedly the common "ship's deck light," which is a solid mass of glass with a flange all round to support same in the adjoining floor, and with a heavy drop or triangular wedge on the under side. Whether this drop was originally intended for strength, or for increasing and distributing the light, is doubtful; there is no doubt about the strength, but all the vertical rays are reflected outward again from the sloping faces on either side. We now take practically the same block of glass (which for our purpose is cut in two) and open it outwards, and you will at once see the marvellous result, and it is this principle which has been the foundation of "Haywards' patent semi-prism pavement lights." It will be seen that the vertical, or nearly vertical, ray is thrown out through the upright, or nearly upright, front of the lens at an angle a little below the horizontal, and the rays falling on the top of the lens at various angles are thrown out in a fan shape, and the steeper the back slope, with the nearly upright face a little more inclined, projects the light lower than in the previous case. Of course, such an important result, which can be obtained from a series of prisms grouped in a frame as a pavement light and protected by a patent, has been attempted by various other devices or sections of lenses. These are lying on the table, and the average result can be got by holding them in the hand and comparing one with the other. The result is generally bad, and that the makers of such lenses should have been given a certain amount of encouragement by architects using them shows to a certain extent the comparative neglect in deciding such an important matter as to which is the best kind of pavement light for producing the best illuminating effect in any building. It will be seen, too, that some thought is required in assembling the lenses in a properly-constructed frame, so as to produce a satisfactory result. One section shows an attempted improvement on previous ones, but, unfortunately, there is a great difficulty in making such irregular shaped lenses perfect, when one part is so bulky and the other so thin, on account of the inequality of the glass and tension in the lens, therefore this lens in practice is a failure. This section also limits the size that can be safely made. Now coming to the vertical lights used in stall-boards, or applicable to shop-fronts, windows, &c.: the lenses used are "Haywards' reflecting lenses," which are made at different angles to suit different circumstances. Such lenses are usually employed under the shop or office front. The combined arrangement of pavement lights and stall-boards will be clearly understood from the diagrams shown. It should be noted that if any girder be introduced a very considerable portion of the light would be lost, and a heavy shadow would be cast along the ceiling. Pavement light should be supported by bearers transversely, and as little obstruction or thickness of metal be introduced at the junction of the vertical stall-board with the horizontal pavement light, and this is easily arranged by turning up the back edge of flange, which is generally called a "water bar." Fifteen years ago Messrs. Hayward Bros. fixed in two fronts of ground-floor premises, used as offices, &c., Haywards' reflecting stall-board lights. The result is very effective, and the light often too strong; in fact, it is necessary to place the desks so that the clerks do not face the front light. These lenses can be applied in various other positions, as in lean-to or sloping roofs, &c. The frames of the upright or stall-board lights are sometimes made with rebates to the horizontal bars only or vertical bars only, and in others with a perfectly plain sectional bar without any rebate, with a small button at the intersections to retain the glasses in their position. A combination of several devices, as already more or less explained, can be introduced to such an extent, either single or combined, as may be desired. It will be seen that the upper portion of the windows can be glazed with the reflecting stall-board lenses, to throw the light to the back portion of the ground floor in almost a horizontal direction, or to throw the light slightly upwards on to the ceiling, and thereby illuminate the back portion of the office. There is a great disadvantage in running any transverse girders or beams below the level of the ceiling across the direct line of light, as these girders or beams would throw heavy and objectionable shadows, so that the ceiling, instead of being light and bright, would be shadowed, and the major portion of the reflected light lost. Under the stall-plate, stall-board lights can be fixed vertically, as in the window above, and in the pavement light "Haywards' Semiprism Lenses" fixed horizontally, and these pavement-lights could throw the light on to a stall-board light, fixed as shown when a partition is advisable to divide off the front part of basement, and this would throw a volume of light into the basement. In another sectional drawing, the ordinary daylight reflector is introduced at window-sill on first floor, and near the middle of the depth in well-hole a series of pavement-lights and stall-board lights to throw the light all round same are introduced; the arrangement of lenses throwing reverse ways should be noted. It will be seen that one or two of these plans can be adopted with more or less advantage. Many modifications suggest themselves to architects and others, and the best arrangement can readily be worked out. It will be noted that when light is obtained from definite sources, it must be taken to act in some line of greatest volume, and it is evident that the best light falling on the pavement light will be at about one-third of the angle made by the front of the building, and the line of light from the coping of the opposite building, and from the stall-board lights at about two-thirds. Again, if the street is very narrow and a high building directly opposite, the light can be usefully assisted by other lenses. In all cases, the tops of the lenses of pavement lights and front of stall-board lenses should be plain flat surfaces and kept clean. However, ornamental effects can be given, but this is generally done with a proportionate reduction or waste of light. Also, a more ornamental appearance can be given by tile inlays between the lenses of pavement lights, or a good foothold by a non-slipping material, such as lead, cement, facing, &c. Specimens and samples of such lights are numerous and difficult to show to advantage away from the factory on account of their weight, and where also they can be seen in position.

ELECTRIC LIGHTING AS APPLIED TO ARCHITECTURE.

Mr. Tom Ekin, A.M.Inst.C.E., followed with an interesting paper on this subject. The lecturer explained that he should restrict himself to the engineering side of the question, and that he did not propose to touch upon or refer to the subject of electric lighting outside buildings—that was, upon the generating plant or other sources from whence electric energy was brought into the building or group of buildings—but should confine his remarks to internal lighting and the manner in which the current should be conveyed to the various points of light. Dealing firstly with the distribution of lights, Mr. Ekin continued, it is obvious that the lighting of different classes of buildings requires distinctive treatment, because the lighting of a cathedral cannot be compared with that of a railway station, any more than the lighting of a ball-room or drawing-room can be compared with that of a bedroom or kitchen. Each room or space which it is intended to light should be considered and examined from at least three different points of view, namely:—

(1) The purpose for which it is to be used;

(2) The decorations, furniture, and general surroundings; and

(3) The cost of the proposed lighting.

Which of these three points is the most important is probably a matter of opinion, but it may safely be assumed that the third point, or question of cost, is not the least important; because it may be taken as granted that the skill of the architect or engineer in arranging a system of lighting is in no case more marked or apparent than in getting the maximum lighting effect at minimum cost, this minimum cost including not only the first cost of putting in the work, but the more important one of annual expenditure and renewals. When considering the question of lighting new buildings by electricity, the subject can be treated and considered with a far freer hand and, generally speaking, with far greater effect than in the case of houses at present lighted by gas or other form of illuminant, because one is so very apt to take the positions at present held or assigned to gas as those most suitable for electric lamps, quite forgetting the fact that gas is so non-adaptable and lends itself with such ill grace to artistic effect that there are only certain positions in any room in which it can safely be placed. Now I shall assume as an axiom that the

MOST PERFECT FORM OF LIGHTING
